Industry, defined as "productive labor employed in any manufacture," dates from the improvement of the steam engine by Watt in the latter part of the eighteenth century. Then for the first time power could be developed anywhere that fuel was available. With increasing industrial development water power likewise began to assume prominence. With advancing civilization the domestic manufacture of commodities became insufficient, and with the advent of the steam engine factories sprang up in populous centers. The spinning wheel gave place to the "spinning jenny," and that in turn to the "spinning mule"; the hand loom to the power loom, and the machine shop appeared to supplement the work of the blacksmith and the foundry.

Early in the nineteenth century the necessity for transportation for the increasing output of factory products brought the steam locomotive into being, and railroad construction went steadily forward despite opposition to it as "a device of satan."

In the case of each of these twin agents of civilization, transportation and manufactures, the steam engine was and still is the dominant factor; it is, however, one of those things to which reference was made at the outset whose influence is beginning to wane. Steam controlled and put to work was mainly responsible for the remarkable industrial development of the nineteenth century. Electricity controlled and put to work in a multitude of ways will be responsible for what will prove a more remarkable economic development and a much greater advance in civilization.

power, that made it necessary to apply it at a definite point, with a definite movement as to direction and speed.

Factors in Initiating Design

AS to the first of the two considerations: A person is given the task of designing a machine that will take in material of a certain sort and deliver a certain definite product. The one machine may take in raw material and deliver a finished product, as the machine that receives paper from a roll and turns out an envelope, gummed, folded and stamped, and printed with return card; or a monster printing press that is also fed paper from a roll and turns out a newspaper, printed, folded and counted, at an almost incredible speed. Or the machine, as is more usually the case, may be one of a series, each performing a certain process, as with textile machinery. In the manufacture of ordinary cotton cloth the material passes through 18 machines from the raw baled cotton to the bale of cloth, each machine representing a separate and distinct process.

In starting out to design any machine it is essential for the designer to know

(a) The material to be worked, its character and texture;

(b) Its condition and the form in which it enters the machine;

(c) The condition and shape in which it must be delivered;

(d) The weight or mass of material to be worked while passing; and finally,

(e) The rate of production, which fixes the speed of different parts of the machine.

Before putting pencil to paper the designer must study the problem from A to Z, must make a mental estimate of the different movements and changes of motion, the number of parts, their general shape and size. In assembling these into a connected whole the machine takes form in his mind's eye.

When his mental picture has taken on a definite shape, he takes up his pencil and makes a free-hand sketch, usually several before one is satisfactory; then with this as a starting point he begins a more particular sketch, in which each feature takes its proper position, with some attention given to proportion; at this point the separate design of each is begun. In drawing details to scale, determining the number of parts, the shape, size, strength, movement and speed of each part, the designer continually meets the same handicaps, change of speed or direction of rotation, or character of motion.

With the details of each part settled the machine as a whole is drawn to scale, but not infrequently there results an impossible combination and the design must be revised.

Inhibitions in Providing for Power

AS to the second consideration: Heretofore, in working out the details of any machine, the designer has repeatedly been obliged to devise means to overcome the inescapable condition that power and motion came from a single source. Therefore, it must be initially applied at a single point (except in rare situations) and at a fixed speed. The power, usually with rotary motion, may be applied to the machine by means of a belt, chain, gear or shaft. Within the machine it may be necessary to vary the speed at several points, to change motion from rotary to rectilinear, to provide reciprocal motion, to provide rotary motion with varying angular velocity, etc., and the designer has been obliged to devise mechanical (and sometimes clumsy) means to obtain all these various movements so that each functions positively and in order from the single movement initially applied.

In designing and constructing a new machine of an original type, a manufacturer must start with a long purse, for the expense of the completed machine not infrequently runs into six figures, occasionally into seven. The designing may take months of an expensive force; much research may be required. Then it may be found necessary to rebuild the first one finished. Then comes experimental operation, which may develop the necessity for additional redesign. Sometimes the whole machine has to be scrapped and a new start made.

With the machine perfected and the machine builder's worries over, the purchaser and user begins to have his; first, the machine represents a large investment; second, mechanical complications require expert attention; third, maintenance cost is high; fourth, in the light of present possibilities use of power is inefficient; and fifth, possibly large space is occupied. These conditions spell high cost of product.

Mental Bondage to Established Custom

The adverse conditions enumerated for both builder and user of the machine are due in large part to consideration No. 2, that has rigorously prevailed until lately; yet even to date very little advantage has been taken of the greater technical freedom in machine design, increasingly possible. Mental bondage to established custom has so far proved stronger than technical freedom of action.

The real badness of the mechanical complication heretofore made necessary by the inhibitions imposed by that one fundamental condition (consideration No. 2, the method of applying power and motion) has never been properly sensed, even by the machine builder. There has, till recently, been no other way, so the conditions have been accepted as inevitable and little thought given to them or much said about it.

But the time has arrived when the designer of machinery is in reality emancipated (if he will be) from the necessity of applying power at one point, and motion likewise, of a single character and speed. Will he accept emancipation? He appears to be very slow in doing so. The inexorable character of former conditions governing the application of power and motion to a machine has so powerful a hold—mental attitude with regard to it has become so fixed—that mechanical designers find it difficult to escape its thraldom. Only occasionally will one become so emancipated as to be fully and freely motivated by the—to him—new idea.

Another reason for slow acceptance of the new freedom is that mechanical designers have rarely had any considerable electrical experience. They are more or less in awe of the intricacies of electrical design and so fight shy of it. When of late there has been indicated a close combination of machine and electric drive, the mechanician has used a standard motor, or the electrical feature has been left to the electrical manufacturer.

Since electric motors became a factor to be reckoned with in applications of power some 30 years ago, electrical and mechanical designers have followed parallel though, as a rule, quite distinct courses. Whenever electric drive seemed to be indicated as a more desirable motive power, the electric motor has been used by the mechanical designer, but he has applied this form of power precisely as he would have done power directly from an engine or a water wheel. He has not sensed the basic fact that electric power (the phrase is a misnomer) is not power at all, just a means of transmitting power, the most convenient, serviceable, flexible and controllable in existence.

Electric Motor No Longer an Adjunct

Here now is the great idea. It is possible by the means electricity offers to apply directly at one or several points, without the intervention of mechanical means, rotative movement of 10,000 hp. or 0.001 hp. through a wide choice of speed; also rectilinear motion through a wide range.

And by simple mechanical aids these two basic movements can be varied to obtain other characteristic movements, reciprocating, varying angular velocity, etc.

Although not formulating the present freedom in design till quite recently, the extended experience of the writer in both mechanical and electrical design, made it quite natural to combine the results of such experience more intimately than others have done and then to sense the real situation.

The design of electrical forms and movements is no longer a closed book to all but a few; they are almost as much common property of technicians as the particular features of mechanical design. There is therefore little of a technical character to prevent manufacturers of machinery from combining electrical with mechanical production.

Very distinct changes in method, however, will take place. These are likely to be more complete than is at once apparent. This revolution in manufacturing methods will not come in a day, or a year, but should be much in evidence in ten years. The limiting factor as to time will be the supply of competent designers available.

There are two wise sayings that will throw light on this situation.

"How use doth breed a habit in a man,"

and,

"Habit with him was all the test of truth;
It must be right. I've done it from my youth."

This is the point of view that—with rare exceptions—prevails with experienced technicians. It is because of mental attitude that a mechanical engineer, or master mechanic, is rarely competent to organize the most efficient electric drive, where it is only a question of placing electric motors. This is not an evidence of any lack of ability in his line; it is a matter of mental attitude. He is simply unable properly to interpret a concept of power transmission, not merely different from, but actually at variance with, his regular line of thought. Therefore, there must be time for the demand for electro-mechanicians to develop a new crop of engineers. The only other supply is from the few who have not become rutted in the traditions, precedents and methods of either electrical or mechanical design, per se.

[*In a following article the author proposes to be more specific regarding the implications herein set forth, with an attempt to supply suggestions of practical interest to machinery builders.*]

Pittsburgh Bridge Selected as Most Beautiful Built in 1928

THE most beautiful steel bridge completed during 1928 is the Sixth Street bridge over the Allegheny River in Pittsburgh, according to a jury of awards appointed by the American Institute of Steel Construction.

This bridge was designed by the Bureau of Bridges, Department of Public Works, Pittsburgh, under the supervision of V. R. Covell, chief engineer. It was constructed by the American Bridge Co. and the Foundation Co.

The structure is of the self-anchored suspension type and is 884 ft. long, having a roadway 37 ft. 6 in. wide between curbs in addition to two cantilever sidewalks.

A jury of five made the selection. Two of the jury were named by the American Institute of Architects, two by the American Society of Civil Engineers and one by the American Institute of Steel Construction. This jury was made up as follows:

George H. Pegram, past president of the American Society of Civil Engineers, chief engineer Interborough Rapid Transit Co., New York.

William A. Delano, fellow of the American Institute of Architects, and member of the firm of Delano & Aldrich.

Ralph T. Walker, member of the American Institute of Architects, and member of the New York firm of Voorhees, Gmelin & Walker.

Charles Evan Fowler, member of the American Society of Civil Engineers, consulting engineer, New York.

Dr. J. Horace McFarland, president of the Art Commission of Pennsylvania, Harrisburg, Pa.

It is the intention of the American Institute of Steel Construction to decorate this bridge with a suitable bronze tablet, and certificates containing a reproduction of this tablet and the names of those interested in the construction of the bridge will be awarded. Plans for the ceremonies incident thereto will be discussed at the annual meeting of the institute at Biloxi, Miss., Nov. 12 to 16.

Other bridges came in for honorable mention, among them the High Bridge over the Harlem River in New York, the Cottage Farm bridge over the Charles River in Boston and the Thirty-first Street bridge over the Allegheny River in Pittsburgh.

Thermit Welding and the Steel Mill

Superheated, Gas-Free Steel Carrying a Little Aluminum Solidifies Into Metal Tough as a Forging—Proper Procedure Necessary for Success

BY J. H. DEPPELER

ASIDE from a series of illustrations of repair work done by the well-known thermit process (such as building up worn wabblers, welding breaks in heavy axles, crankshafts, frames, cylinders and bed plates) Mr. Deppeler's paper consisted of a discussion of the nature of the metal in the joint. From this portion the following is abstracted.

In considering the physical quality of thermit steel, the first question is, will not the strength of the welded part be only that of a similar cast steel part and not that of the original forging? As a matter of fact, forgings that have been thermit welded and tested to destruction will just as often fail completely outside of the welded area as they will in the weld or in the metal adjacent to the weld.

Steel, as cast, differs from forged or worked steel not in its chemical composition but only physically. Commercial cast steel on solidifying throws to the grain boundaries many impurities, and these, forming part of the cementing medium between the grains, are weaker than the grains themselves so that fractures of cast steel are usually intergranular. Forging, rolling, or working of these grains distorts them, so that the strength of the piece is then that of the material itself and not of the weaker grain boundary.

Weld Metal Quite Different from Cast Steel

Thermit steels, instead of being a refinement of relatively impure materials, are the result of the reduction of pure iron oxide by pure aluminum, with the result that they, although cast, invariably fracture through the grains.

From a paper read at the annual fall meeting of the American Iron and Steel Institute, New York, Oct. 25.

AFTER being graduated from the Stevens Institute of Technology in 1906 with the degree of mechanical engineer, J. H. Deppeler was associated with the New York Central Railroad in the electrification of its New York terminal. In 1909 he became interested in acetylene welding and worked in the research and development of this until 1912, when he became associated with the Goldschmidt Thermit Co., now the Metal & Thermit Corporation, New York. He is now chief engineer and works manager of that company.

This question was thoroughly investigated during the war, when Lloyds' Register of Shipping was asked to approve the use of stern frames made by welding together several simple forgings. Cast steel frames had been approved, but this request was refused on the consideration that, if a customer was willing to pay the extra cost of a forged steel frame, it would not be right to furnish him a forged steel frame with cast steel welds, because this would be no stronger than a cheaper cast steel frame of similar design. This contention started a series of tests on 10 x 10 in. sections of forged steel approved by Lloyds, some of the welds being between sections with free ends and others between sections not free to move. The results of this test are available in detail to anyone who may desire them, and resulted in Lloyds' approval of the thermit welding of forged steel frames.

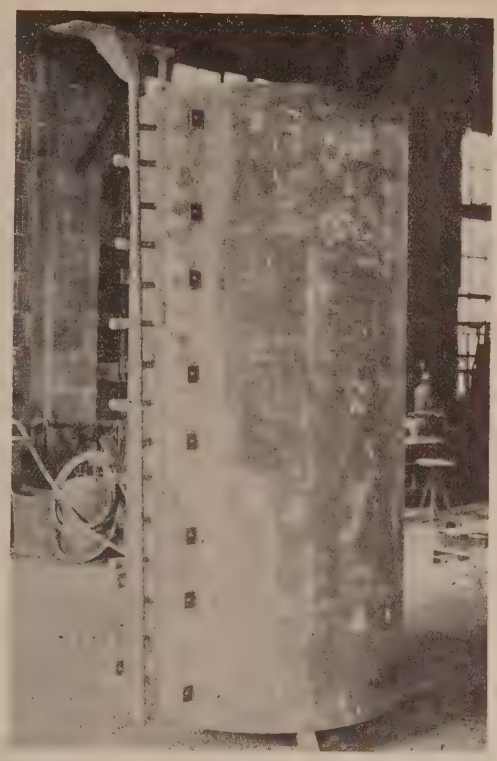
One impact test was quoted; where a 10 x 10 in. billet welded at the center and supported on 5-ft. centers was struck by a tup weighing 3290 lb. falling nine times from a height of 18 ft. This resulted in a permanent bend of 1¼ in. but no sign of fracture. The specimen was then turned over and straightened out by continuing the blows.

After this, Lloyds' engineer suggested that the weld be sectioned and examined internally rather than to continue the impact testing, which might be prolonged.

Since the approval of Lloyds' Register of Shipping and by the American Bureau of Shipping hundreds of stern frames of steamers have been thermit welded and, although in one or two cases these frames have again broken, the breaks have never been closer than 3 ft. from the weld. This, of course, is not a true test of the comparative strength of thermit steel and forged steels, because in the case of these ship welds the excess metal at the weld is usually not machined off; but it is indicative of the fact that the metal next to the weld is not harmed to any appreciable extent by re-crystallization or otherwise.

All the common alloying elements are easily reduced from their oxides by powdered aluminum, and these reductions have been carefully studied to determine the efficiency of the reactions. By properly mixing of the various thermits it is therefore possible to produce a steel of a given analysis. By such means, we have at our control the tensile strength, the ductility, and the hardness of the resulting steels. The tensile strength can be varied from about 50,000 lb. per sq. in. to 110,000 lb. per sq. in., and the corresponding ductility from over 40 per cent elongation in 2 in. down to zero.

Those familiar with the casting of ordinary steels must realize the difficulties we encounter at the extremely high temperatures so necessary for the welding operation. Thermit steels, however, have one very great advantage: they are perfectly deoxidized. In fact, all



LONG Seam in 2-in. Boiler Plate. Ordinarily such a long thin seam would be uneconomical because the volume of metal in the gates and risers is such a large proportion of the whole, but in heavy drums the advantage of simultaneously welding the entire seam and thus minimizing the internal thermal strains is obvious

of them show a very slight aluminum content. Here again, the steel man is suspicious, because an excess of aluminum to him usually means trouble, but the troubles that he has experienced are due more to entrapped particles of alumina rather than metallic aluminum alloyed with the iron. Even though, in the thermit reaction, great quantities of alumina are formed, the heavy metal is as liquid as water and separates from the lighter slag completely and almost instantaneously.

For these reasons, thermit steels do not have to be poured at low temperatures to cause them to solidify into dense, sound castings, and the presence or absence of defects in the steels will depend entirely upon the mold itself and the material from which it is made. To avoid contamination from the latter, it is necessary to select the best silica sands and clays and make a synthetic molding material containing a minimum of clay so thoroughly mulled with the sand grains as to coat each grain with the thinnest possible layer of clay. Such a molding material not only generates much less gas when the thermit steel comes in contact with it, but also remains so porous that the little gas generated easily passes out through the walls of the mold and not through the liquid steel. Loose grains of sand trapped in the superheated steel will completely volatilize.

The elimination of defects was aided by a condition inherent in thermit welding, that is, that the weld solidifies from the inside toward the outside; this, of course, tends to promote density and soundness in the weld itself. Before this fact was thoroughly realized, it was customary to use large risers, which were not only wasteful but actually harmful. It must be obvious why this shrinkage is so different from that in ordinary foundry practice; in the foundry, the heat from the molten steel passes out slowly through the mold, and solidification of the casting occurs first on the surface in contact with the mold and progresses toward the core of the casting, whereas in the welding operation the parts being welded act as enormous chills in the casting and extract the heat of the molten steel more rapidly from the center or core than from any other point. Freezing, therefore, occurs first approximately along the axis of the parts. The realization of this fact introduced a radical change in the design of welds, which fortunately at the same time greatly lowered the cost of the welding operation. This decrease in cost in turn has increased the applications of welding until now it is more economical to weld almost anything in the steel mill than to substitute a new part.

Four Precautions Necessary in Practice

Describing his experiences with thermit welding for steel mill repairs, L. F. Coffin, mechanical engineer, Bethlehem Steel Corporation, Sparrows Point, Md., noted four vital factors for success, viz., the set up, mold ramming, preheating, and release of the parts after welding. Since many repairs are not simple butt welds, but occur in irregular sections partially or wholly fixed by surrounding metal, the design of proper clamps and the provision of proper movement consistent with changing temperature are most important. Each repair merits close study of its individual peculiarities. Sometimes the supports or clamps may be mounted on rollers; at other times the parts must be initially jacked apart, and the jacks gradually released on cooling. Thermit welding of hollow cylinders also requires the best molder's skill to make a satisfactory core. For this and other reasons, Mr. Coffin prefers to do the thermit welding in the steel foundry. Lack of adequate preheating spoils more welds than any other cause. The joint should be uniformly and deeply heated to a high temperature with a reducing flame. Cooling after welding should be under control. In most cases a full annealing will be justified to reduce internal thermal strains. Annealing also increases machineability, although the speaker advocated leaving all excess metal in place as an extra factor of safety, wherever clearances would permit.

David Arnott, chief surveyor, American Bureau of

COMPARISON of the Amounts of Thermit Used in the Old and in the New Practice. This reduction greatly lowered the cost of the welding operation, but the reason for it was primarily the improvement of the internal quality of the weld

Shipping, New York, defended the marine authorities for being so cautious in approving new methods of construction or repair. A failure at sea is much more fraught with danger of great monetary and human loss than one on shore. Tests made 10 years ago and cited by Mr. Deppeler are unable to explain certain recent failures. For instance, if a stern frame breaks and is repaired, why should it fail again? In one instance a new forging replaced a part which broke away and was lost; the second fracture occurred in this new metal. In his opinion, the paramount consideration is the procedure in making the weld; there should be complete freedom for the parts to move during the temperature changes so as to reduce internal strains to the minimum. Control of such residual contraction stresses is, in Mr. Arnott's opinion, the most important problem now before those who are repairing ship frames and other massive parts by thermit welding.

Improper design of the part is sometimes responsible for original fracture, in the opinion of J. W. Owens, welding supervisor, Newport News Shipbuilding & Dry Dock Co., Newport News, Va. In such cases a second fracture may be expected, since obviously a repair by welding does not cure the fundamental defect. He had found one fracture of a stern frame immediately alongside a weld, but ascribed this to a concentration of stress caused by a heavy collar of weld metal around a relatively small cross section.

Small Shops Need a Superintendent

This Official Would Relieve Pressure on Manager and Foreman and Increase Production Efficiency

BY ARTHUR MUMPER*

THE general run of machine and die jobbing shops would gain much in efficiency if sound principles of industrial management were adopted. Too many of them are operated in a haphazard fashion. The business is transacted by an owner-manager, a shop foreman and a man in the office who is a combination bookkeeper, stenographer and time-keeper.

The owner-manager, of course, is the head of the company and usually does the work of three or four men. He makes all important 'phone calls, dictates answers to letters that require his attention, reads a large number of letters that are laid on his desk by a too-hurried office girl or man, quotes on a considerable amount of pending work, makes hurried business calls to various parts of the city by automobile, looks over requisitions for material and supplies, sees salesmen, goes out after new contracts and checks up on shop activities of the previous day and on work in process. Since the owner-manager in most cases is a former mechanic, he generally fills in his spare time by trying to help an over-burdened foreman.

So far as salaries go, the owner-manager of a jobbing shop employing an average of 30 men should rank fairly high, for he conducts a business amounting to about $125,000 annually. During an exceptionally good year, such as the shops in Cleveland enjoyed in the year ended last August, the annual business may go as high as $180,000. Thus, it would seem that the manager of such an establishment is too valuable a man to attend to any but strictly executive duties, leaving the lesser activities to someone else.

The foreman, on the other hand, is overburdened also. He must quote prices and deliveries on new work, make out material requisitions for various jobs, do considerable designing, plan the program for his 30 men, see that the material and blueprints are got together at the proper place and are so arranged that any one man or any number of men finishing a job at one time can turn to something else without delay; he must give his men individual attention as they need it, plan his work for the night turn, see that the men understand the blueprints thoroughly, take up with the inspector mistakes made in the shop and help decide what is to be done about them, and assume as many of the details as possible so as to relieve the manager. It is not surprising that, with these duties to look after, the foreman has no time for reflection or for studying his plant with an eye to improvements.

There should be provision for an assistant foreman, but the management seldom wants to pay enough for this job to make it attractive, in view of the great amount of detail involved. A good tool maker can earn about as much money on the bench without any responsibilities except those in connection with his own work.

To relieve the pressure upon the manager and the foreman there should be a superintendent, who ranks between the manager and the foreman. His duties should include quoting on prospective business, ordering materials, supervising the work of the designer in laying out his work, going over the shop inspector's reports and making decisions in regard to mistakes. He also should act as a buffer between the manager and the foreman, settle all matters that do not demand the manager's personal attention, interview all salesmen, see that no one gets in to the manager whose business he can handle, direct the activities of the office force, decide the precedence of orders in the shop and choose the materials to be used when they are not specified on the customer's blueprints.

If this plan were followed, the inspector would not be responsible to the foreman, but to the superintendent. However, he would work in close cooperation with the foreman. The designer, who would report to the superintendent, would do all drafting, thus relieving the manager and foreman of this job.

Many benefits would result from the operation of such a system. No longer being bothered with details that formerly required about 30 per cent of his time, the foreman could give efficient supervision to shop activities, a job that should be his first duty. Production would be increased, scrap losses would be reduced, savings would come from reclaiming waste matter and the mental and physical strain on the manager would be lessened. It is not an exaggeration to say that the superintendent, if he measured up to the proper standard, would earn his salary many times in increased efficiency throughout the entire personnel, from the manager down through the ranks.

*10,919 Glenview Avenue, Cleveland.

Solid Tests of Open-Hearth Slags

Condition and Composition of the Bath Judged by Color, Shape and Other Characteristics of Solid Slag

BY E. J. JANITZKY

IN the making of basic open-hearth steel, process control, as exercised by the practical furnace operator, is governed largely by his observation and interpretation of slag conditions. "Make the slag right and the steel will be right" is a widely prevalent slogan, and yet scientific studies of slags are to this day meager when compared with the knowledge gained through research on the behavior of the steel bath.

Such slag studies as have been published are concerned primarily with variations in chemical analysis. As applied to practical steel making these studies might be considered as "post mortem examinations" which are of little use in the treatment of a live subject, that is, while the heat is in the furnace. The present study has attempted therefore to correlate such indications of physical and chemical variables as are almost instantaneously discernible by the experienced practical melter, to be applied by him currently toward closer control of the steel melting process. Slag control, based upon observation of solidified basic open-hearth slag samples, is being practiced in many European works. Used in conjunction with metal tests for red shortness, this practice renders a service of distinct and practical value.

A preliminary study has been undertaken at the South Chicago plant of the Illinois Steel Co., and a general correlation made of the readily observed characteristics of similarly solidified basic open-hearth slag samples in respect to their chemical analysis, color, surface design, conformation and texture. No attempt has been made as yet in this preliminary study to connect the characteristics of the solidified slag samples under consideration with the inherent quality of the steel. The data obtained, however, reveal that for steel within similar carbon ranges and like conditions of charge there exists in present day practice a pronounced heterogeneity in chemical composition, color, surface design and texture of the slag.

Slag samples were taken with the ordinary melter's spoon, poured into shallow circular moulds 3 in. in diameter, ½-in. deep and cooled in air. The essential characteristics in the solidified slag cake thus formed are:

(1) Color of surface,
(2) Design on surface,
(3) Conformation of surface,
(4) Texture of cake.

Abstract of a paper before the annual fall meeting of the American Iron and Steel Institute, New York, Oct. 25.

BORN in Austria, E. J. Janitzky was graduated as metallurgical engineer from the Metallurgical Institute of Leoben, Austria. He has been successively in the employ of the Carnegie Steel Co., the Republic Iron & Steel Co., the Lackawanna Steel Co., the Jones & Laughlin Steel Co., the Minnesota Steel Co., and the South Works of the Illinois Steel Co., where he has been metallurgical engineer since 1915. He was the Henry Marion Howe medalist of the American Society for Steel Treating in 1922.

The surface of the slag samples were of a dull or lustrous black color (shade), as illustrated in Fig. 1, which shows both types, A being the dull surface and B the lustrous black.

In some cases, the slag surface contained a design or pattern which we speak of as spider-webbed, see Fig. 2. It should here be noted that the spider-web design varied from a very coarse to a fine web, as typified in Fig. 2B.

The conformation of the surface of the slag cake shows considerable variations which are classified as concave (note the sunken center of the slag cakes in Figs. 1 and 2), flat, convex or "puffed-up." All convex and "puffed-up" samples contain small gas holes, in the former case principally in the upper portion of the slag cake, in the latter, throughout the whole matrix; the flat and concave samples are very generally free of gas holes. A "puffed-up" slag is of course very gassy and represents a frothy condition of slag. Fig. 3 illustrates the "puffy" slag. The fractured slag cake is classified as dense or porous, in respect to gas holes, and as of columnar crystalline or stony structure. Fig. 4 illustrates the structural condition, A being a columnar crystalline and B a stony one. Both are dense. If piping is present, the shrinkage cavity is parallel to the base of the slag cake and is located approximately midway between the top and bottom surfaces. It is essential to have the slag free from metallic globules; cavities containing metallic inclusions (which have fallen out on fracturing the slag cake) are not to be interpreted as gas holes which would classify the sample as porous. Slags which contain large steel nuggets are useless, as by their reaction with the metal during solidification the appearance of the slag test is so changed that no interpretation is possible.

Data Analyzed

Twenty-five open-hearth heats were carefully observed and slag samples were taken, as herein described, just before deoxidizing or alloying additions were made to the bath. This moment should represent the nearest approach to equilibrium in the reactions between metal and slag of any period in the heat. The carbon content of the bath for the 25 heats studied at the time of taking the slag samples varied from 0.04 to 0.18 per cent. The present study has been confined to this (approximately) one grade of steel in order to simplify the interpretation of

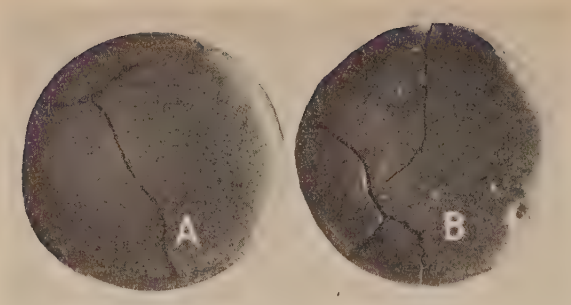


Fig. 1.—Dull (A) and Lustrous Black (B) Surface of Slag Cake

the results. All slag and metal analyses, together with the classification of slag characteristics as herein outlined, are given in Table 1.

To illustrate graphically the observed relations between the physical characteristics of the slag samples as noted and their chemical composition, triangular diagrams have been prepared of the type customarily employed in the charting of three-component systems. In this way, it has been possible to select at will from the various oxides comprised by these basic open-hearth slags, various groups of three and to plot the observed characteristics of the solidified slag cakes in relation to the variations of chemical composition for each of these groups. That temperature conditions may materially affect the visible characteristics of the solidified slag test is a possibility which it was necessary to neglect in this preliminary study.

The first choice of variables was the total acids (SiO_2 and P_2O_5), earthy bases (CaO and MgO) and iron oxides (FeO and Fe_2O_3). The composition of the 25 slags, as given in Table 1, was converted to give SiO_2, P_2O_5, CaO, MgO, FeO and Fe_2O_3 as 100 per cent. The converted values, as given in Table 2, were plotted on a triangular diagram, Fig. 6. It is immediately apparent that the dull slags, 1 to 8 inclusive, separate themselves from the lustrous black slags as shown by the line A_1-A_2.

Thus one of the physical characteristics listed in Table 1 has been associated with the composition of the slag. We can now definitely say that basic open-hearth slags in heats of 0.04 to 0.18 carbon containing less than 16 per cent. $SiO_2 + P_2O_5$ (on a converted basis of SiO_2, P_2O_5, CaO, MgO, FeO, Fe_2O_3 equaling 100 per cent) will have a dull surface when a solidified sample is taken, as earlier described.

A factor of importance in its bearing on the reactivity of the slag is the amount of excess base carried in solution in the molten mass over and above the quantities required for forming with the acids present those definite molecular combinations which have been identified as typical for the ground-mass in slags of the type here discussed ($2RO \cdot SiO_2$ and $4RO \cdot P_2O_5$).*

Calculated values of excess base for the 25 slags are given [in Table 3 in the paper] in terms of molecules of excess base. It seemed advisable to plot this variable against the silica and ferrous oxide content to determine a possibly different grouping of slag characteristics as related to variations in composition. After calculating the FeO and SiO_2 on a molecular basis, the excess base together with these were recalculated to a 100 per cent basis, and the 25 slags were then plotted.

Notable Conclusions Possible

Several notable conclusions are apparent from this chart [No. 7 in the paper]. The dull and lustrous black slags again group themselves as in Fig. 6. A low silica content in the slags is accompanied by a high excess base and an increase in the ferrous oxide content. We found that the lustrous black slags comprised those of comparatively low excess base and high silica content. Thus we may conclude that the lustrous black slags are associated with low FeO content. This phase will be brought up again in relation to a discussion of cleanliness.

Fig. 3.—"Puffed-Up" Slag Cake, Full of Blow Holes

Fig. 4.—Crystalline (A) and Stony (B) Structure of Slag Cake

In an attempt to correlate the composition with the surface design on the slag cakes termed "spider-web," the variables P_2O_5, SiO_2 and excess base, all from molecular analyses converted to 100 per cent of these three variables, were plotted. Here we find that these slags showing the spider-web design separate themselves from the balance of the slags. Thus a high P_2O_5 content seems to influence the appearance of the spider-webbed slag surface. It is important to find that the dull and the lustrous black slags are again easily separated, as are the columnar crystalline from the stony dull slags, showing that crystalline slags occur with low phosphoric acid content.

Thus are related all the observed physical characteristics of the solidified slag cake which seem to be related to the composition of the slag. It is understood that all

these groupings can be explained on the basis of the mineral composition of the different slags, but it has not been possible as yet to broaden the present work so as to include a study of mineral variations.

It is apparent that any practical application of slag samples entails relating the conclusions drawn from the slag study to the properties of the steel. One such steel property may be mentioned briefly, the matter of cleanliness. It seems apparent that low FeO in the steel will be conducive to a cleaner final steel. Thus a low FeO content of the slag is a desirable feature and the furnace operator can control his heat better by aiming to obtain a lustrous black slag surface on a test cake.

It is also probable that those slags which show the most dense structure in respect to gas cavities usually represent a condition of diminished gaseous reaction between metal and slag. It is not, however, inferred that in all cases this dense condition can be used for the determination of complete equilibrium between metal and slag, but it is believed that this density which is always accompanied by concavity be taken as an index of diminishing reactivity. For example, it is well known that the addition of iron ore to a molten steel bath results in a notable increase in reactivity which subsequently decreases and it is of interest to note that the solidified slag samples taken at intervals subsequent to ore addition exhibit

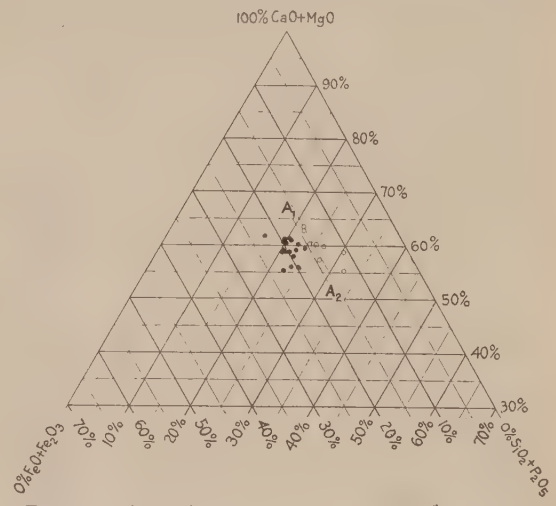

Fig. 6.—Relationship of surface coloration of slag cake to the three variables, acids ($SiO_2+P_2O_5$), earthy bases ($CaO+MgO$) and iron oxides ($FeO+Fe_2O_3$) plotted as chemical percentages. Note separation of dull from lustrous black slags. Data given in Table 2

diminishing degrees of convexity and porosity and if no further ore additions are made they become relatively dense and concave. Thus these slag tests may be employed practically and usefully as indicating the degree of

approach toward equilibrium conditions. In other words, by taking slags during the period after the charge is melted one can gather a frozen evidence of the magma in different stages during the process. From the foregoing reasoning one may conclude that slags which show a black lustrous and concave surface are the most desirable.

It should be emphasized that the desirable slag characteristics and composition must be determined for each plant, as local variations in the analysis of the charge and fluxes used will undoubtedly affect the coloration, surface design and texture of the slag tests. Undoubtedly a viscosity test as proposed by Herty and Gaines, which is handy and may also be executed at the furnace platform, would be useful in combination with the slag solidification test.

Petrological studies will still further enhance the knowledge and define more clearly the variation in the texture of the slag specimens. It is apparent that useful information can be obtained by the study of slags in solidified form and that much work is still required in this direction. The foregoing notes are derived essentially from the observation of solidified slag tests, and it is hoped that they may be found useful in actual furnace operation and also promote thought along the lines on which this paper has been written.

Some Exceptions Taken to the Author's Calculations

Mr. Janitzky has presented a very interesting paper on a most interesting subject, basic open-hearth slags, in the opinion of Dr. C. H. Herty, Jr., Bureau of Mines, Pittsburgh. The method of studying slags is much more comprehensive than is usually attempted by the average operator and should, with some additional information, be of great help to the open-hearth operator.

One common method of judging open-hearth slags, not mentioned in the paper, is to chill the slag on the spoon and examine the color of this solidified slag. If this solidified slag is crushed and the color noted, it is possible to predict the phosphorus content of the metal very closely, provided that the phosphorus in the charge is not so high that an abnormally high percentage of P_2O_5 is present in the slag. Deep chocolate browns indicate under 0.010 per cent, phosphorus, browns and light browns indicate 0.010 to 0.015 per cent, and black slags indicate above 0.020 per cent. Many a heat of steel has been tapped out by slag color in contradiction to preliminary results from the floor laboratory.

In treating certain parts of the slag composition as ternary systems and charting on ternary diagrams, Mr. Janitzky has brought out several interesting facts. However, it is safe to assume that the originators of the ternary diagram are groaning in their graves at the method of preparing Fig. 10 [in the original paper]. In preparing this plot the author multiplied the percentage of P_2O_5 in the slag by 10 and then divided the percentage of each component by the sum of SiO_2, P_2O_5 and excess base. To multiply one component of a ternary system by 10 before calculating the ternary composition is entirely incorrect, and had the author prepared this diagram by obtaining the ternary diagram with the molal percentages as calculated and then increased the percentage of P_2O_5 by some multiplying factor such as 10, drawing lines from the apex 100 per cent P_2O_5 to the point in question, he would have obtained a diagram showing the relations between the different types of slags more plainly than shown on Fig. 10, and, furthermore, he would have been correct mathematically. In this particular case no large error was involved, but had the percentage of P_2O_5 averaged 4 per cent, instead of about 2 per cent, very serious errors would have been made in plotting.

It is to be regretted that the author did not include more ideas on the effects of different types of slags, as shown by his tests, on the quality of the steel produced. Furthermore, it is somewhat dangerous to group 0.04 per cent with 0.15 per cent carbon heats as a single type of steel, as the rate of carbon elimination was undoubtedly entirely different in heats caught at 0.15 carbon and in those at 0.04 per cent carbon.

It is to be hoped that Mr. Janitzky will later present papers on the correlation of the slag tests with the quality of the steel produced, as this would be most interesting to every open-hearth man.

German Tests of Acids During Pickling

ARGUMENTS as to the relative merits of HCl and H_2SO_4 for picking steel are summarized by Dr. Fritz Eisenkolb in *Stahl und Eisen*. Hydrochloric acid etches more rapidly and more cleanly, operates effectively at a lower temperature and leaves a residue which does not react with ammonium chloride or zinc chloride. Disadvantages are the necessity for special containers (pottery or glass), low content of acid per unit weight, and the harmful vapors coming from the bath. Furthermore, the ferric chloride formed increases the action on the steel. It should also be pointed out that the waste liquors are useless and their annihilation is therefore a matter of considerable expense.

In the case of sulphuric acid, favorable factors are its high degree of concentration, absence of noxious fumes, and the retardation of attack by formation of sulphate of iron. Baths may thus be used nearly to the saturation point. On the other hand, the bath must be heated to give sufficiently rapid action. The cleansing action is not so marked due to the lower solubility of oxides than in HCl. Baths which have been long in use tend to deposit sulphate crystals when cooled down, and these must be removed by washing.

Most harmful of impurities in acid baths is arsenic. Acids rapidly lose their strength in the presence of arsenic and the steel is covered with an arsenical deposit. The tolerance on arsenic is 0.01 per cent in 66 deg. Be H_2SO_4 and 0.005 per cent in 22 deg. Be HCl. A qualitative test can be made by diluting to 45 and 20 deg. Be respectively and adding a few cubic centimeters of a 30 per cent KI solution. The formation of a yellow colloidal precipitate indicates only traces of arsenic. A yellow flocculent precipitate indicates larger quantities and the sample should be analyzed.

Of greater importance in operation of pickling baths are periodical data on the temperature and acid strength. While thermometers serve adequately for temperature measurement, the determination of free acid in the presence of iron salts presents certain chemical difficulties.

A method now in use in Germany consists, in principle, of allowing a definite amount of the acid sample to react in a closed vessel with a weighed amount of potassium carbonate. The volume of CO_2 thus liberated is read off on a burette calibrated directly in per cent of free acid.

The taking of tests at 2-hr. intervals is recommended. It is also pointed out that the analysis of the waste liquor in this same way will frequently disclose the wastage of considerable amounts of useful acid.

Waste Prevention and Salvage

How the Steel Industry Can Save in Inventories—What It Costs to Carry Larger Stocks of Parts

BY FRANK PARRISH

CERTAIN railroads and other large users of iron and steel products report impressive salvage or reclamation savings (equivalent to waste prevention) from the disposal of scrap. Iron and steel scrap is not an incidental item in steel making. It is rather a necessary and very important raw material. Even assuming that a steel works could not itself use the scrap it produced, its volume would be such that it could not be regarded as anything other than regular product, to be disposed of as such.

In handling scrap, however, there is opportunity for prevention of expense that is unnecessary and consequently wasteful. Furnace plants must keep this expense to a minimum, as it is directly reflected in costs, but in detached or outlying operations not making ingots or castings, nor regularly handling heavy steel products, the handling of scrap does become somewhat incidental.

Industries represented by membership in this institute consume yearly a total of not less than 25,000,000 tons of scrap. Much of it has to be handled several times in its journeys from the pick-up points, by way of scrap yards, cars, etc., to the steel furnaces. Each ton of scrap entering into ingots or castings is probably handled, on the average, as much as three times. If an average saving of as much as 5c. a ton for each handling could be made, the aggregate annual saving would be nearly $4,000,000.

[Mr. Parrish told of a campaign conducted last year by the Carnegie Steel Co. in an effort to avoid waste along many lines.]

Among the common items of waste which could be mentioned are:

Leakage in pipe lines;

Extravagant use of lubricants, waste and other mill supplies, and failure to reclaim such materials when profitable to do so;

Unnecessary burning of lights, use of heat, or running of water;

Saving of fuel in cleaning furnaces;

Unnecessary use of power, by failing to turn off motors, or to use belt shifts;

Unnecessary delays to locomotives, trucks or other motive equipment;

Utilization of unused laboratory samples of fuel, etc.;

Unnecessary telephone or telegraph expense;

Waste of office supplies;

Use of discarded forms or the backs of old reports for scratch pads, rather than new paper;

Reclamation of broken or worn tools;

Salvage of containers, packing materials, etc.;

Elimination of useless reports or failure to combine into one report information required by several different officials or departments, thereby making one report do for all.

Among the suggestions either offered or developed during the campaign, and dealing with the somewhat larger operating processes more or less peculiar to the steel industry and its allied or affiliated raw material, transportation or service companies, might be mentioned the following:

Cutting down the thickness of hot saws used for a certain operation by $\frac{1}{8}$ in., whereby the production of saw chips was reduced 2000 tons annually;

Platform between two blowing engines, allowing one man to run both engines. Estimated saving $5,000 a year;

Reduction of labor required for taking and preparing samples of ore. Estimated savings $3,500 a year for one works only;

Certain changes in limestone rescreening plant, which would make a return of $8,250 yearly;

Installation of distant or secondary signals, connection of additional switches with interlocking plants and other practices leading to fewer slow-ups and stops of heavy trains carrying ore. Annual saving difficult to estimate.

A perplexing salvage problem in the steel industry is the economical disposal of machinery or power plant units which have become obsolete for economical use where installed. In many cases such equipment could put in years of useful life at some other place, where its economical capacity would meet the requirements. But, for various reasons, it is often hard to get any dismantled piece of equipment released for transfer or outside sale. It is possible that the salvage return quickly available is not so high as that which was estimated when replacement was being considered, and the impulse may be to wait for a better prospect.

The superintendent or manager may feel that it is a good thing to have it around, but it is rarely put back into use at the plant which it formerly served. The result often is that it eventually becomes so far behind the times, or depreciates so much by reason of its idleness, that no one wants it. The longer it is held, the greater the ex-

THE first position of Frank Parrish was in 1893 at the American plant of the American Bridge Co. in Chicago. He was associated with this company in Chicago and at Pittsburgh until 1917, his last position being assistant purchasing agent. From 1917 to 1921 he was purchasing agent of the Canadian Steel Corporation, Ltd., Ojibway, Ontario. Since 1921 he has been supervisor of inventories, United States Steel Corporation, 71 Broadway, New York.

This article is an abstract of a paper read Oct. 25 before the American Iron and Steel Institute, at New York.

pense of holding it and, except in extremely few cases, the less it is worth.

Heavy Costs Involved in Inventory Expense

Cost of carrying doubtful materials in inventory, not counting market price changes, amounts to several times the bare cost of the money tied up. In the expense column such items as taxes, insurance, storage, extra handling and added accounting contribute to the burden, their total being practically as heavy as that represented by interest. In the depreciation column such pillagers as deterioration, obsolescence, shrinkage and uneconomical use take their heavy toll.

By 1925 these heavy carrying costs were getting considerable attention. In an address at Atlantic City, in June of that year, R. M. Hudson of the Department of Commerce said, in part:

> One good reason for this increasing attention to better stores control is the cost of carrying too many varieties. When it is found that the average cost of carrying or maintaining supply stocks is 25 per cent of their value, and that obsolescence accounts for nearly one-half of that cost, the only logical course open is the elimination of the slow-moving, the non-standard and the excessive varieties so largely responsible for the obsolescence.

The given division of this 25 per cent total was as follows:

Storage facilities	0.25 per cent
Insurance	0.25 per cent
Taxes	0.50 per cent
Transportation	0.50 per cent
Handling and distribution	2.50 per cent
Depreciation	5.00 per cent
Interest	6.00 per cent
Obsolescence	10.00 per cent
Total	25.00 per cent

For the use of our own organization a table was prepared similar to that below. It will be noted that this contemplates annually reduced net rates of expense and depreciation, which reduced rates are due to the declining asset values on which both are based. This point is not covered by the 25 per cent set of figures. The inference is that the same net rates continue year after year, and this is another reason why the rates of 10 per cent and 20 per cent, as used in the table, are considered extremely conservative.

Average Expense and Depreciation Costs in Carrying Undesirable Materials

Year	Expense Per Cent of Original Cost	Total Cost Per Cent (Original Cost Plus Accrued Expense)	Depreciation Per Cent of Original Cost	Asset Value Per Cent (Original Cost Less Accrued Depreciation)	Per Cent of Total Cost to Asset Value
First	10	110	20	80	137.5
Second	8	118	16	64	184.4
Third	6.4	124.4	12.8	51.2	243.0
Fourth	5.12	129.52	10.24	40.96	316.0
Fifth	4.1	133.62	8.2	32.76	410.0

Expense includes interest, insurance, taxes, storage, accounting, extra handling, etc.

Depreciation includes deterioration, obsolescence, shrinkage and any other factor which reduces value, impairs efficiency, or induces the illogical or uneconomical use of material.

Surplus, obsolete or discarded materials are undesirable materials; materials ordered for contingent use become undesirable materials in the majority of cases.

Depreciation stops when the scrap or salvage value is reached.

Expense continues to accrue so long as material is held.

The full cost of material cannot be determined until it has been used or liquidated.

Experience in liquidating undesirable materials will show the rates as given to be low rather than high. It will also show that many items are held longer than five years before being used or discarded.

It has been found that insistence on putting replacement parts in service at the first good opportunity and carrying the used parts in inventory at their lower value, rather than the new parts at cost, has induced much more careful analysis of the actual need for additional procurements.

Emergency Spares Often a Costly Luxury

It is believed that there has often been too high a value placed on the advantage of carrying a surplus quota of emergency spares. The person or department responsible for unit costs frequently seeks to avoid assuming the cost of this advantage, if possible.

Various factors, among them the development of welding and the trend toward heavier and improved equipment, suggest caution in procurement of emergency spares. Should a mining or quarry operation buy one or more steam shovels there would be no good reason for putting in emergency spares, in the expectation that the next steam shovel bought would be of exactly the same size and specifications. Should any particular part develop undue tendencies to break or wear out, it would be changed or strengthened to remedy the defect; and a spare part like the one proving defective would not again be used even were it on hand waiting.

Economists have divided the responsibility for industrial waste under recent conditions as follows:

Waste for which management is responsible, 67.3 per cent;

Waste for which labor is responsible, 17.1 per cent;

Total for which management and labor together are responsible, 84.4 per cent;

Waste due to external causes, 15.6 per cent.

Trend in Dirigible Design

Rear Admiral William A. Moffett recently predicted that the framework of airships of the future, like their predecessors, will consist of duralumin with steel wire bracing.

The girders will be of a new type, stronger and more efficient than hitherto used. The outside will be covered with the characteristic aluminized fabric, drawn smooth and tight. Buoyant helium will be contained in separate cells of gas-tight fabric. Engines will be inclosed in the hull, and the latter will be strong enough to resist storm or squall conditions approximately twice as severe as the Los Angeles can successfully encounter.

Improvements in airships along technical lines are, at present, "just around the corner." Specifically he mentioned larger and speedier airships of 10,000,000-cu. ft. displacement and 100-miles speed; oil burning engines; improved sheds and terminal facilities; better weather informational service; and, finally, the development of mechanical aids for handling airships.

Protecting Buried Steel Pipe

Buried steel pipe may be adequately protected from corrosion with asphalt and asphalt saturated fabric, in the opinion of A. Saunders, research engineer Lewis Asphalt Engineering Corporation, New York. He recommends two coatings of emulsified asphalt on the cleaned steel. Before the second coat is dry, the pipe should be wrapped spirally with fabric impregnated with pure bitumen, and then finished with two more coatings of emulsion, applied either with spray gun, brush or trowel. If the pipe must be handled after covering, the sticky surface can be dusted with talc or slate powder. This procedure will produce a covering of great durability and elasticity, capable of resisting rough handling and impact of earth and small rocks when the trench is filled.

CARNEGIE LIBRARY OF ATLANTA

BOOK REVIEWS

Mergers, Modified by Competition and Law

Mergers in Industry. 205 pages, 6 x 9¼ in., illustrated. National Industrial Conference Board, Inc., New York. Price $3.

Mergers and the Law. 153 pages, 6 x 9¼ in. National Industrial Conference Board, Inc., New York. Price $3.

Combinations and mergers in manufacturing industry commenced about 30 years ago. The movement has gained rapidly in the years since the European war. A comprehensive compilation of data and study of the results of mergers has been brought together in these two books. The mergers discussed are those of large scale production units, combined into enterprises of nation-wide scope; public utility and bank combinations are not considered.

The merger movement is due to two causes: the increase in transportation facilities for industrial products, and the development of electric power transmission and individual motor drives, which made possible the construction of indefinitely large factories. These two developments were accompanied by the development of corporate enterprise, and this in turn was supported by a widening public interest and market for corporate securities.

Tables of stock prices, earnings and other important data have been compiled for many large combinations. The conclusions drawn from analysis of these tables are that whereas the earlier mergers or "trusts" were projected in the expectation of making large profits, the prewar mergers did not generally show larger earnings than the individual concerns had previously produced. While there were a few exceptions, many of the earlier mergers failed and were dissolved. The conclusion sponsored by the Advisory Committee of Thirteen on the anti-trust laws and their enforcement, which is the authority for publication, is that industrial consolidations in general have not provided a safe, easy and sure way to business success. They have achieved some superiority in productive efficiency; they have actually repressed to some extent the tendency to rising prices, as compared with prices in industries which are not consolidated; and they have steadied the markets and the tendency to seasonal variations in the price of products.

Their principal advantage to the nation has been in lower prices and steadier employment, which they have been able to attain; but this was forced principally by the constant pressure from small and vigorous trade rivals outside the combinations. No merger has ever completely dominated an industry to the extent of crushing out the smaller concerns.

The second volume gives a brief summary of all the important and typical cases which have been brought against combinations under the Sherman and Clayton laws. It was early decided by the United States Supreme Court that the Sherman law merely defined the economic evils which it was intended to prevent, namely arbitrary price manipulation, and restriction of opportunity of producers in the choice and conduct of their business. It was left to the courts to define the particular practices which might bring about these economic evils.

The rule of reason was early introduced by the Supreme Court, and the cases were decided with respect to the intent evidenced by the combination, including the intents previously evidenced by the members and managers of the combine. Decisions adverse to combinations were rendered where the intent was to exclude others from the trade and oppress the public; and where such intent was not in evidence, the consolidations were allowed to proceed. On these grounds 436 suits were instituted under anti-trust laws between 1890 and 1927. Sixty per cent of these were by private individuals or corporations claiming oppression by consolidations, and 40 per cent were brought by the Government against combinations, but half of these were against labor organizations which by concerted effort were attempting to interfere with interstate trade. That is, about 75 per cent of all the suits were brought for individual liberty, thus proving the necessity of the anti-trust laws.

Mergers in general are not unlawful unless they evidence an intent to acquire a monopoly and to keep down competition from those outside of the consolidation.

The two books are critical rather than constructive. They are manifestly not intended to give advice and instruction in the formation of successful mergers, but merely to record the history of mergers in the United States, the results of the important mergers, and the legal restrictions which have thus far been defined by the courts under the anti-trust laws.

STERLING H. BUNNELL.

Student Guide to Micrography

Photomicrographs of Iron and Steel. By Everett L. Reed. 253 pages, 6 x 9¼ in., 218 figures, consisting of photomicrographs; seven appendices. John Wiley & Sons, Inc., New York. Price $4.

The main value of this book is to students of metallography interested in microscopic work. It opens with a graceful and characteristic introduction by Professor Sauveur giving a brief review of micrographic work in this country. The body of the book consists of reproductions of photomicrographs. There are 218 of these reproductions, divided into 18 main groups, starting with pure iron, commercially pure iron, wrought iron, cast steel, rolled steels, various heat-treated steels, alloy steels and various kinds of cast iron.

In general the photographs are good; some are exceedingly beautiful and reflect great credit on Mr. Reed's skill and care, both in preparation of the specimens and in the photography. In some respects the structures are not described with enough detail. Since this is a book for students, the structures that are not simple and fairly obvious should have had a little more description. The author is in a position to carry this out and should do it in succeeding editions.

A few suggestions may be made. Fig. 7 on page 7 with 0.62 per cent sulphur hardly comes under the class of commercially pure iron. Fig. 45 on page 31 of high-carbon cast steel may show lamellar pearlite on high magnification but looks more like sorbitic pearlite as given. The micrographs of hot-rolled steel should state whether they are transverse or longitudinal sections; some are transverse but the banded structures are probably longitudinal. The hardened hot-rolled steels on page 63 should be described more fully, and Fig. 93 of a 0.35 per cent carbon hardened and drawn steel would seem to show ferrite as well as sorbite. Also Fig. 117 on page 90 looks more like martensite than austenite. Fig. 129 on page 103 looks rather strange for a 0.50 per cent carbon steel slowly cooled in the furnace; there is little ferrite and the ground mass is sorbitic pearlite—probably the

steel is quite high in manganese. The semi-steels on page 207 are not so clear or good as most of the other photographs, and it is hard to distinguish the steadite mentioned.

The last 38 pages of the book consist of appendices covering the preparation of microscopic specimens, definitions of terms, identification of non-metallic inclusions, developing of films and plates, and printing of photographs. They add greatly to the value of the book.

G. B. WATERHOUSE.

How Surface Damage Affects Fatigue

Der Einfluss von Oberflächenbeschädigungen auf die Biegungsschwingungsfestigkeit. By W. Zander. 65 pages, 6 x 9 in., illustrated. Published by NEM, Matthäikirchstrasse 10, Berlin, W. 10, Germany.

This publication records the results of an investigation made by the author under the direction of Professor Föppl, and is a distinct contribution to the study of the effect of surface defects on the fatigue strength of metals. Fatigue specimens were made of duralumin, low-carbon steel, oil-quenched chrome-nickel steel, and oil-quenched molybdenum-tungsten steel, and artificial defects then produced by needle-point scratches, files, lathe tools, grinding disks, diamond point scratches, razor blade cuts, friction saws, chisel marks, and indentations of round steel points under pressure.

Fatigue tests were then made on a rotating-beam type of machine, and the amount of damage done was estimated by the percentage of reduction of endurance limit for damaged specimens. Detailed methods of getting stress values for endurance limits at the section where the specimen fractured are given in the article.

A large amount of test data is presented, and many photographs of damaged surfaces and of fatigue cracks. The length and depth of the various scratches and cuts are carefully recorded, but no attempt has been made to record radius of curvature at the bottom of scratch or cut.

The reduction of fatigue strength by the various artificial surface injuries varied all the way from 15 to 73 per cent. The damage caused by indentation of steel points under pressure seemed to be very severe, and, in general, duralumin seemed to be somewhat less affected by defects than were the steels. These general results are not out of harmony with the results of other studies of the effect of surface defects on fatigue strength.

H. F. MOORE.

Human Side of the Railroad

The Story of the Baltimore & Ohio Railroad. By Edward Hungerford. Two illustrated volumes; Vol. I, 372 pages; Vol. II, 351 pages. G. P. Putnam's Sons Co., New York. Price $10.

This book is in reality a romantic chronicle of the human side of a great transportation system. A vivid portrayal of the first meeting, the chartering of the road, the ready response of the populace to subscribe funds, and the laying of the "cornerstone," places a picture of confidence and determination squarely before the reader. Doubt soon replaced confidence, as difficulties of construction, quarrels, animosity and depletion of funds caused the work to lag. But the pioneers were determined and won, rallying again the spirits of their supporters, and we see great parades, celebrations and rejoicing as the first unit was completed and service commenced.

From a novelty and a pleasure jaunt, this new creation became a thing of utility. It was destined to be a time and money saver, and have a powerful influence on the productivity and the expansion of the country.

The pioneers exerted remarkable ingenuity in their tasks of construction. Crude tools were available, but their resourcefulness conquered many a difficulty. The solidity of many bridges, fashioned by hand and not by formula, rugged character of the first rail roadbed, and the inventive spirit of mechanical minded men toward creation of steam power truly shows the thoroughness of these ambitious men. In power alone we see a steady stream of remarkable changes from the horse to the sailboat, the introduction of steam power, with its numerous queer creations, stimulation of improvement through trials and prizes, and the early culmination of success, exemplified in Peter Cooper's "Tom Thumb."

While these developments were proceeding, the little official family directing the property was brought face to face with the fierce struggle being waged by the interests backing canals and waterways. Factions in the Federal and State Governments fought to eliminate or hedge in the iron horse, as the very existence of the canal system was at stake. Needless to say, the iron horse was in the ascendency and practically superseded its rival in less than two decades. Guidance of the road from its inception was transferred frequently from one master to another as new energy and vision were necessary to accelerate progress and to cope with the delicate problems of finance and expansion and to thwart attempts of lobbyists to strangle this growing and valuable public servant.

There was rich commerce to be reached both west and south, and far-seeing prophets in the management were quickly discerning their opportunities. Through panics and trials, difficult financing problems, bickerings and injustice of State officials, and in the face of almost insurmountable natural obstacles to construction, they moved on steadily.

Improvements in power, equipment and operation kept a steady pace with expansion, and we witness a marked increase in efficiency, shortening of delivery time and travel, and reduction in rates and fares. This is ascribed in no small measure to the thoroughness and infinite care applied in directing the road and its operations. Every item was carefully scrutinized; the operating rules were models in outlining details for the movement of trains and the duties of employees.

It was a stroke of fortune that the destinies of the Baltimore & Ohio were placed in the hands of John W. Garrett in 1858 for the trying days and years ahead. He continued in power for a quarter of a century. The opening drama of the Civil War involved the road through John Brown's raid at Harper's Ferry. The energy of the road and its resourceful leader was of tremendous aid in the long struggle that ensued, even though the road bore the brunt of many disastrous conflicts and devastations. Reconstruction came as an aftermath of warfare, followed in sequence by hard times, poverty and difficulties of financing. But Garrett had the will and forcefulness to carry on, building up the property as he went, overseeing even the minutest details personally, combating the powerful interests of competing lines, expanding the facilities and reaching out toward rich goals of commerce, so that his name is indelibly carved in railroad annals as one of its greatest figures.

In the succeeding years strenuous efforts were made to carry on the tremendous work initiated by John W. Garrett. But his successors were not entirely equal to the task until a receivership was necessary to right the financial structure. While this was of short duration, a powerful rival gained control, and for years the Pennsylvania railroad was involved in the destinies of the road.

The quick recovery added confidence in the soundness of the plans and policies of the road, which proceeded with new impetus. Correction of line, improvements in

power, equipment and shop facilities, terminals for more rapidly expediting shipments, double-tracking, and expansion into territory controlled by rival interests, added greatly to the power and efficiency of the road. Several able presidents directed this work until finally Daniel Willard took command after the beginning of the new century and has been responsible for the tremendous improvements which have occurred in the past 18 years. Oddly enough, two men, John W. Garrett and Daniel Willard, directed the destinies of the road for a combined service of nearly half its existence.

Labor difficulties occurred at various times, but the loyalty of the vast army of employees always won. The most serious difficulty perhaps was that following the close of the World War. But good has developed from that, as frank discussion leads to better understanding, and mutual problems are adjusted by peaceful means.

The present Baltimore & Ohio, through the period of Mr. Willard's administration, is too well known and respected to need much comment. Its financial structure is sound, and the physical character of the property is of the highest order. By acquisition of numerous smaller roads and its own expansion, it now serves a population far beyond the highest dreams of its founders.

Mr. Hungerford's book is devoid of the usual drab details of railroad statistics, just sufficient being introduced to carry the imagination of the reader into the picture of the progress being made. The keynote of the book is the power of the human being in conceiving, building, expanding and directing the destinies of that all-important link in the transport of life and the products of commerce—the railroad. C. B. BRONSON.

Rolling Mill Encyclopedia

Handbuch des Eisenhüttenwesens Gruppe Walzwerkswesen. Edited by J. Puppe and G. Stauber. 777 pages, 7½ x 10½ in., with 946 illustrations. Verlag Stahleisen, Düsseldorf, Germany. Price 85 marks.

"Walzwerkswesen" is to be a collection of books on rolling mill engineering and rolling mill practice, the first volume of which has now been published. The plan and scope of the complete work on rolling mill practice and rolling mill engineering is monumental, if we may judge from the contents of the first volume, which consists of 12 sections dealing with steel rolling mills and their economic importance, with the history of rolling mills, with constitution and properties of steel, the constitution of non-ferrous metals, the testing of materials, with specifications and tolerances, with cost accounting in rolling mills, operating statistics of rolling mills, superintending and operating problems, with the nature of the rolling process, with the roll and its arrangement in the housing, and with the combinations of roll trains in their formation of rolling mills.

Many of the steel works statistics and the description of economic conditions are, quite naturally, of much greater interest to European engineers and mill superintendents than to those located in the United States. They will, however, be of value to those who make a study of the possibilities of exporting iron and steel to European countries.

In a similar manner the sections dealing with accounting will be of greater interest to European works managers than to American, unless it be for the purpose of comparing our methods with those used on the other side of the Atlantic.

The historical development of rolling mill practice is of universal interest, and so are the sections dealing with the constitution and properties of ferrous and non-ferrous metals. The last two sections, namely those dealing with the rolling process as such, with the rolls and their arrangement in the housing and with the combination of roll trains into rolling mills, are of the most importance.

The preface states that the beginnings of the book have their origin in the time before the World War, and that it was the latter that has kept the book from being published sooner, and which at times made its publication rather problematical. We are promised that the second volume will contain the rolling of ingots and slabs into blooms and billets and the rolling of heavy sections, such as beams, rails, ties, special beams, wire rods, wire, plate and sheets. The third volume is to contain special rolling mills and also mills for the production of tubes, the rolling of alloy steels, cold rolling, the rolling of non-ferrous metals, rolling mill engines and electric drives, also auxiliary equipment of rolling mills. The fourth volume is intended to contain conveying and finishing machinery, rolling mill furnaces, the power required by roll trains, the supporting and lubrication of rolls, making of rolls, roll turning and grinding, and an appendix on roll pass design.

The publishers as well as the editors are to be congratulated upon what has been accomplished.

W. TRINKS.

A 60-page booklet entitled "Ten Years of the Iron and Steel Industry in Independent Poland," has been printed in English by the Committee of the Polish Mining and Founding Industry for the National Exhibition at Warsaw. A rapid expansion of the steel industry since the war is graphically shown by tables and charts. Production is still less than the pre-war output of iron and steel in Poland, but with the exception of open-hearth steel. The number of employees has increased steadily since 1924; in 1928 the total reached 52,753. Figures on distribution of output show that Poland consumed about 90 per cent of the total production.

New Books Received

Seven Iron Men. By Paul de Kruif. 241 pages, 6 x 9 in., illustrated. Harcourt, Brace & Co., 383 Madison Avenue, New York. Price $3.

Trends in Foundry Production in the Philadelphia Area. By Anne Bezanson and Robert Gray. 77 pages, 6 x 9½ in., illustrated. University of Pennsylvania Press, 3438 Walnut Street, Philadelphia. Price $1.50.

Formulas and Tables for Engineers. Third edition. By C. A. Peirce, W. B. Carver and C. E. O'Rourke. 228 pages, 4¾ x 7¼ in., illustrated. McGraw-Hill Book Co., 370 Seventh Avenue, New York. Price $2.50.

Blueprint Reading. By Joseph Brahdy. 199 pages, 6 x 9¼ in., illustrated. McGraw-Hill Book Co., New York. Price $2.

The Soviet Union Looks Ahead—The Five-Year plan for Economic Construction. 275 pages, 5¼ x 7¾ in., illustrated. Horace Liveright, 61 West Forty-eighth Street, New York. Price $2.50.

Forty Years with General Electric. By John T. Broderick. 220 pages, 5¼ x 8 in., illustrated. Fort Orange Press, Albany, N. Y. Price $2.50.

Journal of the Institute of Metals. Vol. 41. 825 pages, 5½ x 8½ in., illustrated. The Institute of Metals, 36 Victoria Street, London, S.W.1., England. Price 31s. 6d.

Mineral Industry During 1928. Vol. 37. 802 pages, 6½ x 9½ in. McGraw-Hill Book Co., New York. Price $12.

Oxy-Acetylene Welder's Handbook. By M. S. Hendricks. 208 pages, 4½ x 6¾ in., illustrated. Acetylene Journal Publishing Co., Chicago. Price $3.

Carnegie Scholarship Memoirs. Vol. 18. 94 pages, 5½ x 8½ in., illustrated. The Iron and Steel Institute, 28 Victoria Street, London, S.W.1, England.

Journal of the Iron and Steel Institute. Vol. 119. 916 pages, 5½ x 8½ in., illustrated. The Iron and Steel Institute, London, S.W.1, England.

Steel Corporation Buys Coast Plants

Purchases Assets of Columbia Steel Corporation for Some $23,000,000 Par Value of Its Own Common Stock

THE United States Steel Corporation announced Oct. 31 the exercise of the option which it had held for the past several months on the properties of the Columbia Steel Corporation. The statement was as follows:

"For several years the United States Steel Corporation has had under consideration the location of manufacturing operation on the Pacific Coast, the better to serve its existing trade, as well as to prepare for the future growth of both domestic and foreign trade, by service from coast plants. It is economically logical that the corporation should establish itself in the Far West. Its nearest present manufacturing operations of any substantial character in the North are in Illinois, in the Chicago District, and at Gary, in the Indiana District; and in the South at Birmingham, Ala.

"The purchase of Columbia's properties has been determined upon by the United States Steel Corporation after an extended and exhaustive examination, inspection and study of the properties and their possibilities. The growing demands for steel of various kinds in Pacific Coast territory and the greater demands of customers for improved service make it desirable that the corporation have its own producing plants located there.

"This purchase of Columbia properties affords a nucleus from which it is confidently believed the productive capacity on the Coast can be expanded from time to time, both to the interests of consumers and the territory. The present annual steel ingot capacity of Columbia is 340,000 gross tons, which is converted into a relatively narrow range of finished products. This will increase the United States Steel Corporation's proportion of the total annual steel ingot production of the United States, based on 1928 output, from 39.02 to 39.52 per cent, an increase of one-half of one per cent.

"The properties are to be purchased at approximately $46,630,000 on Feb. 1, 1930, payment to be made wholly in common stock of the United States Steel Corporation."

From a supplementary statement made by Myron C. Taylor, chairman of the finance committee of the Steel Corporation, it would appear that the cost of the Columbia Steel purchase in terms of the par value of the common stock of the United States Steel Corporation will be somewhat in excess of $23,000,000. This statement came in answer to a question respecting a report from San Francisco that the Columbia stock was to be exchanged at 17 for United States Steel at 199.75, making an exchange ratio of 11.75 shares of Columbia for one share of United States Steel. Mr. Taylor replied:

"That is not quite accurate. Columbia's assets are sold for our stock, and in the liquidation of the Columbia company they may calculate a resulting price per share for their shares through the liquidation. But that is their matter and does not concern us at all, our purchase being of assets for stock. The price basis at which our stock is taken is approximately correct."

From the foregoing it will be seen that the $46,630,000, mentioned as approximately the purchase price, would represent $23,344,000 par value disbursed at 199.75.

The Properties Purchased

The properties of the Columbia Steel Corporation include a modern blast furnace near Provo, Utah, together with a by-product coke oven plant of 850 tons daily capacity; rolling mills at Pittsburg, Cal., and at Torrance (Los Angeles), making steel bars, sheets, wire, nails and tin plate, and steel castings at Pittsburg, Cal., and Portland, Ore., besides raw material properties, including coal, iron and limestone in Utah. The latest development of the Columbia Steel Corporation was the building of a tin plate plant at Pittsburg, of 40,000 tons annual capacity, which was put into operation on March 12, this year. It also increased its open-hearth capacity this year at that plant by the addition of two 65-ton furnaces. The Columbia corporation, owned jointly with the McWane Cast Iron Pipe Co., Birmingham, a cast iron pipe plant at Provo, Utah, of 20,000 tons annual capacity, operated as the Pacific States Cast Iron Pipe Co.

It is believed that an expansion in the tin plate plant is an early likelihood, seeing that the Pacific Coast consumes, largely in the food packing industries, 350,000 to 400,000 tons a year.

Pacific Coast Consumption

Consumption of the Pacific Coast States, including British Columbia in Canada, is now probably of the order of 2,500,000 net tons a year. In round numbers 400,000 tons comes from the Pacific Coast plants, leaving something over 2,000,000 tons to come from other sections of the country. It is estimated that the bar and rod tonnage is 450,000 tons, probably 60 per cent of local origin. Rail tonnage may be put at 200,000 gross tons. The next largest class of steel in point of consumption is tin plate, amounting to as much as 425,000 net tons, less than 10 per cent made on the coast. Structural steel may account for 225,000 tons, 20 per cent of coast manufacture; sheets for 175,000 tons, 30 per cent of coast manufacture; plates for 175,000 tons and pipe, including seamless tubes, 400,000 tons. Between 300,000 and 400,000 tons covers a miscellaneous classification.

Aircraft Symposium Planned By Testing Society

A symposium on aircraft materials is being planned for two sessions of the 1930 annual meeting of the American Society for Testing Materials. The committe on papers and publications has secured the cooperation of an advisory committee which will assume the responsibility for soliciting the papers and authors. This committee is made up of the following members:

H. C. Knerr, chairman, consulting metallurgical engineer, Philadelphia; E. P. Warner, editor, *Aviation*, McGraw-Hill Publishing Co., Inc., New York; Dr. G. W. Lewis, Washington, representing the National Advisory Committee for Aeronautics; Commander R. D. Weyerbacher, manager, Naval Aircraft Factory, U. S. Navy Yard, Philadelphia, representing the Bureau of Aeronautics, U. S. Navy; J. B. Johnson, chief material section, Air Corps, Wright Field, Dayton, Ohio, representing the Army Air Service; Major Clarence E. Young, chief, aeronautics branch, U. S. Department of Commerce, Washington, representing the Department of Commerce; H. L. Whittemore, chief, engineering mechanics section, VI-5; Dr. H. S. Rawdon, chief, metallurgical division, U. S. Bureau of Standards; Dr. Alexander Klemin, consulting engineer, school of aeronautics, New York University, representing the Guggenheim Foundation; Dr. J. S. Newell, representing the Massachusetts Institute of Technology; Harold Backus, materials engineer, Berliner-Joyce Co., Baltimore; Captain H. C. Richardson, director of engineering, Great Lakes Aircraft Corporation, Cleveland; T. P. Wright, engineer, Curtiss Aeroplane & Motor Corporation, Garden City, Long Island, N. Y., and R. R. Moore, metallurgist, Wright Aeronautical Corporation, Paterson, N. J., representing aircraft and engine manufacturers; R. S. Archer, director of research, Aluminum Co. of America, Cleveland, and Dr. J. A. Mathews, vice-president and metallurgist, Crucible Steel Co. of America, New York, representing materials manufacturers.

From 12 to 15 paper will be secured, each definitely limited in size so as to constitute a résumé and a summary of existing knowledge on the subject.

For Officers of Institute

The following candidates have been nominated to fill seven vacancies on the council of the American Institute of Weights and Measures, 33 Rector Street, New York, to serve until December, 1932: George M. Bond, specialist in precision measurement, Hartford, Conn.; E. F. DuBrul, general manager, National Machine Tool Builders' Association; J. B. Ennis, vice-president, American Locomotive Co.; A. R. Erskine, president, Studebaker Corporation; Otto H. Falk, president, Allis-Chalmers Mfg. Co.; Robert H. Irons, president, Central Iron & Steel Co., and Charles D. Rice, vice-president, Underwood Typewriter Co.

American Scrap Exports Gain Heavily

Shipments During Eight Months This Year Averaged 44,949 Tons Monthly Against 43,012 Tons in 1928—Shortages Abroad

BY LUTHER BECKER*

THE unprecedented shipment of iron and steel scrap by the United States to foreign markets during the past two and a half years has created an unusual interest among the domestic dealers of this country, indicated by numerous inquiries as to the economic reasons behind the sudden and phenomenal growth of this trade. The use of scrap iron and steel abroad has increased steadily during the past few years in the making of raw steel. In some instances furnaces are now being charged with as much as 60 per cent scrap and only 40 per cent pig iron. This trend has been particularly true in several of the European and Asiatic countries where there is a scarcity of domestic iron ore, notably such countries as Italy, Poland and Japan, and, to a lesser extent, Germany and Belgium. Due to this increased demand and the resultant relative scarcity of scrap, the prices of this commodity abroad have risen until it is now profitable to ship this material from the United States great distances to a market.

The accompanying table showing the principal countries to which scrap has been shipped during the past six years should prove an interesting study. The trade in scrap during the period since March, 1927—the beginning of this large movement—has been very erratic, increasing from a total of 15,416 gross tons shipped during that month to 30,124 tons shipped in September, 1927. Fluctuations during 1928 were even more pronounced, varying from a total of 70,538 tons shipped during the record month of August, 1928, to only 16,306 tons shipped in the following November. Shipments during the first eight months of the current year have averaged 44,949 tons monthly as compared to the 43,012 tons monthly average maintained during 1928, a slight increase despite the fact that there have been no unusual months during the current year such as August, 1928.

Canada's Imports Increasing

There have been several other contributing causes to our increased shipments of scrap during the past two years. Canada, the largest purchaser of this material from the United States, experienced great difficulty in effecting a readjustment of its steel industry following the war

Luther Becker, Chief of Iron and Steel Division, Bureau of Foreign and Domestic Commerce

but during the past two or three years conditions in its steel mills have improved and it has increased its purchases of scrap from the United States until during 1928 it took 178,528 tons of this commodity, more than four times the amount of its purchases in 1923 and almost six times those of 1925.

Japanese purchases of scrap from the United States have increased tremendously during this period, due almost entirely to the unsettled conditions prevailing in China. The iron ore resources of Japan are extremely small, as is also its domestic supply of scrap, making it almost entirely dependent upon foreign sources for supplies of raw materials. China, which has for many years been the chief supplier of Japanese imports of iron ore, has been suffering from civil wars during the past few years and the resulting disturbed conditions in that country have practically eliminated it as a source of Japan's imports. Upon finding itself cut off from its usual supply of raw materials, Japan turned to the United States for a large proportion of its scrap and has increased its purchases from this source from 8670 gross tons in 1923 to 160,427 tons in 1928 and 97,160 tons through the January-August period of the current year.

Shipments to European countries have also increased and have been greatly aided, first by the strike in the Swedish iron ore mines in 1927, and second, by restrictions placed upon the exportation of scrap by the governments of Sweden, France, Italy and Germany. Other contributing causes have been the increase in the Polish production of steel, the partial exhaustion of Spanish iron ore and the completion of the recovery of scrap from the battle fields of Europe.

Italy, our largest European purchaser of steel melting scrap, draws mainly for its iron ore supplies from the island of Elba, Greece and Russia, and to a lesser extent Spain, and because of the paucity of its domestic ore resources, supplements these with a considerable use of scrap purchased abroad. France has been, until the current year, Italy's chief source of supply for this commodity, but since the French Government has greatly restricted the export of scrap to Italy it has turned to other countries for these purchases, and as a result of which the United States has increased its participation until, during the first six months of 1929, it became the chief supplier of this market followed in order by Argentina, France, the United Kingdom and Egypt. The United States' trade with Italy in scrap during 1926 amounted to only 12,147 tons, which increased to 73,348 tons last year and 65,710 tons during the first eight months of 1929.

Poland is the second largest market for American scrap in Europe and while, unlike Italy, it has a fairly extensive domestic ore supply, its resources are not sufficient to meet the demand of the Polish steel industry, and is mainly of a low grade. All high-grade ore is imported, chiefly from south Russia and partly from Germany and Sweden. In order to supplement its ore supplies to an extent where they will be sufficient to meet the tremendously increased production of the steel industry—an increase which has risen from 70,000 metric tons of raw steel produced during 1920 to 1,436,901 metric tons produced during 1928—Poland has found it necessary to import large quantities of scrap material. Difficulties experienced in the amicable settlement of its trade agreement with Germany and the restrictions on the exportation of French and Swedish scrap have been largely responsible for the opening of this market to American scrap, our exports having increased to this country from 14,858 gross tons shipped in 1927, the first year we participated in this trade, to 63,274 tons

*An address delivered to the Institute of Scrap Iron and Steel in New York City, Oct. 24, by Luther Becker, chief of Iron and Steel Division, Department of Commerce.

in 1928 and 68,103 tons during the first eight months of 1929.

Trade with Germany Increasing

With the exception of Poland and Italy, the only other important market in Europe, at the present time, for American scrap is Germany. Our trade with this country last year was more than double that of 1927, while shipments during the first eight months of 1929 indicate that the current year will show a large increase over the shipments of 1928. China has always been a fair market for scrap material, most of her purchases, however, being of mild steel in the form of plate cuttings, old horse shoes, wire shorts, etc., which are more easily worked in her small shops and are used in the making of all kinds of forged tools and simple steel manufactures.

Import Trade in Scrap Steady

In contrast to our export trade in scrap, imports of this material into the United States have remained practically stationary since 1924, there having been 66,841 gross tons of this material brought into the United States that year as compared to 63,314 tons during 1928. Indications are that the current year will show a substantial gain over last year as receipts during the first eight months are slightly in excess of the total tonnage received during 1928. Canada, the largest supplier of scrap to the United States, usually takes from two-thirds to nine-tenths of this trade, while Cuba makes sporadic shipments of large quantities of scrap. The United Kingdom, the only other country which has participated to any great extent in the movement of scrap to this country, has fallen off in its shipments during the current year, our purchases from this source having amounted to only 636 tons during the January-August period as compared to total purchases of 8190 tons last year.

What Is Quality in Wrought Iron?

Committee A-2 on wrought iron, of the American Society for Testing Materials, of which H. W. Faus, engineer of tests of the New York Central lines, is chairman, and G. H. Woodroffe, manager of the boiler tube department of the Reading Iron Co., is secretary, is engaged in the study of what constitutes quality in wrought iron. The information gathered by the committee on this subject should be of importance to the entire wrought iron industry. The committee has also completed physical and chemical tests to determine the effect of phosphorus on the physical properties of staybolt iron. The results of these tests will appear in the annual report of the committee for 1930.

The committee is engaged in the preparation of a definition for wrought iron. With the adoption of this definition it is expected that the process clauses of the various A. S. T. M. specifications covering wrought iron products will be revised to include wrought iron made by any process so long as the other requirements of the specifications are complied with.

A revision is under consideration of the specifications for staybolt, engine bolt and extra-refined wrought iron bars and of the specifications for hollow rolled staybolt iron to consist of a change of the definition of "box pile," and an increase in the requirements for reduction in area in the latter specifications from 42 to 48 per cent.

Iron and Steel at Chicago Fair in 1933

One hundred years of development in the iron and steel industry is to be a feature of the Chicago World's Fair Century of Progress Celebration to be held in 1933. Recommendations to the science advisory committee of the National Research Council have been made by W. H. Eisenman, national secretary of the American Society for Steel Treating, a member of the committee. He is collaborating with other members in working out a basic plan for the Chicago fair authorities which will enable them to present to the public advances made in pure and applied science from 1833 to 1933. Dr. Frank B. Jewett, president of the Bell Telephone Laboratories, New York, is chairman.

Commenting on the part that iron and steel should play in the forthcoming exposition, Mr. Eisenman says: "Progress of the iron and steel industry during the last century provides some of the most remarkable developments since the first use of iron by man. Introduction of the Bessemer, open-hearth and electric methods for the manufacture of steel constitute epoch-making events during the century. Not less remarkable in the progress of the metal industry has been the development during the past 25 years of high-speed steel, stainless steel, corrosion-resisting and heat-resisting alloys, tungsten carbides, and their effective influence on industry in general."

During the past year and a half $5,444,137 in life insurance policies has been taken out by employees at Hawthorne (Ill.) works of the Western Electric Co. Altogether some 2500 persons have taken out policies under a plan which enables them to pay by weekly deductions from salaries.

Magnetic Tables to Handle Steel

Bars, Pipe and Other Sections Pulled Along by Magnetized Rollers—Omits Long Gear Shaft

A DEVELOPMENT now attracting considerable interest is the use of magnetic tables for handling steel. A magnetic table consists of idlers and a number of driven rollers whose traction is increased magnetically. When handled on tables of this type the material is drawn to the rollers, producing the same effect as pinch rolls but without any top roll to interfere with handling the steel or to mar it.

Tables with magnetic rollers can be used for handling steel in mill lengths in about all forms, either cold or after rolling, when the temperature has been reduced well below the critical point. A cooling bed for handling steel bars, which has a number of new features in design, and a shear approach table of the magnetic type were developed recently by Willis McKee, engineer and contractor, Terminal Tower Building, Cleveland.

Either the magnetic shear table or one of standard line-shaft construction can be used in connection with the hot bed. Applying the same principle, a table with magnetic rollers has just been installed by an Ohio mill for handling electrically welded pipe.

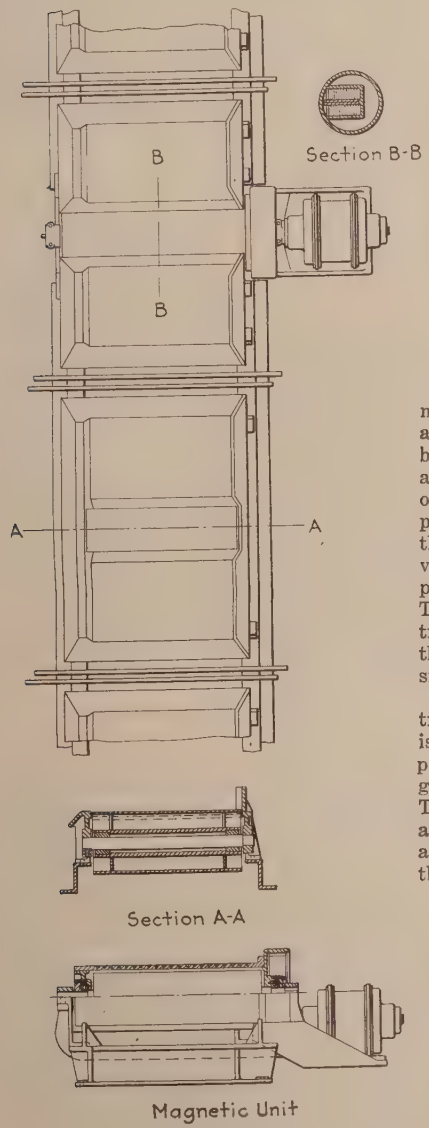
The runout is designed for the use of Schloemann Motor-Rollers, which units are totally inclosed. The shafts of the alternating-current motors are held against rotation and the rollers are mounted outside the rotor of the motor. The motors are mounted on two bars, which can be moved in opposite directions by a beam.

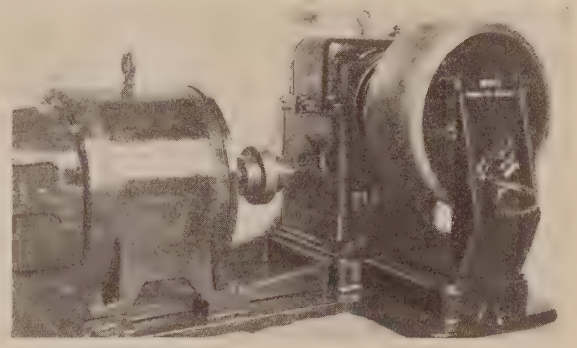
tendency for the bar to run off the rollers.

It is pointed out that, by discharging the material from the rollers by the skewing motion, there is eliminated the tendency to distort the bars which exists when kickoffs or lifting aprons are used. The material is delivered from the rollers to machined troughs which are so designed as to straighten the bars further when they are thrown against the sides of the troughs.

Balanced Hot Bed, Delivering to Either Side

On each side of the runout are two sets of notched machined supports, one set moving and the other fixed. On a line shaft under the bed are, at regular intervals, two sets of eccentrics, one of which controls the horizontal motion of the moving supports and the other, the vertical movement, through walking beams. With this design it is stated that any desired





MAGNETIC Roller for Table to Handle Welded Pipe (at Right)

Sections of the Magnetic-Roller Table, with Idler Intermediate Rollers

Above the central point of the motor rollers that form the runout is a guide, against which the bar is held by a slight skewing of the rollers, as the material runs down the runout. After the piece is in the proper position for discharge from the runout the angularity of the rollers is reversed, causing the discharge of the piece from the rollers on to the bed. This reversal draws against the central guide the next succeeding piece that is delivered on to the opposite side of the central guide.

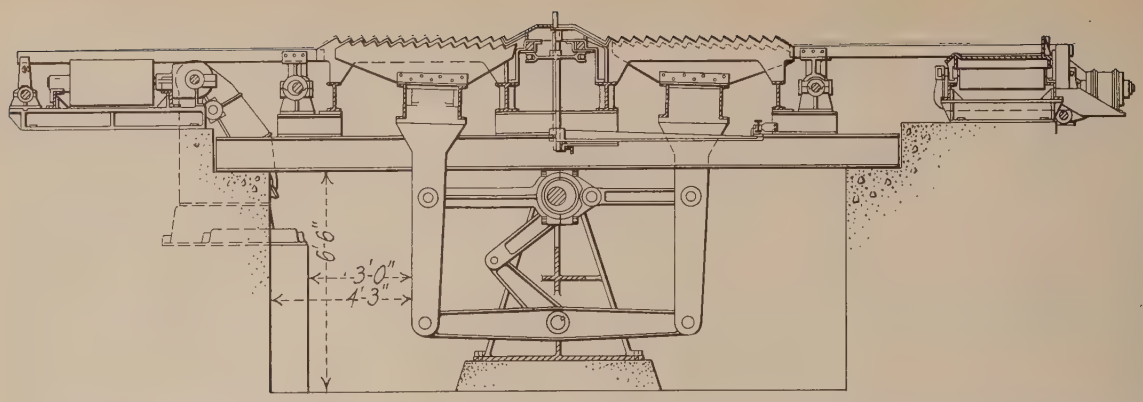
An advantage claimed for this central runout construction is that there is very little off-lead, the paths of the pieces on the two sides of the central guide being only a few inches apart. The use of the skewed rollers to cause a slight pressure of the material against the guide tends to straighten the bar and to eliminate any possible

elliptical motion can be imparted to the moving supports. These are in a normal position when the two sets of moving supports are at the same elevation of about 1 in. below that of the fixed supports.

Motion of the bed usually will be interlocked with a skewing of the rollers, so that the bed will advance the material on one side one notch automatically as soon as a bar is delivered into one of the troughs. When it is desired to advance the material the motor is started, either automatically or manually, and the shaft makes one-half revolution, then is automatically stopped. Each set of moving supports moves through one-half of the elliptical orbit and stops, one set moving below the fixed supports toward the central runout, while the other moves above the fixed supports and away from the runout.

Thus, as one side of the bed returns to a position from which it can pick up the bars, the pieces on the other side of the bed are being carried one notch farther from the runout. The bed can be designed so as to deposit the bars directly into the grooves of the fixed supports, or to one side, from where they will slide into the groove.

The magnetic shear table consists of magnetic rollers placed on 30 to 40-ft. centers, with idlers located as



Central Guide for Runout Shows at Center of Top, the Roller Immediately Beneath It Being of the Skewed Type. Table is arranged at left end with standard line-shaft drive. At right end is shown the alternate design, involving magnetic and idler rollers for the magnetic shear table

required between the live rollers. A cross-section of this table is shown at the right side of the bed in the sectional view, the table on the left being of standard line-shaft construction. The magnetic rollers have fixed magnets positioned within non-magnetic cylindrical shells.

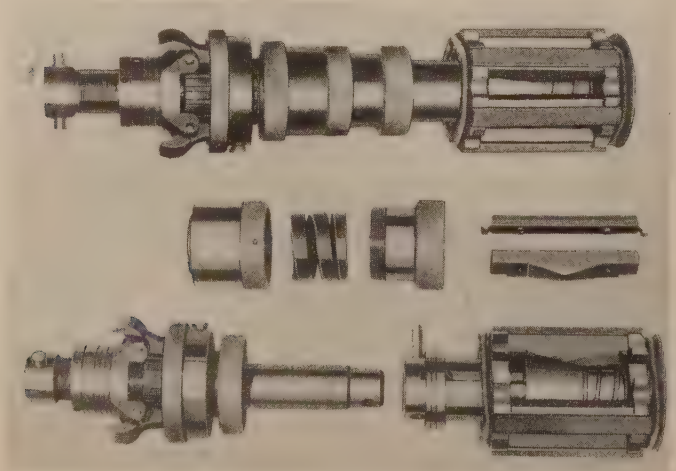
Cylinder Hone Arranged to Expand Automatically

HIGH production and close accuracy are claimed for the cylinder hone here illustrated, which has been put out by the Micromatic Hone Corporation, 5057 Woodward Avenue, Detroit. A feature is the automatic expanding head mechanism, which eliminates the hand expanding operation.

This tool is of single-cone type and has one central supporting point for the stone holders, which permits individual compensation for uneven wear. The cone is of a determined angle (beyond the angle of reversibility) which maintains positive expansion, assuring straight and round holes. The stones are mounted in light metal stampings.

A hardened and ground bushing mounted directly above the cylinder bore operates the expansion mechanism; it controls size and acts as a guide for the hone while entering and leaving the cylinder bore. Expanding fingers, when entering the bushing, expand the abrasive members automatically to a predetermined size. The abrasive members are then rotated and reciprocated in the cylinder bore for a given number of strokes, and when the operation is completed, a throw-out attachment on the machine raises the honing tools out of the cylinder automatically. As the expanding fingers leave the bushing the abrasive members automatically collapse, leaving the tools in position to enter the next bore. The compression spring cushions the pressure of the stones against the cylinder wall, eliminating stone breakage, and is caged to limit the expansion to a predetermined size.

For plants having comparatively small production, which is divided between bores of different sizes, a brake-type tool designated as the model B can be supplied. With this tool interchangeable hone bodies of various sizes are used with one brake head tool, investment being thus kept at a minimum. This hone may be used for either single or multiple operation, and the stones are interchangeable with those of the model A tool. The model B has a positive screw expansion with micrometer set and stop. The simple push-button adjustment can be regulated to an expansion of 0.0005 in., which assures accurate work and permits quick setting.



The Head Expanding Mechanism Eliminates the Hand Operation

Elkonite Tips for Etchograph Marking Pencils

ELKONITE marking points, which are said to eliminate the frequent dressing and replacement necessary with copper points and to permit clearer and deeper marking, are being offered by the William Brewster Co., 50 Church Street, New York, for use with its Etchograph electric marking machines. These points mark a sharp, deep line, and may be used on oily and greasy surfaces. Their life is said to be from 15 to 20 times that of the copper tips, the points being used in some cases for more than a month without resharpening.

The company has also brought out an "Etchograph Junior" machine which is the same as the larger equipment except that it has only two marking heats and is not intended for heavy work. Both machines may be used for marking iron, steel, stellite and tungsten carbide, the larger unit, with six heats, being adapted for marking a wide range of work, from light pieces, such as razor blades and feeler gages, up to heavy pieces, such as gears and shafts. This marking is done without any preparation, except connecting the machine to the lighting circuit. The machines are furnished for connection to a 110 or 220-volt 60-cycle single-phase a.c. circuit, but can be furnished for current of other frequencies. If 110 or 220 volts d.c. current only is available, a d.c. to a.c. rotary converter can be used.

New Horizontal Chucking Machine

Six-Spindle Unit May Be Set Up for Several Operations on One Piece or for Work Requiring Two Chuckings

FOR high-production chucking work up to 7 in. in diameter requiring a number of separate operations, such as turning, chamfering, forming, drilling, boring, reaming and threading, the Baird Machine Co., Bridgeport, Conn., has brought out the six-spindle horizontal chucking machine here pictured.

Simple tooling is a feature, and low maintenance cost is attributed to fully-inclosed flood-lubricated mechanism and Timken roller spindle bearings. In addition to a multiplicity of different operations on one piece, the machine is adapted for work requiring two chuckings, such as roughing and semi-finishing operations on gear blanks and other pieces. In this case the turret is indexed a distance of two spindles for each cycle.

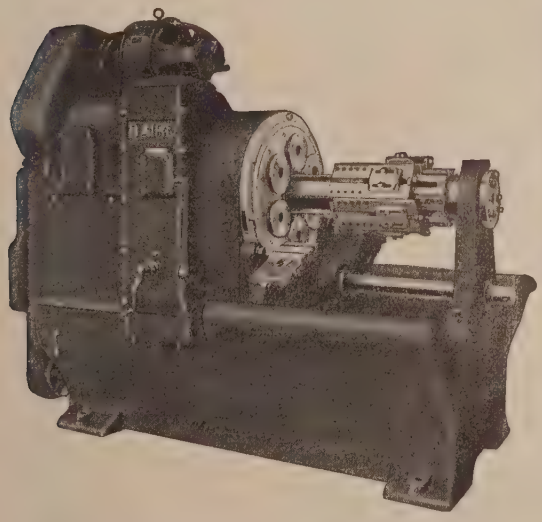
Parts and mechanisms common to all adaptations of the machine are the bed, containing the coolant and lubricating oil sumps and force feed pumps; the head, containing the turret; spindles and their clutches; the turret indexing mechanism and its driving spindle; the camshaft and cam drum, and the driving mechanism. Spindle and driving gears and the longitudinal feed cams are furnished to suit particular speed and feed requirements.

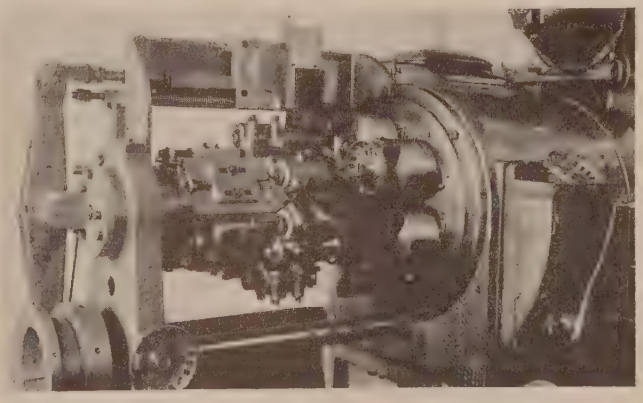
There are five longitudinal tool slides, three transverse or facing, and combination longitudinal and transverse tool slides. A large number of attachments, for drilling, angular or irregular turning, recessing, tapping, threading, drill speeding, etc., can be furnished. The chucks or work-holding fixtures may be either hand or mechanically operated, the latter being by means of a cam, lever and rod arrangement. A "work locator," operated by a foot treadle, has been designed for locating and holding the work until the chuck jaws take hold. Control levers, including cranks for turning the mechanism by hand, are provided at both front and rear of the machine.

With a pulley speed of 800 r.p.m., spindle speeds ranging from 19 to 800 r.p.m. are obtainable through a minimum number of change gears. The spindles may be run at varying speeds in relation to one another, and any spindle can be held stationary for cross drilling, longitudinal drilling of several holes, drilling off-center, or for milling. The driving spindles are in alinement with the work spindles when in the working position but are disengaged when indexing. A feature claimed for the driving mechanism is that it does not set up side strains on the work spindles or turret.

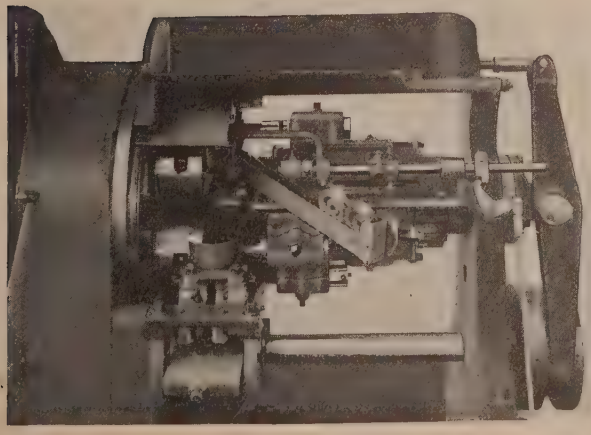
Turret indexing is smooth and is accomplished by means of an improved Geneva motion and 60-deg. movement of the camshaft. Indexing, as well as for tool return, is at high speed, and the rate of indexing remains the same regardless of spindle speeds or tool feeds. The turret is locked by means of a hardened steel bolt.

All tool-slides are adjustable and have a graduated dial for close setting. Two rates of feed are obtainable from the large cam drum at the head end of the machine, and a third rate of feed may be had by use of a reducing motion attachment, which is made up of a slotted lever and rod,

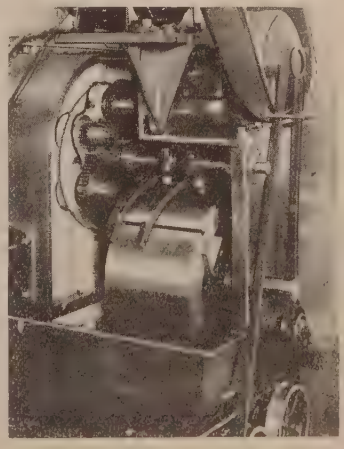




THE Machine Is Designed for High Production of a Wide Variety of Work. Several of the different types of tool-heads and tool-holders that can be used are shown in the close-up view above; the arrangement of the tool feed cam drum is shown at the right, below



SET-UP for Finishing Cast Iron Automobile Generator Pulleys Is Shown at Left. The extra length hub that permits chucking is cut off at the last operation, and a magazine catches the finished pulleys as they drop from the chuck. The front cross-slide is provided with a "generating motion," and a vertical cross-slide with form tool is employed. A work locator is also used



the latter having connection with the cam on the drum and the longitudinal slide in which the tools affected are carried.

Two of the three cross tool-slides are located below and one, a vertical slide, above the spindles. They are intended for turning and facing operations at the first, third and fifth working stations respectively. The lower slides are actuated by cams shaped to suit the particular job, and may be furnished with a "generating motion," by means of which roughing tools are advanced for angular facing of such surfaces as the vee in cast iron pulleys. The vertical cross tool-slide is mounted in a bracket that extends from the head of the machine to the tail support, and is operated by a rack and pinion. The rack receives its motion from a horizontal rod, lever and cam arrangement, the cam being mounted on the main camshaft outside of the tail support of the machine. The combination slides provide tool motion at right angles to the regular motion, and are used for making recess cuts inside of a hole, or facing the inside end of a piece. A combination slide arranged to permit using a reamer at the center of the work has also been devised. Holders and operating mechanisms can be furnished for self-opening dies or collapsible taps, as well as a backing-off mechanism for solid taps and dies.

The chip pan is large and has an overhanging lip under which a barrow or other conveyance may be placed to facilitate removal of chips. A dust hood for connection to an exhaust system can be provided. The initial drive may be by belt or motor, a 7½-hp. motor being recommended. Floor space occupied by the machine is 54 x 92 in. The net weight is approximately 12,000 lb.

Cold Saw Equipped with Oilgear Hydraulic Feed

FLEXIBILITY of feed range, rapid traverse in both directions, and simplification of feed drive are features of the Newton cold saw cutting-off machine with Oilgear hydraulic feed, brought out recently by the Consolidated Machine Tool Corporation of America, Rochester, N. Y. Ten sizes of the machine, with capacity for cutting rounds from 5¼ to 25¾ in. in diameter, and other sections in proportion, are built.

For the feed, a type QSA Oilgear feed and rapid traverse pump, driven by a separate motor through Texrope or silent chain at the rear of the machine, is employed. Oil under pressure is carried through piping to a cylinder bolted to the rear end of the base. The piston-rod of this unit is anchored in the spindle saddle in line with the saw blade, bringing the feed pressure in line with the cut. Any variation in feed from 0 to 23 in. per min. is readily obtainable, as well as quick traverse in both directions at the rate of 90 in. per min. The feed and rapid traverse lever is located conveniently at the front of the work table. Adjustable stops are provided for controlling the length of feed travel and the automatic quick return, making the machine semi-automatic in operation. With one movement of the single lever, the machine completes the cutting cycle, the saw carriage stopping at its original position.

In addition to flexible feed range, the hydraulic carriage drive provides even and smooth cutting; the oil, acting somewhat as a cushion, equalizes the feed pressure for cutting through hard spots. The condition of the saw blade may be checked, a dullness of the blade being shown by the building up of working pressure on the gage. The hydraulic feed also makes possible the elimination of feed shafts, gears, reversing clutches, feed worms and wheels, and their lubrication problems.

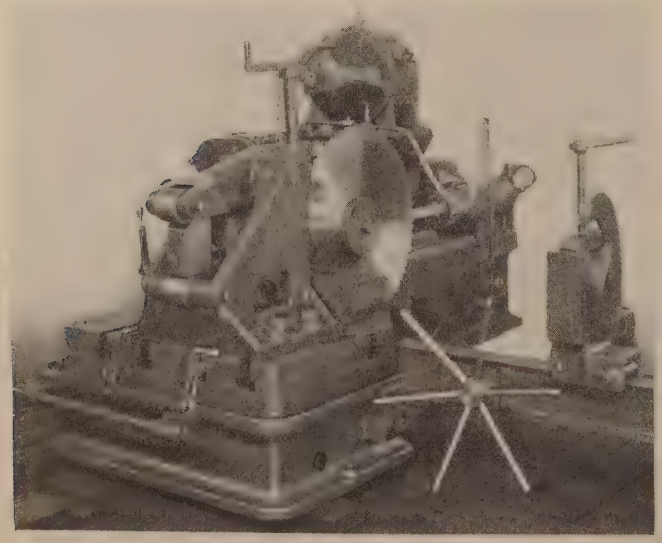
Another feature of the machine is that the saw blade cuts up, so that the thrust of the saw carriage is directly down on the base. This, together with the hydraulic feed, is stressed as markedly increasing the productive possibilities of the machine.

Direct-Connected Motor Drive

The spindle drive is by means of a direct-connected constant-speed or a variable-speed motor, which is mounted on top of a bracket directly on the spindle saddle, and pick-off gears. From this point the drive is through a hardened steel worm which meshes with a large phosphor bronze worm wheel on the pinion shaft, which has herringbone teeth cut from the solid. This pinion meshes with a large herringbone gear which is also integral with the spindle.

Except for the spindle, anti-friction bearings are used throughout the drive. All bearings on the machine are lubricated from a centralized oiling system, a Farval type lubricator supplying oil under pressure to each bearing. Extra equipment includes special holding chucks, air clamps or hydraulic clamps. The hydraulically operated clamp is piped to the Oilgear pump, making the machine entirely self-contained. Stock feed trolleys can be furnished so that bars 20 ft. or longer can be fed into the cutting position. These stock trolleys are hand adjustable by means of a pilot wheel either on the trolley saddle or located at the operator's position.

In demonstrating the machine at the recent Machine Tool Show, 9½-in. diameter S. A. E. 1040 steel bars were cut in 3½ min. Specifications for the largest and smallest machines respectively are: Diameter of saw blade, 20 in. and 90 in.; length of feed, 7⅞ in. and 48 in.; size of work table, 14 x 22¼ in. and 60 x 88 in.; and driving motor, 5 hp. and 50 hp.



HYDRAULIC Clamps Operated by the Oilgear Pump May Be Used. S.A.E. 1040 9½-in. steel bars are cut in 3½ min.

Open-Hearth Men Meet in Chicago

Practical Steel-Making Problems Taken Up In Two Days of Technical Sessions—Visit Laclede Steel Co.

PROGRAM for the autumn meeting of the open-hearth committee of the American Institute of Mining and Metallurgical Engineers, at the Hotel Stevens, Chicago, Nov. 5 and 6, follows. As has been the case for some years at these semi-annual meetings, no set papers were prepared. Instead, definite topics for open discussion were arranged for, covering four half-day sessions, and members were asked, in advance, to be prepared to talk on specified items.

For Tuesday morning, open-hearth mechanical equipment was the general topic. Pugh ladles vs. metal mixers, automatic couplers on stock buggies, automatic tongs for handling molds and ingots, best size of mold for large slab ingots to avoid excessive segregation in rimming steel, and furnace control equipment were the specific subjects.

Reports of standing committees had the floor at the beginning of the afternoon session; committees on combustion, furnace design, refractories, organization, quality control—rimming steel and killed steel separately—steel melting, pouring practice, combustion control and auxiliary equipment being on the schedule.

Fuels constituted the major topic of the Tuesday afternoon session, the discussion going into relative B.t.u. consumption of various fuels for each ton of ingots, methods of metering fuels, limiting factors in use of low-grade fuels and several items relating to control of melting and refining conditions.

Furnace design was considered on Wednesday morning. Specific topics included insulation of furnace bottoms and checker chambers, dampers, soaking pits, Venturi ports and inclined port roofs. Design of a standard furnace to burn a specified fuel most economically was the closing item for this session.

Operations and quality control were two general subjects scheduled for the last session. Drying ladles and stopper rods, checker removal on rebuilding furnaces, handling basic slag (in the pit), ladle trunnions and cables, nozzles and corrugated vs. plain-wall molds were listed under the first head. Quality control included report on last six-months progress, by Dr. C. H. Herty, Jr., United States Bureau of Mines. Other topics were use of silicon-spiegeleisen, of aluminum and of ferro-manganese, handling of slags in the furnace, soaking-pit heating and blooming mill work, rolling of high-sulphur steel and of sheet bar steel, and heavy, loose scale on ingots as drawn for rolling.

On Wednesday evening a joint session was scheduled at the Chicago Engineers Club with the Chicago branch of the American Institute of Mining and Metallurgical Engineers.

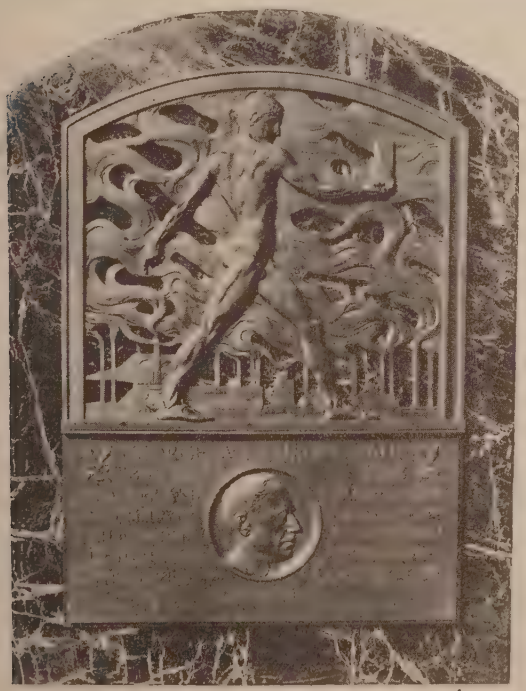
Thursday the members of the committee are to be guests of the Laclede Steel Co. at its works in Alton, Ill. Here the chief point of immediate interest is a new 100-ton open-hearth furnace built and operated on the Stevens principle. This unit is said to be averaging below 30 gal. of fuel oil to the ton of ingots, melting a cold-metal charge.

Newport News to Build Two Dollar Line Ships

WASHINGTON, Nov. 4.—Two 20-knot combination passenger cargo vessels of about 33,000 tons displacement each will be built for the Dollar Steamship Line by the Newport News Shipbuilding & Dry Dock Co., Newport News, Va. Contracts covering construction loans of $5,287,500 for each of these large vessels have been signed by Chairman T. V. O'Connor of the Shipping Board, Vice-President H. M. Lorber of the Dollar company and President Homer L. Ferguson of the shipbuilding company. The vessels are to be engaged in the round-the-world service and will be the largest and most modern in that service. The first is to be ready for service by Oct. 1, 1931, and the second is to be completed by Feb. 1, 1932.

Contracts covering the loans recently awarded the Motor Tank Corporation of Philadelphia, to be used in aid of constructing five 11-knot Diesel tankers of about 18,900 tons displacement each, also have been signed. The loans aggregate $6,304,687. The vessels will be built by the Sun Shipbuilding & Drydock Co., Chester, Pa.

Triumph Electric Corporation, Cincinnati, manufacturer of electric motors, has appointed Garrett Burgess, Inc., 5050 Joy Road, Detroit, as sales representatives in the Detroit district.



A BRONZE plaque in honor of the late George W. Niedringhaus, pioneer steel manufacturer in the St. Louis industrial district, was unveiled on October 25 in the rotunda of the new city hall in Granite City, Ill., which he founded. The plaque, 4 x 5 ft. in size, is mounted on marble. It shows at the top a figure of a young worker against a background of factories and smoke, and below is a relief profile of Mr. Niedringhaus, and the words: "George W. Niedringhaus, 1864-1928. Pioneer and great leader. An employer of many whose personality won the hearts of his fellow men. Whose vision and energy built a city."

The plaque was designed by Victor S. Holm, of the Washington University School of Fine Arts, St. Louis, and is the gift of a group of Granite City citizens. A similar tablet was installed in the Granite City National Bank last July and others are to be placed in the Young Men's Christian Association and St. Elizabeth's Hospital.

The address presenting the plaque to the city was made by L. Warrington Baldwin, president of the Missouri Pacific Railway. Mayor M. E. Kirkpatrick, whose first job was in the steel mills, accepted it. Philip Stremmel, superintendent of the Granite City Steel Co. and for 40 years an employee of Mr. Niedringhaus, acted as chairman. The tablet was unveiled by Mrs. Nathaniel B. Randolph, youngest sister of Mr. Niedringhaus.

High-Production Hobbing Machine

Simplified Gearing and Drives, Anti-Friction Bearings and Hob Spindle Drive Outside of Bed Are Features

FOR roughing and finishing spur gears, spline shafts and similar forms on a manufacturing basis the Barber-Colman Co., Rockford, Ill., has brought out a new hobbing machine, designated as the type B.

Features include simplified gearing and drives, extensive use of ball and roller bearings, including Timken roller bearings on the hob and work spindles; worm-gear final drive to the hob; a hob spindle drive outside of the bed, permitting the hob to be swiveled on a center under the work; and a work-spindle housing mounted fast to the base, the work diameter being controlled by an elevating bed. Also, a unit pressure oiling system; automatic continuous lubrication of the feed box; hob slide power rapid traverse; centralized interlocking controls; use of hardened spiral bevel gears throughout; screw and micrometer dial for positioning the hob, and direct-connected motor drive.

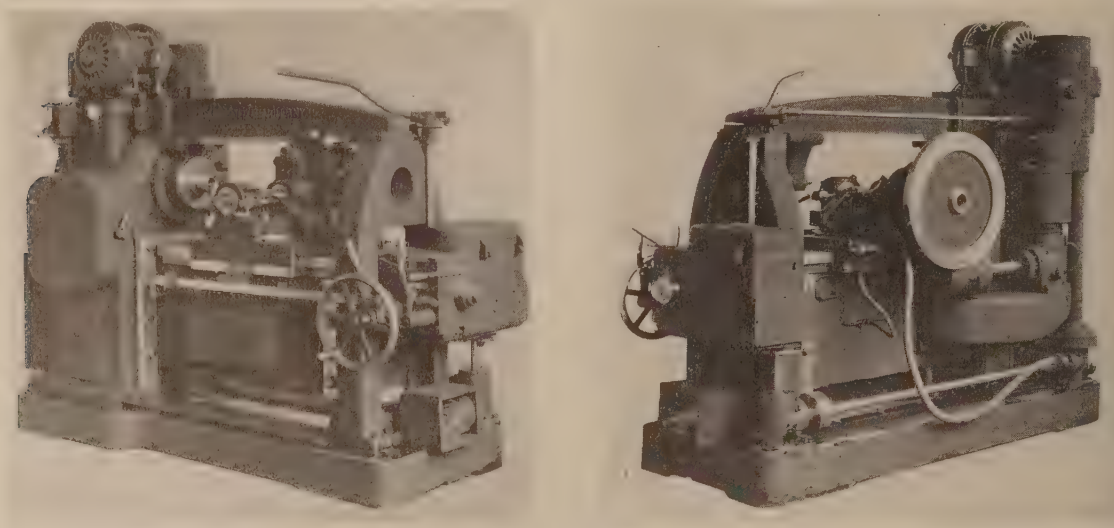
A departure from usual practice has been made in the framework and adjustment of the machine. At one end of the base casting, which serves also as an oil reservoir, is mounted the main upright which carries the driving and indexing elements, as well as the main work-spindle, as a complete unit. This upright is tied to the outer upright by a cast-iron overarm or bridge, as shown. The inner faces of both uprights are machined and form a parallel open-sided box in which the hob-carriage main bed is raised and lowered. This construction is intended to permit accurate adjustments for diameter of work and to provide unusual rigidity for production operations.

The front end of the standard work-spindle has a No. 12 B & S taper, but the hole through the spindle and the spindle face can be made to permit holding and driving a wide variety of work. The outer support for the work may be a center or a bushing sleeve, which is carried in an outer tail-center bracket that is adjustable along the overarm of the machine. Indexing of the work spindle is accomplished by a hardened steel worm and large diameter bronze-rimmed worm-gear.

The hob slide is accurately adjusted by means of a screw to position the hob endwise, and is then clamped in place. The drive to the hob-spindle is through worm gearing. It is desirable that the swivel for setting the proper angle of hob to work be approximately under the center of the hob, and this is accomplished by separating the worm-gear case and the bevel-gear case and joining them with a heavy swivel fit. With this arrangement, it is claimed that, regardless of the hob setting, the worm-gear case maintains its alinement with the hob spindle and the bevel-gear case with the man drive-shaft, the entire unit then being clamped to form a heavy hob swivel slide driven by a shaft outside of the bed ways.

Two elevating screws support the bed on which the hob carriage travels, and graduations are provided to permit adjusting the height of bed to 0.0005 in. The feed box is driven by an independent shaft that runs continuously. This shaft provides power through the feed change gears for any selected feed, or through the reversing gears for quick traverse of the hob slide in either direction, the feed and quick traverse movements being selective by a lever on the feed box. In addition to motor controls, an automatic stop on the machine operates a friction driving clutch located between the motor gears and the drive change-gears. All bevel gears are of spiral type.

Specifications include: Maximum and minimum center distance between work-spindle and hob, 8 in. and 2 in.; maximum travel of hob carriage, 16 in.; maximum diameter of hob, 4½ in.; feed, 0.081 to 10.72 in. per min.; range of the eight hob speeds, 55.1 to 159.4 r.p.m.; motor, 7½-hp., 1750 r.p.m.; and floor space occupied, 42 x 92½ in.



Work-Spindle Housing Is Mounted Fast to the Base, the Work Diameter Being Controlled by the Elevating Bed. The hob spindle drive is outside of the bed, but the hob may be swiveled on a center under the work

Data on "Battledeck Floors"

A technical bulletin describing the "battledeck floor" construction has just been issued by the American Institute of Steel Construction. This is a floor made of steel plates welded to I-beams. A few experimental floors of this type have been installed during the past year, and special automatic welders designed to handle the work. A demonstration of the proper method of construction will be staged at the convention of the institute at Biloxi, Miss., on Nov. 14. Complete engineering data on the floor is contained in the bulletin just issued.

Society Forms Division of Sales Engineers

A sales engineers' division of the Cleveland Engineering Society, Cleveland, has been organized with the following officers: Chairman, C. E. Hague, Dayton-Dowd Co.; vice-chairman, J. L. Finnicum, Allen-Bradley Co.; recorder, F. W. Kessler, Lincoln Electric Co.; member executive committee, G. L. Blomquist, Strom Ball Bearings Co. E. J. Lund was appointed to serve with the officers on the executive committee of the division.

This Issue in Brief

Stock market collapse will be followed by a period of hesitation and watchful waiting, machine tool industry expects. But the liquid and prosperous condition of industry is expected to act as a bulwark for a continuing satisfactory volume of business.—Page 1286.

* * *

Don't overburden the foreman with paper work or with anything else that takes much of his time away from his primary duty of supervising if you want low manufacturing costs. Allowing him time for efficient supervision will inevitably result in reduced scrap losses and greater shop economy in general.—Page 1234.

* * *

How many of the 13 major sources of waste are not receiving attention in your plant? A specialist in waste prevention lists these sources on Page 1239.

* * *

Merger movement is due in considerable measure to the development of electric power transmission, says National Industrial Conference Board. Individual motor drives have made possible the construction of infinitely larger factories. Another major factor is the increase in transportation facilities for industrial products.—Page 1241.

* * *

"Mental bondage to established custom" has so far prevented machine designers from taking full advantage of the technical freedom granted by electric power. The habit of restricting the application of power to one point of the machine is a heritage of older days.—Page 1230.

* * *

Even the small shop needs a superintendent. He can earn his salary many times over by relieving the owner of those duties which take his time away from company management problems. —Page 1234.

Strength of forgings repaired by thermit welding process is not limited to the strength of steel castings. Tests "to destruction" reveal that the fracture occurs as often completely outside the welded area as in the weld or adjacent to it.—Page 1232.

* * *

Better steel results from observation of physical characteristics of the slag specimens. Lustrous black slags are associated with low FeO content in basic open-hearth steels. Spider-webbed slag surface indicates high P_2O_5 content.—Page 1237.

* * *

For pickling, is hydrochloric superior to sulphuric acid? HCl etches more rapidly and more cleanly, but special containers are needed, and the vapors arising from the bath are harmful. —Page 1238.

* * *

Habit of saving replaced equipment for emergency use usually results in loss. Better get rid of the old equipment as quickly as you can. Experience shows that it is rarely put back into service in the plant in which it formerly served. It depreciates so much more in idleness that eventually no one wants it.—Page 1239.

* * *

Few machine designers are making use of the great flexibility of the electric motor. Power, ranging from 0.001 hp. to 10,000 hp. or higher, is available through a wide choice of speeds, without the intervention of mechanical means.—Page 1230.

* * *

You can predict very closely the phosphorous content of molten open-hearth steel by observing the color of a sample of solidified slag (crushed). Many a heat of steel has been tapped out by slag color in contradiction to preliminary results from the floor laboratory.—Page 1238.

Your supply stocks cost you 25 per cent of their value each year for maintenance. At least that is the average figure revealed by a survey. The major portions of this 25 per cent are interest 6 per cent, depreciation 5 per cent and obsolescence 10 per cent.—Page 1240.

* * *

Emergency spare equipment is often a costly luxury. Caution in procuring spares is suggested, now that welding makes quick repairs possible, and with the trend toward heavier and improved equipment.—Page 1240.

* * *

Phenomenal gains in scrap exports are due partly to trade restrictions on scrap exports in some foreign countries. Another factor is the increase in proportion of scrap charged. Outside of Canada, Italy and Poland are our largest customers. — Page 1245.

* * *

Failures in thermit welds are due more to inadequate preheating than to any other cause. The joint should be uniformly and deeply heated to a high temperature with a reducing flame.—Page 1233.

* * *

Pig iron output sets new October record. Daily average production was 115,745 gross tons, which was ¾ of 1 per cent under September. On Nov. 1 there were 203 furnaces in blast, a net loss of two for the month.—Page 1258.

* * *

Correction of the speculative orgy will have some adverse effect on business. The degree will depend largely upon industrial behavior yet to come. If producers refuse to recognize that anything has happened and continue to produce carelessly they may quickly begin to build up inventories.—Page 1254.

THE IRON AGE

W. W. MACON
Managing Editor

ESTABLISHED 1855

Hopeful Disillusionment

IN commenting last week upon the successive crashes in the stock market, THE IRON AGE suggested that the wholesale and at times frantic dumping of securities was out of keeping with the very moderate slackening in business that had come in September and October. The highest authorities, including the experienced and erudite President of the United States, agree that business conditions are now good. Are they going to continue good? Nobody is now looking at the stock market as a barometer. We are thinking of it as a prime mover and of its débris possibly becoming grit in our machinery. Let us therefore review what fundamentally has happened.

We started with certain physical assets, represented largely by certificates of corporate stock. We have added to those assets and represented the addition by more stock. On the whole those additions have been well conceived. We do not think of any major miscalculation, implying loss or lock-up of capital and long delayed realization of earnings. So far so good. We then proceeded to write up the value of all this property through its paper and now we have written it down again. These processes have been attended by great changes in personal ownership, and by much change of status from that of mortgagees to partners, but fundamentally there has been neither gain nor loss. Elementally it would have been merely a bookkeeping record of rise and fall. There are many conservative individuals whose affairs find themselves in precisely that position.

There have been, however, disturbing interventions. In the first place the Federal and State governments have abstracted a large slice in their taxes computed on an inflated basis. Some persons holding stock A at $100 and selling it at $200 and buying stock B at $200 now find themselves with stock B at $100 and are out 12.5 per cent of $100 that they handed over to the Federal tax gatherer. The executors of persons who have died during the last three years have paid inheritance taxes on inflated valuations. Besides giving the tax-gatherer his cut, some persons who have realized profits on the rise have bought automobiles, jewelry, furs and other unproductive goods, not to speak of purchases from bootleggers and expenditures in night clubs that represent immediate consumption, even profligacy. Such events may follow not merely from realization, but also from the borrowing of credit against securities at inflated value. Margin calls by brokers are not the only thing that may force selling in a declining market. There are men who can read this recital and reflect that all of these things have happened in their own experience during the last two years.

It is evident, therefore, that all of the national savings that are made during a bull speculative period do not go into new capital goods and that there is an increased diversion of them via the tax-gatherer, the purveyor of amusements, etc., into consumption goods; all of which makes for activity in business, but in ways that are bound to wither when winter comes. Therefore it is idle to argue that the correction of the speculative orgy will not have some adverse effect upon business. The only question is how bad will be its effect.

The last is something that no one can foretell, for it will depend largely upon industrial behavior yet to come. In any event we should not naturally look for anything more than one of the minor depressions that result from the accumulation of unsold stocks of goods. But if producers refuse to recognize that anything has happened and continue to output carelessly they may quickly begin to build up inventories. If on the other hand they be cautious and aim to adjust themselves in advance to a curtailed consumptive demand they will save themselves much worry later on.

A no inconsiderable factor in our present situation is the psychological; in many respects, one of which is the attitude of labor. The mass of industrial workers had imbibed the notion that we were in an era in which money had become easy to get; and even if they did not try to play the stock market they had thought the time opportune to insist on advances in wages. If the idea can be made to seep into the halls of the labor unions that everybody else has awakened from a great illusion, and if it can be made easier to build houses and other things, there will be an improved demand for materials that will be a substantial amelioration.

Manufacturers who have been under such pressure to produce that they have postponed plant changes or given less than due thought to new economies should now be in position to use some of their working force in other than regular production lines. In such ways unemployment will be minimized and the interval before the resumption of full prosperity materially shortened.

Steel Prices Did Not Advance

DURING this 1929 period of exceptionally heavy demand for steel, taxing for a time the mill capacity and throwing deliveries behindhand, steel prices did not advance. It is well to state this fact definitely for men are prone to assume that steel did what might be expected of it. At this time it is of no great moment to consider why prices did not advance. The mills were indisposed to press their advantage as they wanted stability above all things.

What prices did in the last two years—and we are of course simply considering the market as a whole, represented by THE IRON AGE'S finished steel composite—was to cease declining as they had been doing for years preceding. Our composite stood last week at 2.362 cents per pound of products representing seven-eighths of the total steel output. The low for many years came on Oct. 25, 1927, at 2.293 cents. There is an advance from that point of $1.38 per net ton, but a low is not an average. There had been a long period of declining prices, as shown by the following annual averages of our composite, in cents per pound:

1923	2.738
1924	2.609
1925	2.465
1926	2.439
1927	2.357
Average	2.522

With some slight declines in the past few months last week's level was just at the average of 1927, the low year in many years. The mills have not been able to make much reduction in costs in the last two years, relative to reductions in previous years. Their recent large earnings have been due to high operating rates, distributing overhead in an industry so highly mechanized that with full operation the last 10 or 20 per cent of output adds but little to total cost. With a lighter operation unit costs increase and mills should not be expected to make the matter worse by cutting prices.

Steel Corporation-Columbia Deal

TWENTY-TWO years, almost to a day, after its purchase of the Tennessee Coal, Iron & Railroad Co., in the midst of the panic of 1907, the United States Steel Corporation announces that it has bought the assets of the Columbia Steel Corporation, the leading producer of steel on the Pacific Coast. Back in 1907 it was estimated that the Steel Corporation owned close to 60 per cent of the steel-making capacity of the country and that the Tennessee company purchase increased this by about 4 per cent. By the official statistics for 1928 the Steel Corporation produced 39.1 per cent of the country's output of steel ingots and castings last year, showing a marked downward change in its relation to the independent companies in the 22 years. Also by contrast with the transaction of 1907, the acquisition of the Columbia Steel Corporation properties adds scarcely 1½ per cent to the steel-making capacity of the leading interest, putting the latter at about 24,000,000 gross tons of ingots at the close of 1928.

In its comment on the Tennessee company purchase of 22 years ago THE IRON AGE observed that in spite of all that was said about the 700,000,000 tons of ore in the ground and the 2,000,000,000 tons of coal, any success the Steel Corporation might have in its future operations in Alabama would be largely due to what it carried southward in its own hands—to the money, the experience, the talent and the organization which it brought to the attack of the problem of steel making in the South. Much the same is now to be said of the corporation's future as a producer of steel on the Pacific Coast.

There will be different opinions in the steel trade on the question whether buyer or seller gained the more by the transaction just concluded. It is fair to say that neither the Steel Corporation nor any leading independent producer of steel has been looking with covetous eyes on any Pacific Coast steel property. It would appear that the bankers and other leading investors in the securities of the Columbia company were sooner and better convinced of the desirability of selling to the Steel Corporation than was the latter of the desirability of buying. They had found, as had those who owned the Tennessee company properties in the 20 years before the Steel Corporation regime, that steel manufacture is fairly insatiate in its demands upon capital. Creditable as the expansion of the industry on the Pacific Coast has been, and excellent as the condition of the leading plants, only a beginning has been made, and to cope with what is ahead may well call for greater resources than have yet been brought to bear on the problem.

No doubt the Steel Corporation judged that it stood to benefit by identifying itself with the future development of the Pacific Coast. That factor has probably counted for more in the recent negotiation than did the hope of Southern buying of Alabama steel in the deal of 1907. The completion of the Boulder Dam, the coming prosperity of the Imperial Valley, and the millions to be added to the Pacific Coast's population in the next decade are an alluring prospect.

Steel works operation under the even climatic conditions of the western coast also has some advantages, in escaping the costly mid-winter handicaps at most of the country's steel-making centers and the mid-summer limitations of the same districts. In respect to labor conditions, Pacific Coast steel makers have for some years been free from such union restrictions and militant methods as from time to time have plagued other industries there.

With the large and growing consumption of tin plate in the coast States it is to be expected that that product will have special consideration in the future extensions to which reference is made in the Steel Corporation's announcement of the Columbia purchase. Counting in Canada, not far from 400,000 tons of tin plate a year is now represented in the annual pack of food products on the Pacific Coast.

Employment in Consuming Steel

THERE is a complete reversal of conditions of 20 or 30 years ago in the relative amounts of labor involved in making and consuming steel. In the old days we heard much about possible labor shortage in the steel industry when demand was heavy, and much about unemployment when demand was light. In a time of rising steel demand it required some courage to suggest that perhaps if there were a labor shortage it would restrict the consumption of steel as much as the production. Comments made on the state of general business paid much attention to employment in the making of steel as if steel once made and shipped from the mill passed immediately into ultimate consumption without any further work being involved.

Now we have a complete reversal. The iron and steel industry has become highly mechanized and employs much less labor per ton of output. Even in the exceptional case, the rolling of sheets and black plates for tinning, still done by hand, outputs per man are

very considerably increased. Blast furnaces employ relatively little labor and there are large rolling mills with widely varying output from time to time but practically the same labor employment.

It might be countered that the consumers of steel have also introduced mechanization. True, for the same operations, but the operations are different. Probably freight cars are built with considerably fewer men per car than 20 years and more ago but we are not building as many freight cars although making much more steel. Even in the old days there was not much labor per ton in making freight cars. It requires little labor to lay rails but we are making scarcely as many rails as 20 years and more ago. In fabricating and erecting steel there may be less labor per ton than formerly but there never was much and the character of buildings erected nowadays requires much more labor for the other work.

The doubling in steel tonnage in 20 years has been largely along the line of steel being employed in smaller forms, where much more labor per ton is required to work up the mill product into the final thing for actual consumption. Witness the fact that sheet production has quadrupled in 20 years while the strip has risen from nothing to an item of more than two million gross tons. In the same time seamless tubing has risen from less than a hundred thousand to more than a million tons.

It is true that these light steel mill products which have grown so greatly go largely into apparently automatic machinery; but then there is the machinery itself, the building of which must be taken into account. We build a great deal more machinery than formerly and employ much labor in doing so, relative to the amount of steel consumed in making the machinery.

For the automobile industry figures are presented in the annual handbook of the trade, setting forth 1928 employment in automobile plants at 402,138 and in parts and accessory factories (not including tire factories) at 200,000, making, say, 600,000 workers, while according to the finding of THE IRON AGE 18 per cent of the steel made in 1928 went to the industry.

Putting Waste to Use

MORE and more of a factor in recent years in cutting manufacturing costs in the United States has been the use of what previously was waste material. It is not alone that a thing once called waste is now made useful, but the old-time expense of getting rid of it is entirely obviated. Long familiar in the iron industry is the turning of blast furnace slag into cement. Then we have had the conversion of crushed sugar-cane stalks (bagasse) into insulating material for buildings, as is done in the South; the making of refractories from broken firebrick, etc. Toy manufacturers use sheet steel scrap from automobile body plants. Among prepared shingle roofings a new product is surfaced by crushing the waste taken from coal mine dumps.

One of the most recent examples of salvage has been the putting of fine abrasive dust into useful employment in the building industry. This dust is mixed with marble flakes, concrete, terrazzo composition and other materials, is molded into tiles or such other shapes as may be required and, after being properly fired, is ground to final condition. The hard, abrasive particles resist both slipping and wear.

At first it was thought that preventing a floor or stair from becoming slippery, thus promoting safety, was the important factor in the new product. As is often the case, however, in practice it was found that the most useful quality was something else. This is its resistance to wear and its consequently greater durability, compared with some other materials.

Cost reduction through multiplying machine power behind the worker may often have more incentive and be more spectacular than preventing waste or turning it into a by-product. But the latter has the merit of being frequently attained by relatively small outlay and of enlisting more minds in its pursuit than do intricate problems of mass production.

CORRESPONDENCE

Cost Factors in Diesel Engine Plant

To the Editor: In your issue of Oct. 10, there was an article on a Diesel equipped plant by Edgar J. Kates, consulting engineer, New York.

It seems to me there were one or two important factors omitted from this article—the interest on the investment and the depreciation. These two facts we would like to learn about, and hope you may procure this information.

J. B. CLAY,
President, Clay Equipment Co.

Cedar Rapids, Iowa.

To the Editor: The cost of the 160-kw. Diesel power plant installed under my supervision at the plant of the Vulcan Rail & Construction Co., completely installed, was $24,000. Instead of including estimates of interest on investment and depreciation, a simpler and quite common method of presenting the facts was adopted in my article.

The actual outlays for operating the private power plant for 17 months were $1,513.77, while purchased current would have cost $8,065.29 for the same amount of power. This is an average saving in cash outlay of $385 per month, which if applied to paying off the initial investment will amortize it in less than six years. After the investment has been paid off, the $385 per month will be net profit, at the rate of over 19 per cent on the original capital.

If the other system of accounting is preferred, i. e., to assume fixed charges and include them in the current costs, these charges may be figured as follows:

Interest on initial investment ...	6.00 per cent
Depreciation, based on 20 year life and depreciation fund earning 6 per cent interest	2.72
Taxes and insurance, say,.....	1.28
Total fixed charges .....10.00 per cent	

These fixed charges amount to $200.00 per month. For the 7 months ended July 31, 1929, the generating cost averaged $153.41 per month, thus making an overall cost of Diesel power of $353.41 per month as compared with $489.67 for purchased current. When the load on the plant increases the saving will become still larger, as the cost of the additional power will be merely that of the extra fuel oil, which is only 0.63 c. a kwhr.

EDGAR J. KATES.

570 Seventh Avenue, New York

A Confident View of the Future in Steel

A Pennsylvania steel company sent the following telegram to its sales offices and sales representatives last week, following the stock market crash of Oct. 29. Its tenor is representative of the confident spirit in which the steel industry faces the business developments of the weeks just ahead:

"The trip home from a fool's paradise has been a hurried one and return tickets will only be given those failing to concentrate on their jobs. Work hard and rely on the great natural resources and the growth of the country and the common sense of the American people. We may be facing some temporary let-down in business, and the only way to minimize this effect is to redouble your efforts to secure sufficient tonnage to keep us running to a profitable capacity. You have back of you a company with low costs, no funded debt and an organization whose entire energies are devoted to the production and distribution of high grade products. You will find this an asset in securing orders, as the reduction of inventories and quick deliveries for emergency jobs will intensify the need for quick service, and we are here to serve. Do not waste your energy and typewriter ribbon writing us hard luck stories of work suspended and stock market losses. We can match these with experiences of conservative investors refusing to be stampeded and a list of impending projects for new building and expansion that will far outweigh the temporary effect of the financial debauch."

Micromatic Hone Company Organized

The Micromatic Hone Corporation, recently organized to take over the Jeschke Tool Corporation, will maintain offices at 5057 Woodward Avenue and plant at 14220 Mack Avenue, Detroit. The reorganization was brought about through the H. W. Holmes Corporation, Detroit, industrial engineers, which owns and operates the Detroit Machine Tool Co. and other companies.

Officers of the Micromatic corporation are: K. W. Connor, president and general manager; H. W. Holmes, vice-president in charge of engineering; R. M. McGuire, sales manager; F. M. Kern, factory manager; R. E. Allport, director of purchases, and G. E. Eyestone, treasurer. These officers, together with H. A. G. Jeschke, comprise the board of directors. Development and field engineering work will be headed by Frank Jeschke and G. M. Calvert.

The Week in Business

Drift of Current Financial and Economic Opinion

"A BIG blister has burst on the skin of America. It looks uglier than an internal ulcer but is not nearly so dangerous," says the Manchester (England) *Guardian* in commenting on the recent collapse of the New York Stock Market.

This view emphasizes the superficial character of the crash, in contrast with previous major Wall Street crises, when readjustment was more sweeping, affecting industry and trade with the same force with which it shook the securities market. Moreover, deflation of the speculative boom, in the opinion of leading analysts, was necessary to relieve business of the burden of tight money. "Most experienced people," writes Alexander D. Noyes, New York *Times*, "believe that continuance of prosperity was in the long run best guaranteed by the bursting of the Wall Street bubble."

"One thing is assured—namely that no scarcity of funds for the industrial and commercial world will now ensue," asserts Bache *Review*. Brokers' loans shrunk $1,096,000,000 last week, while the New York Federal Reserve Bank cut its rediscount rate from 6 per cent to 5 per cent and rate reductions were announced by the Bank of England and other central banks in Europe.

Immediate Effect on Business

But the first effect of the market break on business is likely to be adverse, in the opinion of the Alexander Hamilton Institute. "A sound banking situation and the prospect of easier money will not, of itself, bring about a revival of business, but its normal effect is to contribute to a more speedy recuperation than would otherwise be likely."

The Institute agrees with other commentators that commodity prices are not inflated, but believes that inventories, although presenting no such problem as in 1921, are larger in some lines than is generally realized. Even without this possible factor the psychological effect of the securities crash on business will probably be increased hesitancy and caution, leading to closer than normal buying.

The extent that the buying power of the public has been reduced by stock market losses is an unanswered question. Dr. Julius Klein, Assistant Secretary of Commerce, estimates that speculative accounts numbered about a million and that these would involve less than 4 per cent of all the families of the nation.

Reduction in Buying Power Exaggerated

It is pointed out also that in many cases only paper losses were sustained. A further consideration is that the securities values wiped out did not represent anything like the same reduction in the demand for goods. When speculative profits were taken, during the late boom, they were frequently shifted to some other form of investment, according to the Hamilton Institute.

The sharp recovery of the stock market on Oct. 30 and Oct. 31 also indicates that the impairment of consumer purchasing power should not be overestimated. The wild rush to sell on Oct. 28 and Oct. 29 deflated securities 20 to 30 billion dollars, but 80 to 90 per cent of the losses were made up in the succeeding two days, the New York *Herald Tribune* points out.

Federal Reserve Turned Tide

The turn in the market is generally ascribed to purchases by a banking pool and to reassuring public statements by John D. Rockefeller and others; but Norman Merriman, economist, Ungerleider Financial Corporation, declares that the main factor in stemming the decline was the release by the Federal Reserve banks of the largest amount of credit ever to set free in one week in the history of the Reserve system ($312,000,000). This was reflected in a reduction in margins required on brokerage loans to 25 per cent, from a previous minimum of 40 to 60 per cent. Speculators who were about to throw their stocks overboard found their margins adequate. Prospective buyers were chase securities.

"All told," Mr. Merriman asserts, "it was merely the freeing of credit on a large scale which prevented the disastrous break from becoming the most severe panic in financial history."

A Record October in Iron Output

Daily Rate Less Than September by ¾ Per Cent or 840 Tons—Ten Months' Total 6 Per Cent Over Next Largest—Net Loss of Two Furnaces

WITH actual production reported from all operating furnaces, the October coke pig iron output declined less than one per cent from the revised data for September. Because of errors in estimates and transmission on Oct. 1, September production was revised upward. The October production was a new total for that month and for 10 months a new high was attained.

Output in October was at the rate of 115,745 gross tons per day, a decline of 840 tons or 0.72 per cent from the September rate of 116,585 tons per day. The nearest approach to this for the same month was 113,189 tons per day in October, 1916. The October daily rate was the smallest since March, this year, when it was 114,507 tons. In October, 1928, the daily rate was 108,832 tons.

Operating Rate on Nov. 1

Evidently there was a sharp decline in the operating rate of the furnaces active on Nov. 1. The 203 furnaces blowing on that day had an estimated operating rate of 113,600 tons daily compared with 116,405 tons per day for the 205 furnaces blowing on Oct. 1. The large difference for a loss of only two furnaces is

Daily Average Production of Coke Pig Iron in the United States by Months Since Jan. 1, 1925—Gross Tons

	1925	1926	1927	1928	1929
Jan.	108,720	106,974	100,123	92,573	111,044

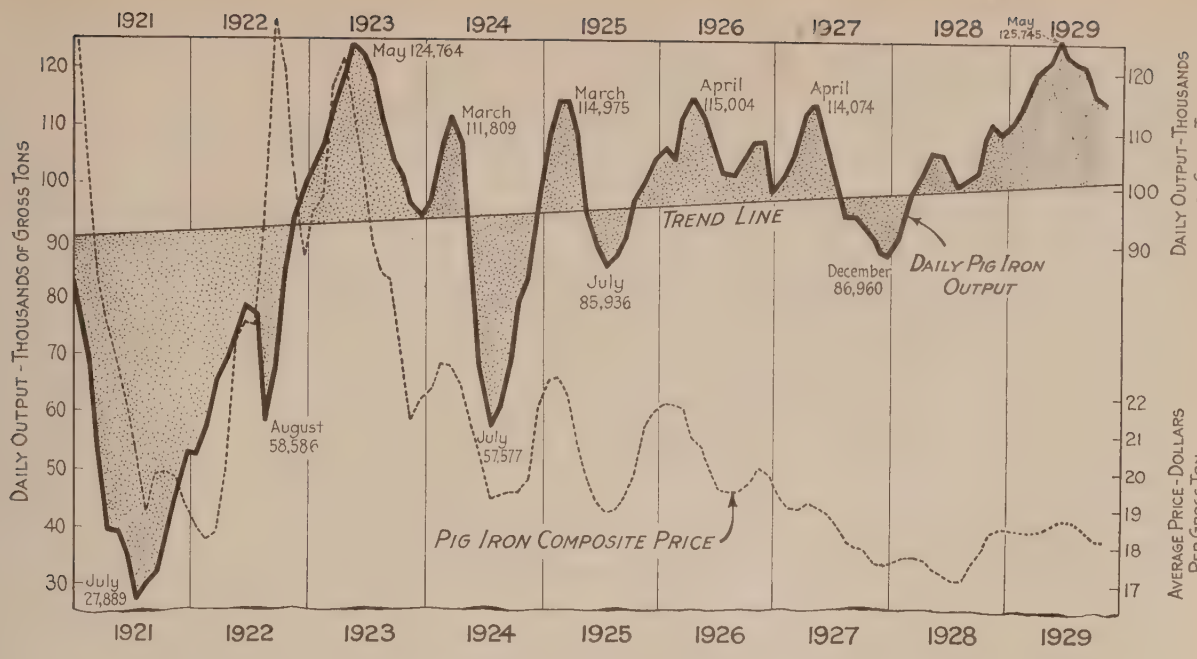
**These totals do not include charcoal pig iron. The 1928 production of this iron was 142,960 gross tons.*



For Eight Months Production of Pig Iron Has Exceeded the Peak of Five Preceding Years

Inclined line represents the gradually increasing theoretical needs of the country, ascertained by a balancing of the ups and downs in production. It shows an average yearly increase in consumption of about 423,000 tons

due to a marked lowering of the rate toward the end of the month with a number of furnaces shut down on Oct. 31 and Nov. 1. Eight furnaces were blown in and 10 were shut down by Nov. 1—a net loss of two. In September there was a net loss of 5 furnaces.

The Steel Corporation blew out seven furnaces and blew in two while independent steel companies blew in three and shut down two—a net loss of four steel-making stacks. Three merchant furnaces were blown in and one was blown out—a net gain of two. Thus the net loss for the month was two steel-making stacks.

New Record for Ten Months

For the ten months ended with October a new high for any such period was recorded—36,267,442 tons. The nearest approach to this was 34,244,031 tons to Nov. 1, 1923, an increase this year of 2,023,411 tons, an increase of almost 6 per cent.

Steel-Making Iron Declines

Loss in steel-making iron was 1782 tons per day from September with the production 93,644 tons per day against 95,426 tons per day in September. Merchant iron gained in October at 22,101 tons per day compared with 21,159 tons each day in September.

Large Gain in Ferromanganese

At 31,108 tons as the production of ferromanganese in October, the month's total was the second largest this year. The high for the year was 33,363 tons in June. A Western steel company blew in a furnace on ferromanganese last month.

Possibly Active Stacks Reduced

With the dismantling of the Big Stone Gap furnace of the Intermont Coal & Iron Corporation in Virginia, the possibly active stacks in the United States has been reduced from 318 to 317.

Furnaces Blown In and Out

Among the furnaces blown in during October were one furnace of the Witherbee-Sherman Co., Port Henry, N. Y.; the Pulaski furnace in Virginia; one Toledo furnace in northern Ohio; No. 5 Iroquois furnace of the Youngstown Sheet & Tube Co. in the Chicago district; one furnace of the Colorado Fuel & Iron Co., in Colorado; one Pioneer furnace of the Republic Iron & Steel Co. and one Bessemer and one Ensley furnace of the Tennessee Coal, Iron & Railroad Co. in Alabama.

Among the furnaces blown out or banked during October were one Carrie and one Edgar Thomson furnace of the Carnegie Steel Co. and one Eliza furnace of the Jones & Laughlin Steel Corporation in the Pittsburgh district; the Colonial furnace in western Pennsylvania; one furnace of the Carnegie Steel Co. in the Mahoning Valley; two Newcastle and one Farrell furnace of the Carnegie Steel Co. in the Shenango Valley and No. 2 Weirton furnace of the Weirton Steel Co. in the Wheeling district.

Iron and Steel Markets

Buying Becomes More Cautious

Initial Effect of Stock Market Break Is a Decline in New Business—Specifications Hold Up Well—Cold-Finished Bars Cut $2 a Ton

THE initial effect of the stock market break on the iron and steel industry has been to accentuate caution on the part of buyers. New business has been light and the placing of some prospective tonnage has been delayed, indicating that purchasers wish to obtain a better appraisal of the influence of the securities debacle on their own businesses before making further commitments in raw materials.

Cancellations reported, however, are almost negligible and specifications against unfilled orders have held up well, with reductions chiefly of the kind that would have been made regardless of developments in Wall Street.

The low iron and steel inventories of large consuming industries are one of the favorable features of the situation. Many companies that use steel in a big way have no more than a fortnight's supply. Jobbers' stocks, also, are reported to be low.

If there is an inventory problem among manufacturing users of iron and steel, it is due more largely to an accumulation of finished product than to the stocking of materials. Supplies of manufactured goods that have heretofore been regarded as normal might easily become excessive if the buying power of ultimate consumers were seriously curtailed.

Thus far few evidences of reduced popular demand for consumption goods have appeared except in the automobile industry. Motor car manufacture was suffering from the effects of overproduction before the stock market collapse, being one of the few outlets for steel in which excessive activity developed, but the period of readjustment, if present indications are borne out, has been prolonged by the Wall Street crash. Automobile makers generally are revising production schedules downward.

Consumer demand for goods outside of the luxury or semi-luxury class is expected to hold its own unless serious unemployment should develop. Farm implement manufacturers have not altered their production programs, which remain at a high rate. The output of stove manufacturers in the St. Louis district is one-third greater than a year ago. Operations of a leading radiator manufacturer are the highest since February.

Although carefully appraising possible unfavorable effects from stock market liquidation, the iron and steel trade is not closing its eyes to the benefits that will accrue, especially from easier money. Chicago reports that a more active bond market will release a large accumulation of public improvement work, and that the floating of mortgage loans will have a stimulating effect on private building within six or eight weeks. According to more conservative opinion, based on past experience, lower money rates are unlikely to result in any general acceleration of building activity for four or five months.

A quicker reaction is looked for in the demand for railroad equipment, since lower money rates will enable the carriers to market equipment trust certificates more easily. Demand for rolling stock was active even before the stock market break, but more favorable buying terms are expected to speed up action on pending inquiries and to bring out new equipment programs. Freight cars now in the market number 14,000, including 2300 on which the Missouri Pacific has just asked for figures. Inquiries from Eastern lines for 20,000 additional cars are looked for before Jan. 1. The Missouri Pacific, the St. Louis-San Francisco, the Rock Island and the Wabash have asked for tenders on a total of 125 locomotives.

Rail contracts have been swelled by an order from the Missouri Pacific for 61,000 tons, reported anonymously a week ago as only 40,000 tons. The Southern Pacific has entered the market for 122,000 tons.

Iron and steel prices remain relatively steady. Cold-finished bars and shafting have been marked down $2 a ton and black sheets at Chicago have receded by a similar amount, but with these exceptions no general reductions have been made. Scrap markets are weaker. Although no price reductions are reported at Pittsburgh, heavy melting steel has dropped 25c. a ton at Chicago, with declines in other grades ranging up to $2.50 a ton. At St. Louis consumer buying of scrap has practically ceased and cancellations and suspensions are reported.

Steel ingot output has receded to 60 per cent in the Valley district and to 75 per cent at Pittsburgh and Cleveland, but remains at 80 per cent at Chicago. The average for Steel Corporation subsidiaries and for the Bethlehem plants is estimated at 82 per cent. October output of steel was held up, in part, by the stocking of ingots and semi-finished steel, but this cannot be continued.

Pig iron production in October totaled 3,588,118 tons, the largest output for that month on record. At 115,745 tons, the daily rate showed a decline of only 0.72 per cent from that of September. There was a net loss of two active stacks in the month, eight having been blown in and ten having been put out. The operating rate Nov. 1 was 113,600 tons, compared with 116,405 tons on Oct. 1.

THE IRON AGE composite prices are unchanged, finished steel at 2.362c. a lb. and pig iron at $18.38 a ton.

Pittsburgh

Curtailment of Orders for Steel Follows Stock Market Break—Production is Moderately Lower

PITTSBURGH, Nov. 4.—While steel companies in this and nearby districts felt an immediate adverse effect from the recent sharp decline in stock prices, no signs of an extended period of depression are yet in evidence. New buying last week was exceedingly light, but tonnage releases came in at about the same rate as they did during October. In some cases, specifications were reduced somewhat, but such curtailment was generally to be expected and would have undoubtedly occurred in spite of the trend of the financial markets. On the other hand, buyers of steel who had contemplated increasing their steel needs or had planned to place orders in the near future, have now postponed their action.

Curtailment in steel works operations continues in this and nearby districts, but there is no evidence that it is being hastened by uncertainty in financial markets.

The Steel Corporation subsidiary took off four blast furnaces at its Valley plants during October, but reduced its active stacks in the Pittsburgh district by only one furnace. This is in line with the trend of open-hearth operations in the two districts, as the rate in the Valleys is not far above 60 per cent this week, while Pittsburgh plants are still above 75 on the average. The latter figure is possible, however, largely because of the comparatively high rate of the leading interest, which is benefiting by recent rail tonnage and heavy backlogs of structural shapes and plates.

While the principal independent steel producer in the Pittsburgh area is not so well supplied with advance work, its operating rate is above the average and compares favorably with the operations of the smaller independent companies, some of which are at at low as 50 per cent of capacity.

Finishing mills, especially in the Youngstown area, are running somewhat better than the open-hearth departments, as many companies accumulated stocks of crude steel during October and are now anxious to reduce their inventories as rapidly as possible.

The very low inventories of the large steel-consuming industries offer the most certain indication of the healthy state of the steel industry. Scarcely any company which uses steel in a large way could operate for two weeks if its steel supply were to be cut off. Stocks of steel jobbers are also low and nothing short of a complete paralysis of the country's business would force makers of steel into really serious difficulties. For this reason, the attitude of Pittsburgh companies is still hopeful and the extreme pessimism which accompanied the sharp break in stock prices last week has been changed to a feeling of confidence in the basic soundness of the business situation.

Steel company executives have not lost sight of the fact that the remainder of the year may be rather quiet from a business standpoint, with the automobile industry taking less than half its usual tonnage of steel, but other consumers, notably the railroads, are helping to fill in the breach. In

fact, it is expected that large Eastern roads may add about 20,000 freight cars to the pending list before the first of the year.

The price situation is still generally satisfactory, although the reduction of $2 a ton in the price of cold-finished steel bars and shafting last week was considered ill-timed by some makers. Bars, shapes and plates are holding at 1.90c., Pittsburgh, although this figure has not been widely tested on large tonnages. This is true with a number of present quotations, but sellers have no difficulty in maintaining prices on small tonnages which are being closed from day to day. It is generally admitted by both buyers and sellers that lower prices would not stimulate buying to any extent at the present time.

The pig iron market is hardly as strong as it has been. Although definite reports of shading the Valley furnace prices are lacking, recent sales of basic iron by Pittsburgh district furnaces have been subject to question from the price standpoint.

Scrap is not quotably lower, but the trend of the market is toward weakness. A recent sale of railroad heavy melting steel brought close to $17.50 at a nearby steel plant, but the Pennsylvania Railroad steel, which closes this week, may not bring such a high figure.

Pig Iron.—The pig iron market lacks strength, and prices are holding largely because of a lack of heavy tonnage buying. Most sellers freely admit that a large tonnage of basic or foundry iron would bring out quotations under $18.50, Valley, but recent buying has offered no such situation. Purchases are still confined to small lots, which command the full market quotations on basic and foundry as well as on malleable and Bessemer. The Edgewater Steel Co. is reported to have bought a tonnage of basic iron, but information is lacking as to the amount involved and the price paid. The Elliott Co., Jeannette, Pa., has closed with several makers for about 600 tons of foundry iron and 150 tons of Bessemer. This business is reported to have brought the full market price. Iron shipments from both Valley and Pittsburgh furnaces are now somewhat lighter than production, and makers are watching the trend of business very closely in an effort to decide whether or not to blow out furnaces. Unless conditions improve in the next two weeks, it is likely that at least one less merchant stack will be operating. The Weirton Steel Co., which was a buyer of basic iron during the summer months, has blown out one of its furnaces for relining.

Prices per gross ton, f.o.b. Valley furnace:

Basic	$18.50
Bessemer	19.00
Gray forge	18.00
No. 2 foundry	18.50
No. 3 foundry	18.00
Malleable	19.00
Low phos., copper free	27.00

Freight rate to Pittsburgh or Cleveland district $1.76.

Prices per gross ton, f.o.b. Pittsburgh district furnace:

Basic	$19.00
No. 2 foundry	19.00
No. 3 foundry	18.50
Malleable	19.50

Freight rates to points in Pittsburgh district range from 63c. to $1.13.

Semi-Finished Steel. — Occasional spot sales of billets, slabs and sheet bars are reported in this district, and one seller, most of whose business is done under long-time contracts, is having no difficulty getting $35, Pittsburgh or Youngstown, with full extras for this material. Concessions might be obtained if a fair inquiry came out, but, as a great percentage of semi-finished steel to be used this quarter is already contracted for, the spot market can still be quoted at the above figure. Considerable tonnage is undoubtedly moving at lower prices, but as large buyers seldom, if ever, pay the full quoted price for their material, there seems to be no reason to recognize this tonnage as establishing the market now. Shipments of semi-finished steel during October declined somewhat from those of the previous month, but the decline has been very gradual. The early days of November have brought no decrease in shipments, although some companies which had contemplated increasing their takings are now inclined to wait for a time. This is particularly true in the case of makers of strips and sheets, who have failed to see any marked improvement in their business in the last few days and who wish to maintain supplies of crude steel at a minimum. The price of forging billets is open to question on occasional transactions, but no sales at less than $40, Pittsburgh, are reported. The $40 price on wire rods seems to be well established, although business is exceedingly quiet.

Rails and Track Accessories.—Business has been rather quiet in the last week. This district did not participate in the recent order for 61,000 tons of rails placed by the Missouri Pacific. Specifications for accessories are beginning to improve somewhat, particularly from roads which placed rails early in the season. Demand for light rails is improving seasonally, as the coal industry is rather active at this time. Rail mill operations are continuing to improve, but have not yet reached capacity rate.

Bars, Shapes and Plates.—Business has been exceedingly quiet during the week, but the larger companies have received no orders for hold-ups or cancellations of shipments. Demand for plates is comparatively strong, although quick deliveries are possible from most of the leading mills. Specifications from the car builders are coming in regularly, but shipments to barge yards in this district are declining as most of the barges ordered in the spring and summer have now been completed. However, the prospects in this field are exceedingly good, and, with one large inquiry for barges still pending and several others in process of negotiation, there is every reason to believe that this industry will be a large user of steel over the next few months. Fabricating shops are busy, and shape mills have curtailed operations very little as compared with other departments. Bars are quiet, as many of the large consuming industries are operating at a low rate. The price on bars, shapes and plates has settled to 1.90c., Pittsburgh, and this now represents the maximum on all but occasional small orders. This price seems to be reasonably firm, although large buyers undoubtedly obtain the usual differentials.

Wire Products.—The wire mill situation is essentially unchanged, but if there is any noticeable tendency it is toward further price stabiliza-

Long Ternes

No. 24, 8-lb. coating, f.o.b. mill	4.00c. to 4.10c.

Vitreous Enameling Stock

No. 24, f.o.b. Pittsburgh	3.90c.

Tin Plate

	Per Base Box
Standard cokes, f.o.b. P'gh district mills	$5.35
Standard cokes, f.o.b. Gary	5.45

Terne Plate

(*F.o.b. Morgantown or Pittsburgh*)
(Per Package, 20 x 28 in.)

8-lb. coating I.C.	$11.20
15-lb. coating I.C.	14.00
20-lb. coating I.C.	15.30
25-lb. coating I.C.	$16.70
30-lb. coating I.C.	17.75
40-lb. coating I.C.	19.35

Alloy Steel Bars

(F.o.b. makers' mill)

Alloy Quality Bar Base, 2.65c. to 2.75c. per Lb.

S.A.E. Series Numbers	Alloy	Differential
2000	(½% Nickel)	$0.25
2100	(1½% Nickel)	0.55
2300	(3½% Nickel)	1.50
2500	(5% Nickel)	2.25
3100	Nickel Chromium	0.55
3200	Nickel Chromium	1.35
3300	Nickel Chromium	3.80
3400	Nickel Chromium	3.20
4100	Chromium Molybdenum (0.15 to 0.25 Molybdenum)	0.50
4100	Chromium Molybdenum (0.25 to 0.40 Molybdenum)	0.70
4600	Nickel Molybdenum (0.20 to 0.30 Molybdenum, 1.25 to 1.75 Nickel)	1.05
5100	Chromium Steel (0.60 to 0.90 Chromium)	0.35
5100	Chromium Steel (0.80 to 1.10 Chromium)	0.45
5100	Chromium Spring Steel	0.20
6100	Chromium Vanadium Bars	1.20
6100	Chromium Vanadium Spring Steel	0.95
9250	Silicon Manganese Spring Steel (flats)	0.25
	Rounds and squares	0.50
	Chromium Nickel Vanadium	1.50
	Carbon Vanadium	0.95

Above prices are for hot rolled steel bars, forging quality. The differential for cold-drawn bars is ¾c. a lb. higher, with standard classification for cold-finished alloy steel bars applying. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis.

Billets under 4 x 4 in. carry the steel bar base. Slabs with a sectional area of 16 in. or over carry the billet price. Slabs with sectional area of less than 16 in. or less than 2½ in. thick, regardless of sectional area, take the bar price.

Rails

	Per Gross Ton
Standard, f.o.b. mill	$43.00
Light (from billets), f.o.b. mill	36.00
Light (from rail steel), f.o.b. mill	34.00
Light (from billets), f.o.b. Ch'go mill	36.00

Track Equipment

	Base per 100 Lb.
Spikes, ⅝ in. and larger	$2.80
Spikes, ½ in. and smaller	2.80
Spikes, boat and barge	3.00
Tie plate, steel	2.15
Angle bars	$2.75
Track bolts, to steam railroads	$3.80 to 4.00
Track bolts, to jobbers, all sizes, per 100 count	70 per cent off list

Welded Pipe

Base Discounts, f.o.b. Pittsburgh District and Lorain, Ohio, Mills

Butt Weld

Steel Inches	Black	Galv.	Iron Inches	Black	Galv.
⅛	45	19½	¼ and ⅜	+11	+36
¼ to ⅜	51	25½	½	23	5
½	56	42½	¾	28	11
¾	60	48½	1 and 1¼	31	15
1 to 3	62	50½	1½ and 2	35	18

Lap Weld

2	55	43½	2	23	9
2½ to 6	59	47½	2½ to 3½	28	13
7 and 8	56	43½	4 to 6	30	17
9 and 10	54	42½	7 and 8	29	16
11 and 12	53	40½	9 to 12	26	11

Butt Weld, extra strong, plain ends

⅛	41	24½	¼ and ⅜	+13	+48
¼ to ⅜	47	30½	½	23	7
½	53	42½	¾	28	12
¾	58	47½	1 to 2	34	18
1 to 1½	60	49½			
2 to 3	61	50½			

Lap Weld, extra strong, plain ends

2	53	42½	½	29	13
2½ to 4	57	46½	2½ to 4	34	20
4½ to 6	56	45½	4½ to 6	33	19
7 to 8	52	39½	7 and 8	31	17
9 and 10	45	32½	9 to 12	21	8
11 and 12	44	31½			

On carloads the above discounts on steel pipe are increased on black by one point, with supplementary discount of 5%, and on galvanized by 1½ points, with supplementary discount of 5%. On iron pipe, both black and galvanized, the above discounts are increased to jobbers by one point with supplementary discounts of 5 and 2½%.

Note.—Chicago district mills have a base two points less than the above discounts. Chicago delivered base is 2½ points less. Freight is figured from Pittsburgh, Lorain, Ohio, and Chicago district mills, the billing being from the point producing the lowest price to destination.

Boiler Tubes

Base Discounts, f.o.b. Pittsburgh

Steel		Charcoal Iron	
2 in. and 2¼ in.	38	1½ in.	1
2½ in.—2¾ in.	46	1¾ in.	8
3 in.	52	2 in.—2¼ in.	13
3¼ in.—3¾ in.	54	2½ in.—2¾ in.	16
4 in.	57	3 in.	17
4½ in. to 6 in.	46	3¼ in. to 3½ in.	18
		4 in.	20
		4½ in.	21

On lots of a carload or more, the above base discounts are subject to a preferential of two fives on steel and of 10 per cent on charcoal iron tubes. Smaller quantities are subject to the following modifications from the base discounts:

Lap Welded Steel—Under 10,000 lb., 6 points under base and one five; 10,000 lb. to carload, 4 points under base and two fives. Charcoal Iron—Under 10,000 lb., 2 points under base; 10,000 lb. to carload, base and one five.

Standard Commercial Seamless Boiler Tubes

Cold Drawn

1 in.	61	3 in.	46
1¼ to 1½ in.	53	3¼ to 3½ in.	48
1¾ in.	37	4 in.	51
2 to 2¼ in.	32	4½, 5 and 6 in.	40
2½ to 2¾ in.	40		

Hot Rolled

2 and 2¼ in.	38	3¼ to 3½ in.	54
2½ and 2¾ in.	46	4 in.	57
3 in.	52	4½, 5 and 6 in.	46

Beyond the above base discounts a preferential discount of 5 per cent is allowed on carload lots. On less than carloads to 10,000 lb., base discounts are reduced 4 points with 5 per cent preferential; on less than 10,000 lb., base discounts are reduced 6 points, with no preferential. No extra for lengths up to and including 24 ft. Sizes smaller than 1 in. and lighter than standard gage take the mechanical tube list and discounts. Intermediate sizes and gages not listed take price of next larger outside diameter and heavier gage.

Seamless Mechanical Tubing

	Per Cent Off List
Carbon, 0.10% to 0.30%, base (carloads)	55
Carbon, 0.30% to 0.40% base	50

Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.

tion. In the immediate Pittsburgh district wire nails are holding at $2.50 to the trade, and jobbers are unable to get more than their regular $2 concession. The same is true as to plain wire to jobbers, and the price on wire to the manufacturing trade is unchanged at 2.40c. a lb., Pittsburgh. Demand is quiet. Shipments by some makers last month declined very sharply.

Bolts, Nuts and Rivets.—Business in bolts and nuts has experienced some decline in the last few weeks, but this was to be expected in view of the gradual tapering off of steel business in general. Jobbers' stocks of bolts, nuts and rivets are ample and they are now inclined to wait for further reduction in inventories before reordering. The car builders are still very good customers, as are fabricating shops and barge yards, and railroad demand is good. The average operating rate of the industry has declined to about 65 per cent of capacity, and the figure is lower in some plants. Prices are well established at 70 per cent off list for bolts and nuts, and $3.10 a 100 lb., Pittsburgh or Cleveland, for large rivets. Small rivets are quoted at 70 and 10 per cent off list.

Warehouse Business.—October was a fairly good month for local warehouses, although price weakness developed in some lines, and tonnage tapered off slightly in others. Generally speaking, business was about equal to the total of the same month last year. Both wire and wire nails are quotably lower, although a tendency toward strength in these products has developed in the last two weeks. Sheet steel is also weak, but local jobbers are maintaining their quotations in the face of occasional shading. Bars, plates and shapes are still holding fairly well.

Warehouse Prices, f.o.b. Pittsburgh

	Base per Lb.
Plates	3.00c.
Structural shapes	3.00c.
Soft steel bars and small shapes	2.90c.
Reinforcing steel bars	2.75c.
Cold-finished and screw stock—	
Rounds and hexagons	3.60c.
Squares and flats	4.10c.
Bands	3.25c.
Hoops	4.25c.
Black sheets (No. 24), 25 or more bundles	3.80c. to 3.90c.
Galv. sheets (No. 24), 25 or more bundles	4.45c. to 4.55c.
Light plates, blue annealed (No. 10), 1 to 24 plates	3.35c. to 3.45c.
Blue annealed sheets (No. 13), 1 to 24 sheets	3.50c. to 3.60c.
Galv. corrug. sheets (No. 28), per square	$4.43
Spikes, large	3.40c.
Small	3.80c. to 5.25c.

Track bolts, all sizes, per 100 count,	60 per cent off list
Machine bolts, 100 count,	60 per cent off list
Carriage bolts, 100 count,	60 per cent off list
Nuts, all styles, 100 count,	60 per cent off list
Large rivets, base per 100 lb.	$3.50
Wire, black soft ann'l'd base per 100 lb	$2.90 to 3.00
Wire, galv. soft, base per 100 lb.	2.90 to 3.00
Common wire nails, per keg	2.80 to 2.90
Cement coated nails, per keg	2.95 to 3.05

Tubular Products.—Pipe mill operations are gradually declining, although the present rate is still somewhat higher than the year's average, and had declined only about five points from the maximum reached a few weeks ago. The average for the entire industry is estimated at somewhere between 60 to 65 per cent of capacity, with seamless mills at a slightly higher rate and butt-weld units somewhat lower. Demand for the latter product is expected to decline seasonally, and demand for seamless material is also experiencing a slight decline in the oil country. Large orders for lap-weld tubing have practically all been executed and mills are now operating on a hand-to-mouth basis, with business made up largely of feeder lines and other small tonnage business. There are good orders for boiler tubes and locomotive tubing, but declining operations in the automobile industry have brought about a marked decrease in the movement of mechanical tubing. Prices are reasonably firm.

Prices on black and galvanized steel butt-weld pipe and also on iron pipe have been advanced slightly by the elimination of the extra 2½ per cent discount, which had recently been extended to include the smaller jobbers. The 2½ per cent discount is now given only to the larger buyers.

Tin Plate.—Tin plate operations have not declined further in the last week, and the average for the industry continues at about 60 per cent of capacity. The leading interest is operating at a slightly higher rate, as it has been able to begin work on anticipated tonnage for 1930 before the independent companies. The price for next year has not yet been announced, and opinion varies as to what it may be. It does seem rather certain that there will be no advance.

Strip Steel.—Any improvement expected in the automotive trade this week was evidently postponed by the financial situation, and demand has generally been light. Operations continue at about 50 per cent of capacity and this rate is just about sufficient to meet current requirements. Consumers are generally thought to be without stock accumulations and no sharp decline in shipments is expected over the next few weeks. In fact, any improvement in demand from the automobile industry would be reflected immediately in shipments and rollings. Prices lack strength, but shading is confined to occasional sales where outside considerations have had a prominent influence. Cold-rolled material is now quotable at 2.75c., Pittsburgh, and hot-rolled at 1.90c. and 2c., Pittsburgh, depending upon the width.

Cold-Finished Steel Bars.—A rather sudden reduction of $2 a ton in the price of cold-finished bars has been met by producers in this district, although weakness was apparent heretofore principally in the Chicago district. The decrease was apparently prompted by recent reduction in the price of hot-rolled bars. The lower price has not stimulated business, which remains very quiet. However, the industry is in a favorable position. Most cold-finishing mills have little more than a two-weeks' supply of hot-rolled bars on hand and are constantly reducing this tonnage. The price is now 2.20c., Pittsburgh.

Prices on turned and ground shafting have also been reduced $2 a ton, and are now quoted at 2.55c. to 3.50c., base Pittsburgh, according to size.

Sheets.—The new month has failed to bring any improvement in the buying of sheets, and operations continue to taper. The average for the industry is probably not more than 60 per cent of capacity, with specialty mills at a lower rate, and the leading interest at about 70 per cent. Specifications last week were extremely light, although the stocks of some consumers are so low that they are forced to place rolling orders every few days if they are to keep their plants running. Demand from the automobile industry is still disappointing, and the largest maker of cars in the low-priced field has met with some delay in re-tooling its plants for slight model changes. Although this company's schedule formerly called for slightly less than 200,000 cars in the remaining two months of the year, this figure may have to be reduced. Other automobile makers, which had stepped up their production on new models, have curtailed again. The automobile industry is watching the trend of the security markets more carefully than any other large steel consumer. Other buyers of sheets are taking material at a fair rate, and many metal furniture makers are operating at close to capacity. Under such conditions, demand for metal furniture sheets is very strong, while the reverse is true with automobile body sheets. Auto sheet makers are also meeting with considerable price pressure, although the 4c. Pittsburgh price has not yet been broken. Black sheets are also holding at 2.75c., Pittsburgh, and concessions of $1 a ton are all that have been developed by large Michigan buyers. Galvanized sheets are still quotable at 3.50c., Pittsburgh, although the $2 preferential to jobbers is being given by a number of mills. Blue annealed sheets and light plates are holding fairly well.

Coal and Coke.—This market has seen little change, but the price tendency in furnace coke is toward weakness rather than strength. The steel companies are doing no buying and have reduced shipments rather sharply in recent weeks. Warm weather has had an adverse effect on the movement of domestic coke, and the foundry grade is only fairly active. Prices are unchanged on coke, while

Chicago

Steel Demand Has Tapered in Some Directions But Mill Output Remains at About 80 Per Cent

CHICAGO, Nov. 4.—Steel demand in some directions has tapered, but the increased movement of car materials and the prospect that this tonnage will gain larger proportions lend support to the belief in the local trade that production of steel in nearby weeks will be supported at about 80 per cent of ingot capacity, the current rate.

Farm implement manufacturers are holding to production schedules made early in the fall. It is not improbable that mortgage loans for building construction will, in the course of six to eight weeks, again support a more general and a larger demand for structural materials, and a more active bond market will afford the means of releasing a large amount of public improvement work which has been accumulating in and near Chicago.

Tendencies as to prices still lean to the weak side. Mild steel bars at 2c. to 2.05c. a lb., Chicago, are lacking in strength, and quotations on galvanized and black sheets have given ground in the last week. Cold-finished bars have been marked down $2 a ton, effective Nov. 1, for distribution from all basing points.

The local scrap market is wholly in the hands of buyers, who in many cases have accumulated sizable stocks and who will no longer listen to overtures by sellers. The stress of this situation appears not to have reached a culmination for the reason that supplies at points of production and in yards, both country and city, are accumulating at a rapid rate.

Current specifications for finished steel are well up to the average of recent weeks. Sales, though in good aggregate tonnage, are largely influenced by new business in rails and therefore do not give a clear picture of the market as a whole.

Pig Iron.—The Northern foundry iron market remains steady, with shipments practically equal to the full output of local furnaces. Shipments, which started to climb late in October, are still on the upswing. This situation leaves local producers with no opportunity to stock iron. Prices remain firm at $20 a ton, local furnaces. Scattered and small sales of charcoal iron are reported at $24 a ton, furnace. Among boat shipments which have arrived at Chicago docks in the last week are a cargo of silvery and one of low phosphorus iron. The Southern iron market remains at $13 to $13.50 a ton, Birmingham; the freight rate to Chicago is $6.01 a ton.

Prices per gross ton at Chicago:

N'th'n No. 2 fdy., sil. 1.75 to 2.25	$20.00
N'th'n No. 1 fdy., sil. 2.25 to 2.75	20.50
Malleable, not over 2.25 sil	20.00
High phosphorus	20.00
Lake Super. charcoal, sil. 1.50	27.04
So'th'n No. 2 fdy. (all rail)	$19.01 to 19.51
Low phos., sil. 1 to 2, copper free	29.50
Silvery, sil. 8 per cent	$28.79 to 29.79
Bess. ferrosilicon, 14-15 per cent	46.29

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Cast Iron Pipe.—New orders for cast iron pipe are confined to a few scattered tonnages in nearby towns. Municipalities find little need for this commodity at this time of the year, and private buying is of small proportions. Public utilities have completed their programs for this year, and it will be December or January before they make known their wants for 1930. October sales were a shade under the volume in September and smaller than in the tenth month a year ago. Prices remain steady and deliveries on most sizes are prompt.

Prices per net ton, deliv'd Chicago: Water pipe, 6-in. and over, $43.70 to $45.70; 4-in., $47.70 to $49.70; Class A and gas pipe, $3 extra.

Ferroalloys.—It is reported here that buyers of 50 per cent ferrosilicon will be offered 1930 contracts in the course of the next three weeks. No announcement has been made concerning next year's prices. New demand for other ferroalloys is dull.

Prices delivered Chicago: 80 per cent ferromanganese, $112.56; 50 per cent ferrosilicon, $83.50 to $88.50; spiegeleisen, 19 to 21 per cent, $39.76 to $41.76.

Structural Material.—Preliminary estimates of the need for steel for buildings to be constructed for the Chicago World's Fair are in excess of 50,000 tons. While there will be many structures of temporary type, it is planned to construct some buildings with the thought in mind that they can be put to practical use after the close of the fair. In addition to the steel needed for buildings, there will also be a large tonnage used in bulkheads and steel piling. Fresh inquiry and lettings of structural projects are light. Fabricators west of the Mississippi River have fair backlogs of highway bridge work, and similar new projects are taking shape. Indiana shops are in need of work, while local operations are spotty, with several shops in need of additional tonnage.

Mill prices on plain material, per lb.: 2.00c. to 2.05c. base, Chicago.

Plates.—Fully 30,000 tons of steel will be needed for new cars to be purchased by the Missouri Pacific. Steel needs for other car construction total more than 170,000 tons, including the tonnage for the recent Santa Fe orders. It is reported here that several sizable orders for tank plates have been placed with mills to the east of Chicago. Deliveries on plates are improved, as additional suspension orders reach the manufacturer of electrically welded pipe.

Bars.—Chicago bar mills continue to operate at 80 per cent of capacity and specifications fully match current shipments. Deliveries on mild steel bars are prompt on most sizes, and prices are steady at 2c. to 2.05c. a lb. Farm implement manufacturers are taking uniform quantities of steel, while, on the other hand, forgers' needs are spotty and small. Some improvement is noted in specifications for alloy steel bars. Consumption, however, is spotty and the small upturn in releases is not taken by the trade as an indication that demand is on the mend.

Cold-Finished Steel Bars.—Prices for this commodity have been marked down $2 a ton, effective Nov. 1. Specifications from sources other than automobile manufacturers are ample to support output at 75 per cent of capacity at local plants.

Bolts, Nuts and Rivets.—Demand from railroads, car shops and manufacturers of farm machinery shows further growth. Prices are holding.

Wire Products.—Specifications entered at mills by the manufacturing trade show some improvement, but the character of this business is spotty and is not taken by sellers as foretelling a continued increase in demand from this direction. Forward contracting also has gained ground, but it is pointed out that this business is not represented by fresh inquiries, but is largely resulting from the placing of business which has been before the trade for many weeks. Jobbers continue to take wire products at a steady rate. Some easing in demand is noted from the Northwest, where conditions were not generally so good from the point of view of crops as in other parts of the country. Orders for woven wire fencing are unusually large. This is accounted for in part by open fall weather, which is favorable for the repair and extension of fences. Most of the fencing shipments are from mill stocks, which were expanded through the summer and early fall. Reports from the trade, as well as the character of current orders, tend to confirm the view that

Warehouse Prices, f.o.b. Chicago

	Base per Lb.

Hot-pressed nuts, sq., tap. or blank	60
Hot-pressed nuts, hex., tap. or blank	60

No. 8 black ann'l'd wire, per 100 lb.	$3.45
Com. wire nails, base per keg	$2.75 to $2.95
Cement c't'd nails, base per keg	2.75 to 2.95

stocks in the hands of buyers are small. Jobbers are ordering at frequent intervals and in mixed lots, while manufacturers are taking wire at extremely close range in their efforts to hold stocks on hand to a minimum as the inventory season approaches. Stocks at mills are said to be normal for this time of the year. Prices are stable in a market which does not afford a real test of the situation.

Warehouse Business.—Recent sales of common and cement coated nails from warehouses establish prices in the range of $2.75 to $2.95, base, a keg. Quotations on other commodities are steady, and demand shows little change from the rate in the previous month. Judged by past performances, November is not expected by warehouses to measure up in volume of shipments to October, which often is the best month in the year. Several months in 1929 showed a surprisingly large movement of steel from warehouses, and it therefore has been no surprise that October this year has not stood out as has the same month in previous years.

Rails and Track Supplies.—The purchase of standard-section rails by the Missouri Pacific, which last week was named as a large Western railroad, is about 61,000 tons, rather than 40,000 tons, as previously reported. Fresh inquiry for 122,000 tons has come from the Southern Pacific. It is not clear in the minds of local sellers whether this tonnage covers the entire needs of this railroad and its subsidiaries or whether the needs of the latter will be sought at a later date. The Southern Pacific usually places separate tonnages for its affiliated companies. Local mills estimate that about 55 per cent of the fall buying of rails in Western territory has been completed. Releases against new contracts are only in such volume as to support rail mill output at 80 per cent of capacity. In fact, there are some indications that the railroads have revised their plans for releases this fall, and possibly shipments from now to the end of the year will not gain much. The track accessory market is quiet, but inquiries are taking shape for tonnages needed to go with recent rail purchases. The light rail market is dull.

Prices f.o.b. mill, per gross ton: Standard section open-hearth and Bess. rails, $43; light rails, rolled from billets, $36. *Per lb.:* Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.15c.; angle bars, 2.75c.

Old Material.—The price structure of the Chicago scrap market is breaking down under pressure of over supplies of many grades and the insistent efforts of sellers to place tonnages in a market which is wholly in the hands of consumers. Heavy melting steel is being purchased freely by brokers at $13.75 a gross ton, delivered, and consumers have refused offers of this grade at $14. One local steel mill is said to have a heavy stock, while another large buyer gives the same impression to dealers as he steadfastly refuses to accept shipments. Incoming tonnages are giving much trouble to dealers, and accumulations are growing in local scrap yards. The cast iron boring market is unusually dull. Sellers who name new low prices are surprised to find that consumers are completely without interest in the market and decline to make counter offers. Notable among price changes this week is a drop of $1.25 a ton for frogs, switches and miscellaneous rails and $2.50 a ton for iron arch bars and transoms.

Prices deliv'd Chicago district consumers:

Per Gross Ton

Basic Open-Hearth Grades:	
Heavy melting steel	$13.75 to $14.25
Shoveling steel	13.75 to 14.25
Frogs, switches and guards, cut apart, and misc. rails	14.50 to 15.00
Hydraul. compressed sheets	12.00 to 12.50
Drop forge flashings	10.75 to 11.25
No. 1 busheling	12.00 to 12.50
Forg'd cast and r'l'd steel carwheels	18.50 to 19.00
Railroad tires, charg. box size	18.00 to 18.50
Railroad leaf springs cut apart	18.50 to 19.00

Cupola Grades:	
No. 1 machinery cast	14.00 to 14.50
No. 1 railroad cast	13.00 to 13.50
No. 1 agricultural cast	12.25 to 12.75
Stove plates	12.25 to 12.75
Grate bars	11.75 to 12.25
Brake shoes	10.75 to 11.25

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

Sheets.—Prices for black and galvanized sheets are giving ground in this district. Black sheets are now quotable in the range of 2.85c. to 2.95c. a lb., Gary, and the galvanized product is bringing 3.60c. a lb., Gary, on the bulk of current business. Shipments of most grades from Western mills are little changed from a week ago, but recent releases are lighter and forecast a revision downward in the rate of operations from the 85 per cent of capacity mark. Many manufacturers are close to the period of inventory taking, and the character of their orders indicates not only that stocks on hand are small, but that they are paring down incoming supplies as closely as possible. Sellers, believing that stocks are close to the minimum, feel that the loss in specifications is a direct reflection of the general business situation. Local mills are beginning to accumulate stocks, which have been negligible for several months.

Base prices per lb., deliv'd from mill in Chicago: No. 24 black sheets, 2.85c. to 2.95c.; No. 24 galv., 3.65c.; No. 10 blue ann'l'd, 2.35c. Deliv'd prices at other Western points are equal to the freight from Gary, plus the mill prices, which are 5c. per 100 lb. lower than Chicago delivered prices.

Reinforcing Bars.—Buyers' interest in this market is confined almost wholly to a moderate tonnage composed of miscellaneous small orders. Most promising among fresh inquiries is the 500 tons needed for the Henrotan Hospital, Chicago. Among the more active projects is the steel for the buildings which will be erected by Illinois at various institutions scattered throughout the State. Prices show no improvement, as they rest at the lowest level so far this year. The rail steel commodity seems well established at 2c. a lb., but billet steel reinforcing bars are weak, when quotations are made on attractive tonnages. Bending shops remain active at a normal fall rate.

Commissioner Charles H. March of the Federal Trade Commission will preside at the solid-section steel-window trade practice conference, which has been scheduled for Nov. 18 at the Chamber of Commerce of the United States.

Large Tonnages of Steel in Chicago Building

THE Merchandise Mart of Chicago, now in course of construction, which will be the world's largest building, will require 60,000 tons of structural steel, including 61,000 columns, girders and beams; 142 miles of pipe for the sprinkler system; 32½ miles of pipe for the steam heating system; 40 miles of plumbing pipe; 9,504,000 sq. ft. of steel wire reinforcement for floors, enough for a 100-mile highway 18 ft. wide; 60 tons of wire for 30,000 lighting fixtures, besides many other materials in similarly large quantities, such as 29,000,000 bricks and 132,000 sq. ft. of glass. Contracts for material were let some time ago.

New York

Pig Iron and Steel Buyers Cautious, and Sales are Light—Structural Steel Activity Outstanding

NEW YORK, Nov. 4.—Aside from accentuating the hesitancy of buyers, who had been cautious for some time, the stock market collapse has had little effect on the pig iron market. No suspensions of shipments are reported; on the contrary, pressure for deliveries has increased in some cases where melters allowed their stocks to drop even lower than recent low levels. Pig iron consumption is well sustained, though sales for the week, at 7000 tons, were below normal. In fact, excluding 3000 tons bought by the Thatcher Co., Newark, N. J., they were exceedingly light. The A. P. Smith Mfg. Co., East Orange, N. J., has closed against its inquiry for 300 tons. Very little fresh tonnage has come before the trade. In general, the price situation is unchanged, with $17.50, Buffalo, and $18.50, eastern Pennsylvania furnace, available on No. 2 plain. At points close to seaboard, competition with Southern iron has become more of a factor, with the result that Northern producers have been forced to shade their quotations at times. A tonnage of Northern barge iron stocked at a New Jersey port was recently sold at $19, yard, to meet the Southern price of $19 to $19.50, on docks, New York harbor. Stocks of iron on Northern furnace banks are not excessive; in fact, at Buffalo they are reported to be below normal. Offerings of surplus steel company iron have not increased materially, notwithstanding the recent recession in steel production.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil. 1.75 to 2.25	$22.41 to $22.91
*Buf. No. 2, del'd east. N. J.	20.78 to 21.28
East. Pa. No. 2 fdy., sil. 1.75 to 2.25	19.89 to 21.02
East. Pa. No. 2X fdy., sil. 2.25 to 2.75	20.39 to 21.52

Freight rates: $4.91 from Buffalo, $1.39 to $2.52 from eastern Pennsylvania.

*Prices delivered to New Jersey cities having rate of $3.28 a ton from Buffalo.

Reinforcing Bars.—The Jones & Laughlin Steel Corporation will furnish 1300 tons of bars for the new building of the United States Rubber Co. in Passaic, N. J., for which the Turner Construction Co. has the general contract. Five hundred tons for the Rockaway Beach boardwalk will be supplied by Carroll & McCreary. An award of 1000 tons for the new assembly plant of the Ford Motor Co. at Edgewater, N. J., is expected in the immediate future. Prices are fairly steady at 2.05c., New York.

Finished Steel.—There has been a noticeable hesitancy on the part of buyers in the past week, who are apprehensive in regard to the industrial outlook because of the unsettled condition of the stock market and the disturbing effect of the recent break in stock prices. Specifications and orders have been only fair and have receded somewhat from the level of the previous week. The rather confused situation has contributed to the weakening of prices in some items. Cold-finished bars are down $2 a ton to 2.20c., Pittsburgh, and plates are being sold at 2.17½c. to 2.22½c., New York. The black sheet price remains fairly steady at 2.75c., Pittsburgh. In galvanized sheets, some business is being booked at 3.40c. and 3.45c., but considerable sales are reported at 3.50c., Pittsburgh. Blue annealed stock is firm at 2.10c., Pittsburgh, for No. 10 gage. In an otherwise colorless market, structural steel activities continue a feature. The leading Eastern producer declares that structural business in October "was substantially greater than the bookings of recent months." The October tonnage of fabricated awards in metropolitan New York, compiled by the Structural Steel Board of Trade, is expected to be close to that of August, which was one of the best months of the year.

Mill prices per lb., deliv'd New York: Soft steel bars, 2.24c. to 2.29c.; plates, 2.17½c. to 2.22½c.; structural shapes, 2.14½c.; bar iron, 2.14c.

Warehouse Business.—The past week has brought a slight improvement in the volume of buying from stock, especially in sheets. Prices, however, are still subject to concessions of $1 to $2 a ton on black and galvanized and as much as $5 a ton and more on blue annealed. Demand for structural material from stock continues fair, but tonnages are not so large as a few weeks ago.

Cast Iron Pipe.—Although this is usually a quiet season, sellers of pressure pipe report that buying is even smaller than normal for the fall. With election approaching, municipalities are not inclined to cover requirements until results are known, and private buyers have been less active than usual. It is suggested in some quarters that lower money rates and a better market for municipal bonds may result in the undertaking of needed improvements, including extensions of gas and water service. Both Northern and Southern producers of pipe have but little tonnage booked ahead, and prices are still rather irregular. The city of New York is asking for contractors' bids for furnishing and laying several hundred tons of pipe. About 200 tons of water pipe has been booked by a large Northern maker for export to the Dutch West Indies.

Prices per net ton deliv'd New York: Water pipe, 6-in. and larger, $34.60 to $36.60; 4-in. and 5-in., $37.60 to $39.60; 3-in., $44.60 to $46.60. Class A and gas pipe $3 extra.

Coke.—New Jersey and New England by-product coke producers have opened their books for the first half of 1930 and have renewed a large number of foundry coke contracts subject to prices ruling at time of delivery. New England requirements for

CARNEGIE LIBRARY

the first half are estimated at 150,000 tons. The stock market break has not affected coke specifications; in fact, shipments are showing their usual seasonal expansion. Standard furnace coke is unchanged at $2.75 a net ton, Connellsville, while beehive foundry grade ranges from $3.75 to $4.75, Connellsville. By-product foundry coke is quoted at $9 to $9.40 a net ton, Newark or Jersey City, and $10.06, New York or Brooklyn.

Old Material.—The larger consumers of scrap are still receiving sufficient tonnage on old contracts to satisfy their immediate needs and have not yet shown an inclination to cover their future requirements. Meanwhile, a substantial volume of material is available and brokers have reduced their buying price on No. 1 heavy melting steel to $15 a ton, delivered eastern Pennsylvania. Steel car axles are also off slightly and brokers have been able to buy recently at $21.25 a ton, delivered, on a $3.78 per ton freight rate to eastern Pennsylvania. Prices of other grades are unchanged, but lacking in strength.

Dealers' buying prices per gross ton, f.o.b. New York:

No. 1 heavy melting steel	$11.50 to $12.35
Heavy melting steel (yard)	8.00 to 9.50
No. 1 hvy. breakable cast	10.25 to 11.00
Stove plate (steel works)	8.00
Locomotive grate bars	8.25
Machine shop turnings	7.50 to 7.75
Short shoveling turnings	7.50 to 7.75
Cast borings (blast fur. or steel works)	7.00 to 7.75
Mixed borings and turnings	6.75 to 7.75
Steel car axles	17.50 to 18.00
Iron car axles	22.50 to 23.00
Iron and steel pipe (1 in. dia., not under 2 ft. long)	10.25
Forge fire	9.50 to 10.00
No. 1 railroad wrought	12.00 to 12.50
No. 1 yard wrought, long	11.00 to 11.50
Rails for rolling	12.75 to 13.25
Stove plate (foundry)	8.25 to 8.50
Malleable cast (railroad)	13.50 to 14.00
Cast borings (chemical)	9.50 to 10.00

Prices per gross ton, deliv'd local foundries:

No. 1 machry. cast	$16.00
No. 1 hvy. cast (columns, bldg. materials, etc.), cupola size	14.00
No. 2 cast (radiators, cast boilers, etc.)	13.50

Cleveland

Steel Consumers Ordering More Sparingly and Some Prospective Business Has Been Held Up—Output Curtailed

CLEVELAND, Nov. 4.—The steel market has been affected by the break in the stock market to the extent that consumers are ordering more sparingly than heretofore and the placing of some prospective business has been held up. As buying had already been greatly curtailed, the immediate effect of the decline in stocks probably was much less than it would have been had the steel market been more active. A feeling of hesitancy and caution has developed, which likely will have an influence on buying for some time.

A favorable factor of the situation is that steel prices have not suffered to any appreciable extent from conditions that developed during the week. There has been some further curtailment in this territory in open-hearth operations, which are down to about 75 per cent. Sheet and strip mill operations are spotty, the average by independent mills being 60 to 65 per cent.

There has been some further curtailment in the automotive industry, which is expected to move at a rather slow pace during the remainder of the year. However, the Ford Motor Co. continues to purchase steel in fair volume and the Chevrolet Motor Co. this week began to take shipments of body sheets for its new models, enabling some of the mills to increase operations.

Pig Iron.—Buying is limited to small lots for early shipment. Sales by Cleveland interests during the week aggregated 9500 tons, or about the same as during the previous week. Consumers are taking no interest in first quarter contracts and producers are making no effort to make sales for that delivery. November has started with a light volume of shipping orders. Producers do not look for much improvement in the demand from the automotive industry before December. Stove and radiator foundries are taking a fair amount of iron. Jobbing foundries are not doing so well as recently. Ohio foundries maintained 102 per cent of normal operations during September, as compared with 109 per cent in August and 90 per cent in September, last year, according to the monthly report of the Ohio Foundries Association, based on returns from 39 foundries. Prices are steady and unchanged at $18.50, Cleveland, for foundry and malleable iron for outside shipment and at $19, furnace, for local delivery and $19.50 to $20 for Michigan delivery.

Prices per gross ton at Cleveland:

N'th'n fdy., sil. 1.75 to 2.25	$19.50
S'th'n fdy., sil. 1.75 to 2.25	$20.50 to 21.00
Malleable	19.50
Ohio silvery, 8 per cent	28.00
Basic Valley furnace	18.50
Stand. low phos., Valley	26.50 to 27.00

Prices except on basic and low phosphorus are delivered Cleveland. Freight rates: 50c. from local furnaces; $3 from Jackson, Ohio; $6 from Birmingham.

Iron Ore.—Water shipments of Lake Superior ore up to Nov. 1 amounted to 61,253,954 gross tons, an increase of 11,534,023 tons over the total for the same period last year. Shipments during October were 7,989,127 tons, a decrease of 464,825 tons as compared with October last year. Bad weather interfered somewhat with the October movement. Shipments to Nov. 1 broke all previous records of water shipments for the season except in 1916 and 1917. The peak was reached in the former year with a water movement of 64,734,198 tons. Whether this record will be broken this year depends to a considerable extent on weather conditions this month. The November movement, according to present estimates, will be about 3,500,000 tons, and if that tonnage is moved, water shipments for the year will slightly exceed the former high record.

Semi-Finished Steel.—With curtailment of the demand, some producers would like to take on additional business, but inquiry is lacking. Specifications for sheet bars are fair, but slabs are moving slowly because of the light operations by the hot-rolled strip mills. The leading local producer is still operating 11 of its 14 open-hearth furnaces, with enough orders on its books to keep operating seven days. Prices are steady at $35, Cleveland and Youngstown, for sheet bars, billets and slabs.

Bars, Plates and Shapes.—Structural shapes continue in fair demand, being more active than steel bars and plates. However, plate inquiries have improved, being largely for tank work in lots up to 400 tons. The Cleveland water pipe inquiry requiring 3000 tons is still pending. Steel bar tonnage is fair except from the automotive industry. In the building field a 3300-ton award for an Akron department store has been made. Steel bars are unchanged at 1.90c., Cleveland. Shapes and plates range from 1.90c. to 1.95c., Pittsburgh, the lower price being named by some mills to large tonnage buyers.

Sheets.—New orders are scarce for all grades. Most consumers have fair stocks and are reducing their inventories. The aggregate tonnage coming from the automotive industry is light. Local plants making miscellaneous stampings are operating at about 55 per cent, while those making automobile stampings are running at not above 30 per cent of capacity. Business is slow with manufacturers of metal partitions and other building material. Weakness in blue annealed sheets has become more pronounced and quotations of 2.25c. for No. 13 and 2.10c. for No. 10 are more common. Some of the continuous mills are naming a 10c. per 100 lb. differential below the

Warehouse Prices, f.o.b. Cleveland

	Base per Lb.

No. 9 ann'l'd wire, per 100 lb	$2.65
No. 9 gal. wire, per 100 lb	3.00
Com. wire nails, base per keg	2.65

*Net base, including boxing and cutting to length.

regular quotations, and some of the jobbing mills are meeting this concession. Weakness has developed in galvanized sheets, which range from 3.40c. to 3.50c., Pittsburgh. Black sheets are firm at 2.75c.

Strip Steel.—Very little new business is coming out in either hot or cold-rolled strip. The automotive industry is ordering only in small lots for early needs. Regular quotations on hot-rolled material are being well maintained, although these have not been tested recently on round lots. Concessions to 2.65c., Cleveland, are reported on cold-rolled strip, but these are not common.

Wire Products.—The nail market has a firmer tone than recently. While sales are light, the $2.40 per keg price is being adhered to. Demand for wire continues dull, and the regular price is well maintained.

Cold-Finished Steel Bars.—A price reduction of $2 a ton to 2.20c., Cleveland and other basing points, is announced, effective Nov. 10. Fourth quarter contracts will be revised to the new price. Specifications continue light.

Old Material.—Activity is at a minimum because mills are taking very little scrap. Dealers are having difficulty in disposing of material they are anxious to move, and prices on some grades are weaker. One local mill is now taking no scrap of any grade, having cut off on blast furnace material during the week. Valley district mills have cut down on scrap shipments materially. Machine shop turnings have declined 25c. a ton. Short shoveling turnings are holding to recent quotations, one fair-sized lot having been sold during the week at $12. A small lot of low phosphorus forging crops brought $18. Cast scrap declined 50c. a ton. Heavy melting steel has been offered in the Valley district at $16.75.

Prices per gross ton delivered consumers' yards:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$14.50 to $15.00
No. 2 heavy melting steel	14.25 to 14.50
Compressed sheet steel	14.75 to 15.25
Light bundled sheet stampings	12.00 to 12.50
Drop forge flashings	13.00 to 13.25
Machine shop turnings	10.00 to 10.25
Short shoveling turnings	11.50 to 12.00
No. 1 railroad wrought	13.50 to 14.00
No. 2 railroad wrought	16.00 to 16.50
No. 1 busheling	13.25 to 13.75
Pipes and flues	9.00 to 9.50
Steel axle turnings	12.50 to 13.00
Acid Open-Hearth Grades:	
Low phos., forging crops	17.75 to 18.00
Low phos., billet, bloom and slab crops	18.50 to 18.75
Low phos., sheet bar crops	18.00 to 18.50
Low phos., plate scrap	18.00 to 18.50

Miscellaneous	
Railroad malleable	18.00 to 18.50
Rails for rolling	16.25 to 16.50

Philadelphia

Concessions of $1 On Plates—High-Finished Sheet Prices Lack Strength—Jobbers Reduce Sheets

PHILADELPHIA, Nov. 4.—Plate prices show a tendency to sag $1 a ton, but eastern Pennsylvania producers are still quoting 2.05c., Coatesville, with concessions for desirable business. Shape mills continue well engaged, but prices lack strength. Among the smaller buyers of iron and steel, a considerable degree of caution has developed as a result of the unsettled condition of the stock market, and there is a strong inclination to delay purchasing to determine what reaction, if any, has developed in their particular lines. Consumers of high-finished sheets report having received concessions in the usual extras charged for these grades. Jobbers in this district have reduced warehouse prices for black and galvanized sheets $4 a ton and cold-finished steel prices $2 a ton.

Pig Iron.—Shipments on contracts are going forward with few requests by consumers for delay, but buyers show no inclination to cover forward requirements. One local consumer of foundry iron, in the market for 1000 tons of foundry iron for more than two months, has been covering immediate needs by purchasing carload lots and expects to continue this policy for the remainder of the year. Eastern Pennsylvania furnaces quote $21, base furnace, for foundry iron, occasionally shading this price 50c. a ton on desirable orders.

Prices per gross ton at Philadelphia:

East. Pa. No. 2, 1.75 to 2.25 sil.	$21.26 to $21.76
East. Pa. No. 2X, 2.25 to 2.75 sil.	21.76 to 22.26
East. Pa. No. IX	22.26 to 22.76
Basic (del'd east. Pa.)	19.75 to 20.25
Gray forge	20.00 to 20.50
Malleable	21.25 to 21.75
Stand. low phos. (f.o.b. N. Y. State furnace)	22.00 to 23.00
Cop. br'g low phos. (f.o.b. furnace)	23.50 to 24.00
Va. No. 2 plain, 1.75 to 2.25 sil.	22.29
Va. No. 2X, 2.25 to 2.75 sil.	22.79

Prices, except as specified otherwise, are deliv'd Philadelphia. Freight rates: 76c. to $1.64 from eastern Pennsylvania furnaces; $4.54 from Virginia furnaces.

Bars.—Buying is limited to small lots and specifications against current contracts, which have been revised to 1.90c. a lb., Pittsburgh, or 2.22c., delivered Philadelphia.

Reinforcing Bars.—Projects involving substantial bar tonnages are pending award, including about 200 tons for the Farm Show Building, Harrisburg, Pa., and 400 tons for the Convention Hall, Philadelphia. A proposed hydroelectric development, including a $4,300,000 dam at Safe Harbor, Pa., will require a sizable tonnage of reinforcing bars. The general contractor is the Arundel Corporation, Baltimore. Prices are unchanged, with billet steel bars quoted at 1.95c. to 2c., Pittsburgh, or 2.27c. to 2.32c., delivered Philadelphia, and no extra for cutting to length. Rail steel bars range from 1.85c. to 1.95c., Franklin, Pa., and Tonawanda, N. Y., or 2.17c. to 2.27c., delivered Philadelphia, with no extra for cutting to length.

Shapes.—Fabricators are well engaged and in some instances have enough tonnage on their books to carry them through the winter. The Pottstown, Pa., fabricating shop of the McClintic-Marshall Co. made a record output of steel in October, with more than 20,000 tons shipped. Despite the good volume of business in the market, fabricators' quotations and prices of plain material lack strength. The market on shapes ranges from 1.90c. to 2c., f.o.b. nearest mill to consumer, or 1.96c. to 2.06c., delivered Philadelphia. Occasionally the lower price is shaded on desirable business.

Plates.—Desirable tonnages have recently brought out concessions of $1 a ton from 2.05c. a lb., Coatesville, Pa., but the old price is being maintained by eastern Pennsylvania mills on most of the current small business. Some substantial plate business is in prospect, including 5000 tons or more for locomotives for the Pennsylvania Railroad to be built by the Baldwin Locomotive Works and in the railroad's shops at Altoona, Pa., and about 12,000 tons each for two passenger vessels for the United States Lines, bids on which will be opened Nov. 15.

Sheets.—Local consumers of sheets are providing only a small volume of business, but prices are substantially unchanged. Black sheets are generally quoted at 2.75c., base Pittsburgh, or 3.07c., delivered Philadelphia, but buyers of high-finished sheets say they are able to obtain reductions in the usual extras. Galvanized sheets are quiet at 3.50c., Pittsburgh, or 3.82c., Philadelphia. Blue annealed sheets are quoted at 2.35c., Pitts-

Warehouse Prices, f.o.b. Philadelphia

	Base per Lb.
Plates, ¼-in. and heavier	2.70c.
Plates, ⅜-in.	2.90c.
Structural shapes	2.70c.
Soft steel bars, small shapes, iron bars (except bands)	2.80c.
Round-edge iron	3.50c.
Round-edge steel, iron finished 1½ x 1½ in.	3.50c.
Round-edge steel planished	4.30c.
Reinforc. steel bars, sq. twisted and deform.	2.60c. to 2.80c.
Cold-fin. steel, rounds and hex	3.50c.
Cold-fin. steel, sq. and flats	4.00c.
Steel hoops	3.55c.

*For 50 bundles or more; 10 to 49 bun., 4.10c. base; 1 to 9 bun., 4.35c. base.
†For 50 bundles or more; 10 to 49 bun., 4.95c. base; 1 to 9 bun., 5.30c. base.

burgh, or 2.67c., Philadelphia, for No. 13 gage and blue annealed plates, No. 10 gage are quoted at 2.20c., Pittsburgh, or 2.52c., delivered Philadelphia. To automotive and other preferred buyers, or when competition is encountered from the product of the continuous mill, concessions of about $2 a ton are offered.

Warehouse Business.—October buying was limited to small tonnages of material, but the total compared favorably with that of September, and in profits the month was one of the best of the year for certain jobbers. Effective Nov. 1, black and galvanized sheet prices were reduced $4 a ton to 3.90c. a lb., base, for black and 4.65c., base, for galvanized. On Nov. 2, cold-finished steel prices were reduced $2 a ton to 3.50c. a lb. for rounds and hexagons and 4c. for squares and flats.

Imports.—In the week ended Nov. 2, 615 tons of chrome ore arrived at this port from British South Africa and 76 tons of pig iron was received from Sweden. Steel arrivals consisted of 224 tons of structural shapes from Germany, 66 tons from Belgium and 11 tons from France, 45 tons of chrome steel rods from Sweden, 42 tons of steel bars from Belgium and 54 tons from Sweden, 4 tons of steel bands from Belgium, 48 tons of steel billets from Sweden, 17 tons of steel scrap from the United Kingdom and 4 tons from Germany.

Old Material.—Prices of all grades lack strength, but there have been no transactions of consequence with consumers to test the market. Mills are receiving heavy melting steel on old contracts and show no haste to cover future requirements. Machine shop turnings are off 50c. a ton to $11.50 a ton, delivered, and heavy breakable cast is not quotable at more than $14.50 a ton.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel	$15.50 to $16.00
Scrap T rails	15.00 to 15.50
No. 2 heavy melting steel	12.50 to 14.00
No. 1 railroad wrought	16.00 to 16.50
Bundled sheets (for steel works)	11.50
Hydraulic compressed, new	14.50 to 15.00
Hydraulic compressed, old	12.00 to 12.50
Machine shop turnings (for steel works)	11.50
Heavy axle turnings (or equiv.)	14.00 to 14.50
Cast borings (for steel works and roll. mill)	11.00 to 11.50
Heavy breakable cast (for steel works)	14.50
Railroad grate bars	12.00 to 12.50
Stove plate (for steel works)	12.00
No. 1 low phos., hvy., 0.04% and under	22.00 to 23.00
Couplers and knuckles	19.50 to 20.50
Rolled steel wheels	19.50 to 20.50
No. 1 blast f'nace scrap	10.50 to 11.00
Wrot. iron and soft steel pipes and tubes (new specific.)	14.50
Shafting	19.00 to 19.50
Steel axles	22.75 to 23.25
No. 1 forge fire	14.00
Cast iron carwheels	16.50
No. 1 cast	16.00 to 16.50
Cast borings (for chem. plant)	14.50
Steel rails for rolling	16.50 to 17.00

Railroad Equipment

Missouri Pacific Inquiring for 2304 Cars

INQUIRIES appeared the past week for 125 locomotives of which 30 are for the Missouri Pacific, 30 for the St. Louis-San Francisco, 40 for the Rock Island and 25 for the Wabash. The Missouri Pacific also is asking for bids on 2304 cars. Although car orders have been light, there are total outstanding inquiries for 14,000 freight cars, for which contracts are expected to be placed before the end of the year. Details of the week's business follow:

Missouri Pacific will buy five Mountain type locomotives, 25 freight locomotives, 1250 50-ton box cars, 1000 70-ton hopper cars, 10 all-steel parlor coaches, six dining parlor cars, three dining-club cars and 35 steel underframe caboose cars.

Chicago & North Western has ordered 100 underframes from American Car & Foundry Co.

St. Louis-San Francisco will buy 30 Mikado type locomotives.

Rock Island is in the market for 40 4-8-4 locomotives.

Wabash is asking for prices on 25 4-8-4 type locomotives.

Nashville, Chattanooga & St. Louis has ordered five 4-8-4 type locomotives from the American Locomotive. Co.

Newburgh & South Shore has placed an order for one six-wheel switching locomotive with the Baldwin Locomotive Works.

Baltimore & Ohio has ordered 50 passenger cars from the Pullman Car & Mfg. Corporation.

New York, Chicago & St. Louis has bought 10 caboose cars from the Canton Car Co.

Transcontinental Oil Co. is reported to have ordered 100 tank cars from the American Car & Foundry Co.

United Fruit Co. has ordered 100 banana cars and 80 superstructures from the Magor Car Corporation.

Pittsburgh Iron and Steel Market

(*Concluded from Page* 1264)

coal quotations are very low on the average.

Old Material.—A weaker tone is in evidence in the scrap market this week, but No. 1 heavy melting steel is not quotable at less than last weeks' range of $17 to $17.50. A tonnage of railroad steel bought this week by a mill in the district brought within a few cents of the higher figure, but weakness is still shown by the ability of dealers to pick up scrap against recent orders at as low as $16.50. A small sale of hydraulic compressed sheets brought about $17, and this commodity is probably stronger at $16.75 to $17.25 than heavy melting steel at the higher figures. The lighter grades are quoted at unchanged prices. Specialties are fairly strong, as shipments to steel foundries are keeping up and business on the books of these companies promises a good operation over the remainder of the year. One large steel company has held up shipments against all its scrap contracts, and others are taking steel only in limited tonnages. This position is justified in view of the continued downward trend of open-hearth operations.

Prices per gross ton delivered consumers yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$17.00 to $17.50
No. 2 heavy melting steel	15.00 to 15.50
Scrap rails	16.00 to 16.50
Compressed sheet steel	16.75 to 17.25
Bundled sheets, sides and ends	15.50 to 16.00
Cast iron carwheels	15.50 to 16.00
Sheet bar crops, ordinary	18.50 to 19.00
Heavy breakable cast	12.00 to 12.50
No. 2 railroad wrought	17.00 to 17.50
Hvy. steel axle turnings	16.00 to 16.50
Machine shop turnings	11.50 to 12.00
Acid Open-Hearth Grades:	
Railr. knuckles and couplers	20.50 to 21.00
Railr. coil and leaf springs	20.50 to 21.00
Rolled steel wheels	20.50 to 21.00
Low phos. billet and bloom ends	21.50 to 22.00
Low phos., mill plates	21.50 to 22.00
Low phos., light grades	20.50 to 21.50
Low phos., sheet bar crops	21.50 to 22.00
Heavy steel axle turnings	16.00 to 16.50
Electric Furnace Grades:	
Low phos., punchings	19.50 to 20.50
Hvy. steel axle turnings	16.00 to 16.50
Blast Furnace Grades:	
Short shoveling steel turnings	12.00 to 12.50
Short mixed borings and turnings	12.00 to 12.50
Cast iron borings	12.00 to 12.50
Rolling Mill Grades:	
Steel car axles	21.50 to 22.00
Cupola Grades:	
No. 1 cast	15.00 to 16.00
Rails 3 ft. and under	19.00 to 20.00

Production of Pig Iron and Steel in Canada

(a) High record production.

Beginning with January, 1930, the *National Waste Review* will be published monthly by the National Association of Waste Material Dealers, Times Building, New York. Beginning as a publication of about 60 pages, it will combine all the present publications of the association, including the Salvage and Reclamation Bulletin. The new publication will be available to members and non-members.

Pacific Coast

Pipe Line in Oregon Takes 2000 Tons of Plates—Structural Steel Market Continues Active

SAN FRANCISCO, Nov. 2 (*By Air Mail*).—Outstanding developments in the Pacific Coast iron and steel markets this week were the absorption by the United States Steel Corporation of the properties of the Columbia Steel Corporation, the award of 2000 tons of plates for a pipe line in Oregon, the placing of 800 tons of structural shapes for an office building addition in Los Angeles, and the letting of 1200 tons of reinforcing steel bars for a pulp plant addition at Camas, Wash.

Plans for the development of the Columbia properties by the Steel Corporation have not been announced, but it is said here that the Pittsburg, Cal., plant will be enlarged to twice its present capacity. Now that this deal has been consummated, more is heard on all sides regarding the possibility of the Pacific Coast Steel Co., with plants at Seattle, San Francisco and Los Angeles, selling out to an independent producer.

Pig Iron.—Demand for foundry pig iron has shown little sign of improvement. Upward of 2000 tons of Indian iron arrived recently. About two-thirds was taken by Los Angeles district melters and a third by San Francisco users. Prices are unchanged.

Prices per gross ton at San Francisco:

*Utah basic	$25.00 to $26.00
*Utah fdy., sil. 2.75 to 3.25	25.00 to 26.00
**Indian fdy., sil. 2.75 to 3.25	25.00 to 26.00

*Delivered San Francisco.
**Duty paid, f.o.b. cars San Francisco.

Bars.—Merchant bar steel demand remains quiet, with the majority of sales and inquiries involving small tonnages. Prices continue fairly firm at 2.35c., c.i.f., Coast ports. Important lettings included 1000 tons for a warehouse and 550 tons for a pier, both in San Francisco, and 1200 tons for a pulp plant addition for the Crown Willamette Paper Co., in Washington, all placed with the Pacific Coast Steel Co. A theater in Stockton, Cal., involving 150 tons, a nurses' home in Portland and a factory at St. Helens, Ore., the latter two involving 200 tons and 300 tons, respectively, were placed with the Truscon Steel Co. Pending business is of fair proportions, and new inquiries include 400 tons for a veterans' memorial at Yountville, Cal. No change in out-of-stock prices has occurred.

Plates.—Demand for plates has shown signs of improvement, and awards this week totaled more than 3000 tons. The Steel Tank & Pipe Co. took 2000 tons for a pipe line to be laid between Salem and Portland, Ore. The Willamette Iron & Steel Works booked 170 tons for a digester for the Crown Willamette Paper Co., Camas, Wash., and the Commercial Boiler Works secured 425 tons for five digesters for the Olympic Forest Products Co., Port Angeles, Wash.; 375 tons for drum gates and 550 tons for a penstock for the Lake Cushman dam project, Tacoma, Wash. No action has yet been taken on 1400 tons for the Everett, Wash., pipe line. Seattle is calling for bids on 370 tons for the Cedar River No. 2 pipe line. Prices are not firm at 2.35c., c.i.f.

Shapes. — Demand for structural steel shapes continues undiminished, and some fair-sized lots were placed during the week. The McClintic-Marshall Co. secured 335 tons for an apartment house in San Francisco; the Judson-Pacific Co. took 100 tons for a skating rink in Oakland, and the Consolidated Steel Corporation booked 800 tons for the California Bank addition, Los Angeles. Bids will soon be called for on 14,000 tons for the Lake Union bridge at Aurora Avenue, Seattle, and on 300 tons for an addition to the Southern Pacific Co.'s hospital in San Francisco. Plain material is firm at 2.35c., c.i.f.

Cast Iron Pipe.—Sales of cast iron pipe this week involved only two projects in excess of 100 tons. Los Angeles awarded P. P. Janich 100 tons of 4 to 10-in. Class B pipe for Olive Street, and San Diego placed 112 tons of 4 to 8-in. Class B pipe with the R. E. Hazard Contracting Co. for Estelle Street. The East Bay Municipal Utility District, Oakland, Cal., will open bids on Nov. 13 for 147 tons of 8 and 16-in. Class B and 150 pipe. The American Cast Iron Pipe Co. was low bidder on 261 tons of 6 and 8-in. Class B pipe for Burbank, Cal.

Steel Pipe.—Little of importance took place in the market for standard steel pipe, line pipe and oil country goods during the week. The Santa Fe Pipe & Supply Co. secured 243 tons of 1 to 8-in. black and galvanized steel pipe for Los Angeles.

Coke.—A shipment of 6000 tons of English beehive and by-product coke is due to arrive on the Coast about Jan. 5.

Warehouse Prices, f.o.b. San Francisco

	Base per Lb.
Plates and struc. shapes	3.30c.
Soft steel bars	3.30c.
Small angles, ⅞-in. and over	3.15c.
Small angles, under ⅞-in.	3.55c.
Small channels and tees, ¾-in. to 2½-in.	3.75c.
Spring steel, ¼-in. and thicker	5.00c.
Black sheets (No. 24)	4.90c.
Blue ann'l'd sheets (No. 10)	3.80c.
Galv. sheets (No. 24)	5.30c.
Struct. rivets, ½-in. and larger	5.65c.
Com. wire nails, base per keg	$3.40
Cement c't'd nails, 100 lb. keg	3.40

Canada

Spot Pig Iron Buying in Good Volume

TORONTO, Ont., Nov. 4.—Spot pig iron buying continues in good volume in the Canadian markets. Melters are taking in large shipments. Forward buying has virtually ceased, most melters who buy in this way being covered to the end of the year. There has been very little curtailment in the daily iron melt. Foundries are mostly running close to capacity. Local blast furnace representatives point out that business is about 10 per cent in excess of that done last year. Prices are firm.

Prices per gross ton:

Delivered Toronto	
No. 1 fdy., sil. 2.25 to 2.75	$23.60
No. 2 fdy., sil. 1.75 to 2.25	23.10
Malleable	23.60
Delivered Montreal	
No. 1 fdy., sil. 2.25 to 2.75	$25.00
No. 2 fdy., sil. 1.75 to 2.25	24.50
Malleable	25.00
Basic	23.50
Imported Iron, Montreal Warehouse	
Summerlee	$33.50
Carron	33.00

Structural Steel.—While the demand for building steel is on the decline, fabricators are still carrying large tonnages of unfilled orders, and all plants are running at capacity. Shipments on contract account are at a high average, and there is sufficient new business, in small tonnages, to maintain good shipments on spot account.

Old Material.—Mills continue to buy sparingly, with the result that the demand for steel grades is quiet both in the Toronto and Montreal markets. Iron grades have a steady call, but tonnages involved are smaller than those of a month or six weeks ago. Dealers are accumulating supplies against winter needs. Prices are unchanged.

Dealers' buying prices:

	Per Gross Ton	
	Toronto	Montreal
Heavy melting steel	$10.00	$8.50
Rails, scrap	11.00	9.00
No. 1 wrought	10.00	12.00
Machine shop turnings	7.50	5.00
Boiler plate	7.50	6.00
Heavy axle turnings	8.00	7.50
Cast borings	7.50	5.00
Steel borings	7.50	6.50
Wrought pipe	6.00	6.00
Steel axles	15.00	20.00

Stove plate	....	13.00
Standard carwheels	....	16.00
Malleable	....	13.00
	Per Net Ton	
No. 1 mach'ry cast	$16.00	....
Stove plate	12.00	....
Standard carwheels	15.00	....
Malleable scrap	14.00	....

Boston

Pig Iron Sales for Week Not More Than 3000 Tons—Scrap Buyers Staying Out of Market

BOSTON, Nov. 5.—With the gyrations of the stock market uppermost in the minds of most people, scant attention was given to pig iron the past week. Sales, most of them in car lots, in the aggregate did not exceed 3000 tons, and were fairly well divided among the Mystic Iron Works, Buffalo, and New York and Alabama stacks. It is more apparent that fairly recent sales by Alabama furnaces were sufficiently large to take care of some melters' requirements until Jan. 1 at least. It is now reported that the Rhode Island melter that bought 1000 tons of malleable iron paid less than the equivalent of $17 a ton, Buffalo.

Foundry iron prices per gross ton deliv'd to most New England points:

†Buffalo, sil. 1.75 to 2.25	$21.55 to $22.05
†Buffalo, sil. 2.25 to 2.75	22.05 to 22.55
*Buffalo, sil. 1.75 to 2.25	22.41 to 22.91
*Buffalo, sil. 2.25 to 2.75	22.91 to 23.41
East. Penn., sil. 1.75 to 2.25	22.65 to 23.15
East. Penn., sil. 2.25 to 2.75	23.15 to 23.65
Va., sil. 1.75 to 2.25	25.21
Va., sil. 2.25 to 2.75	25.71
*Ala., sil. 1.75 to 2.25	24.11
*Ala., sil. 2.25 to 2.75	24.61
†Ala., sil. 1.75 to 2.25	20.25
†Ala., sil. 2.25 to 2.75	20.75

Freight rates: $4.91 all rail from Buffalo, and $4.05 rail and water; $3.65 all rail from eastern Pennsylvania; $5.21 all rail from Virginia; $9.61 all rail from Alabama and $5.75 rail and water from Alabama to New England seaboard.
*All rail rate.
†Rail and water rate.

Cast Iron Pipe.—Current buying of pipe is largely private and in car lots. The Warren Foundry & Pipe Co. will furnish 150 tons of 6 and 8-in. pipe for a State job at Westfield, Mass., the largest individual order of the week. The Watertown Arsenal will close bids Nov. 7 on 100 tons of pipe and fittings. Indications are that welded steel pipe will be used for the Associated Gas & Electric Co.'s 25-mile line between Sherborn and Shrewsbury, Mass. Because of the sizable tonnages placed the past month in the New York territory, foundries are holding prices more firmly in New England. Prices quoted openly on domestic pipe are: 4-in., $44.10 to $45.10 a ton, delivered common Boston freight rate points; 6 to 12-in., $40.10 to $41.10; 16 to 20-in., $39.60. A $4 differential is asked on Class A and gas pipe. Imported pipe has not been much of a factor in this market of late.

Warehouse Business. — Following the recent cut of 20c. a keg in wire nail prices, the market has recovered 5c., making the stock price $3.25 a keg, base. In car lot shipments from mill the base price is $2.50 a keg, and less than car lots, $2.75. Staples and other wire products also have been advanced 5c. per 100 lb. Individual orders for iron and steel placed with warehouses continue small, but the weekly aggregate tonnage involved is representative. Prices remain more or less unsettled owing to keen competition for business.

Old Material.—The feature of the old material market the past week was the announcement that a steamer will start to load 3000 tons here Nov. 5, presumably for Danzig, and that between Nov. 15 and 20 another steamer will load 3000 to 3500 tons for Czechoslovakia. Pennsylvania steel mills are still staying out of the market, and owners of scrap are not interested in prevailing prices; consequently the market is more or less deadlocked.

Buying prices per gross ton, f.o.b. Boston rate shipping points:

No. 1 heavy melting steel	$10.75 to $11.25
Scrap T rails	10.50 to 10.75
Scrap girder rails	9.50 to 10.00
No 1 railroad wrought	10.50 to 11.00
No. 1 yard wrought	9.00 to 9.50
Machine shop turnings	6.50 to 7.00
Cast iron borings (steel works and rolling mill)	6.00 to 6.50
Bundled skeleton, long	9.00 to 9.50
Forge flashings	9.50 to 10.00
Blast furnace borings and turnings	6.00 to 6.25
Forge scrap	8.50 to 9.00
Shafting	14.00 to 14.25
Steel car axles	17.50 to 18.00
Wrought pipe 1 in. in diameter (over 2 ft. long)	9.00 to 9.50
Rails for rolling	12.00 to 12.50
Cast iron borings, chemical	9.50 to 9.75
Prices per gross ton deliv'd consumers' yards:	
Textile cast	$14.00 to $14.50
No. 1 machinery cast	15.00 to 15.25
No. 2 machinery cast	13.00 to 13.25
Stove plate	11.00 to 11.50
Railroad malleable	18.50 to 19.00

Birmingham

Steel Business Continues Fairly Good—21 of 23 Open-Hearths in District Active

BIRMINGHAM, Nov. 4.—The pig iron market has experienced another quiet week. Liberal orders for the fourth quarter, placed some weeks ago by many local consumers, have taken care of their probable requirements, so current sales are confined largely to foundries that usually buy on a hand-to-mouth basis. Inquiries are light. Furnace interests have given no indication as to when books will be opened for the first quarter. A further reduction in stocks was effected during October by the large shipments on previous sales to Eastern and Middle Western points. Quotations remain firm at $14.50. No change in furnace operations has occurred in the past three weeks. Of the 15 active furnaces, seven are on foundry iron, seven on basic and one on recarburizing iron.

Prices per gross ton, f.o.b. Birmingham dist. furnaces:

No. 2 fdy., 1.75 to 2.25 sil	$14.50
No. 1 fdy., 2.25 to 2.75 sil	15.00
Basic	14.50

Finished Steel.—There was a slight increase in backlogs during October despite the high rate of mill operations. Backlogs are sufficient to extend operations into December at the present rate without the addition of further tonnage. The present activity in bars, plates and structural shapes has been unequaled for some time. The sheet business is considered extra good for this time of the year. Specifications on contracts continue at a brisk rate. Tonnage on books of structural steel fabricators is the best in several weeks. New bookings of the Virginia Bridge & Iron Co. include 1400 tons for the Louisiana Steam Products power plant at Baton Rouge, La., and 860 tons for a passenger station for the Nashville, Chattanooga & St. Louis Railway Co. at Atlanta, Ga. Twenty-one of the 23 open hearths in the district are active.

Cast Iron Pipe.—Several good tonnages are up for awards, but buyers are slow in placing contracts. Tonnages for which bids were opened last week and other contracts still pending include 4000 tons for Dallas, Tex.; 2000 tons for Kansas City, Mo.; three miles of 8 to 12-in. pipe for Murfreesboro, Tenn., and small projects at Dayton and Jonesboro, Tenn. Inquiries have been received on two or three fair-sized projects for distant points. Backlogs were greatly reduced during October, and immediate tonnage is needed in some cases to support operations. Prices are unchanged from $37 to $38, base, for 6-in. and larger diameters.

Coke.—New business in the foundry coke market has been quiet for several weeks. Shipments on contracts are steady. Prices are unchanged.

Old Material.—There was a marked drop in the volume of new business

last week. This was felt mostly in the steel grades, as iron scrap was already inactive. There are no changes in quotations, the steel lines being fairly firm and iron very soft.

Prices per gross ton, deliv'd Birmingham dist. consumers' yards:

Heavy melting steel	$13.00 to $13.50
Scrap steel rails	14.00
Short shoveling turnings	9.00
Cast iron borings	9.00
Stove plate	11.50 to 12.00
Steel axles	21.00
Iron axles	23.00
No. 1 railroad wrought	10.00 to 10.50
Rails for rolling	15.50
No. 1 cast	13.00
Tramcar wheels	12.50
Cast iron carwheels	13.00 to 13.50
Cast iron borings, chem	13.50 to 14.00

Youngstown

Valley Mills on Lowest Schedules of Year

YOUNGSTOWN, Nov. 4.—For the first full week in November, operating schedules of Mahoning Valley steel companies are the lowest of the year, though losses in some directions are offset by gains in others. Tinplate schedules, for example, which declined to 60 per cent, have rebounded and are reported at 75 per cent. The Republic Iron & Steel Co. has started its tin mills at Leavittsburg, which have been idle. Steel bar output by the independents has gained to between 70 and 75 per cent, while 15 of 21 pipe mills are working. Tinplate buying for the first half of 1930 is expected to start in November.

The Carnegie Steel Co. has blown out No. 1 blast furnace in its Ohio Works group, leaving three of six in this complement in blast, and reducing the number of active furances in the Youngstown district to 25, of 35.

Of 51 independent open-hearth furnaces, 27 are scheduled, the smallest number in 15 months. Of 120 independent sheet mills, 79 are scheduled, and some of these only part time. The Sharon Steel Hoop Co. is again operating nine sheet mills, which have been idle, but losses in other directions produce a net loss for the district in sheet mill schedules.

The Republic Iron & Steel Co., because of business conditions, has deferred plans for installation of three additional sheet mills at its Warren works, to replace two jobbing units. The company now operates seven sheet mills at Warren and 18 at Niles. A number of sheet mills at the Warren plant have been converted into tin mills.

Average production for the district is not above 65 per cent.

Tonnage rates paid sheet and tin mill workers in Midwestern mills continue unchanged for November-December, as compared with the September-October rate, as a result of the bimonthly examination of sales sheets. The average selling price of Nos. 26, 27 and 28-gage black sheets shipped by subscribing mills for the 60 days ending Oct. 31, was disclosed at 3.05c. a lb., or unchanged from the preceding examination.

St. Louis

Missouri Pacific Orders 61,000 Tons of Rails—Scrap Buying Comes to a Standstill

ST. LOUIS, Nov. 4.—The past week was quiet in the pig iron market. The St. Louis Gas & Coke Corporation sold 1400 tons, including 1000 tons of malleable, to a local melter for first quarter delivery, and four 100-ton lots of foundry iron for prompt shipment, including 100 tons of special iron to a Nashville, Tenn., melter. Shipments by the local maker totaled 32,000 tons in October, about equal to September shipments. Southern iron sales for the week were between 1000 and 1200 tons, including three orders of 300 tons each. Books of Southern makers for first quarter have not been opened, but there is some talk of naming a base price of $14.50, Birmingham. Production by stove manufacturers is said to be about one-third greater than a year ago, plants here and at Belleville, Ill., working at full capacity. The implement trade also is said to be improving.

Prices per gross ton at St. Louis:

No. 2 fdy., sil. 1.75 to 2.25, f.o.b. Granite City, Ill.	$19.50 to $20.00
Malleable, f.o.b. Granite City	20.00
N'th'n No. 2 fdy., deliv'd St. Louis	22.16
Southern No. 2 fdy., deliv'd	16.92 to 18.92
Northern malleable, deliv'd	22.16
Northern basic, deliv'd	22.16

Freight rates: 75c. (average) Granite City to St. Louis; $2.16 from Chicago; $4.42 from Birmingham.

Rails.—The Missouri Pacific Railway has purchased 61,000 tons of 110-lb. and 90-lb. rails for 1930 use. It is understood that the tonnage was divided among the Illinois Steel Co., Colorado Fuel & Iron Co., Tennessee Coal, Iron and Railroad Co. and Inland Steel Co. on approximately an equal basis.

Finished Steel.—The Granite City Steel Co. reports that all units are operating at full capacity, and that enough business has been booked to operate the plate and galvanized sheet mills four weeks and blue annealed department about three weeks. The Laclede Steel Co. received the contract for 1700 tons of reinforcing bars for a building at Randolph Field, San Antonio, Tex., but there is no business of consequence pending locally for either reinforcing bars or structural steel.

Coke.—The demand for domestic coke is heavy, dealers buying more freely as their piles are reduced by demands resulting from colder weather. Industrial grades are in good demand.

Old Material.—Buying by consumers in the St. Louis district, which has been exceedingly light in the last few weeks, was brought to a stop early last week, purchasing agents reporting that they had been instructed to buy no more until the conditions in the stock market had become settled. Dealers also have been asked in some instances to withhold shipments against contracts, and cancellations have been received for most shipments due on expired contracts. Dealers are buying only against contracts. The amount of distress material is said to be small. Heavy melting steel is down 50c. a ton. Railroad lists: Pennsylvania, 53,360 tons; Baltimore & Ohio, 23,015 tons; Missouri-Kansas-Texas, 250 tons; Missouri Pacific, 122 carloads; Mobile & Ohio, 17 carloads; St. Louis Southwestern, 15 carloads.

Dealers' buying prices per gross ton, f.o.b. St. Louis district:

No. 1 heavy melting or shoveling steel	$13.00 to $13.50
No. 2 heavy melting or shoveling steel	12.50 to 13.00
No. 1 locomotive tires	15.00 to 15.50
Misc. stand.-sec. rails including frogs, switches and guards, cut apart	14.50 to 15.00
Railroad springs	16.50 to 17.00
Bundled sheets	10.00 to 10.50
No. 2 railroad wrought	13.50 to 14.00
No. 1 busheling	9.75 to 10.25
Cast iron borings and shoveling turnings	9.25 to 9.75
Iron rails	13.00 to 13.50
Rails for rolling	15.25 to 15.75
Machine shop turnings	7.25 to 7.75
Heavy turnings	9.50 to 10.00
Steel car axles	19.00 to 19.50
Iron car axles	27.00 to 27.50
Wrot. iron bars and trans.	21.50 to 22.00
No. 1 railroad wrought	13.00 to 13.50
Steel rails, less than 3 ft.	17.50 to 18.00
Steel angle bars	14.00 to 14.50
Cast iron carwheels	14.00 to 14.50
No. 1 machinery cast	15.25 to 15.75
Railroad malleable	14.50 to 15.00
No. 1 railroad cast	14.50 to 15.00
Stove plate	12.00 to 12.25
Agricult. malleable	14.00 to 14.50
Relay rails 60 lb. and under	20.50 to 23.50
Relay rails 70 lb. and over	26.50 to 29.00

Warehouse Prices, f.o.b. St. Louis

Less than 200 lb	50
Hot-pressed nuts, hex., blank or tapped, 200 lb. or more	60
Less than 200 lb	50

Hudson Valley Fuel Corporation is the name adopted for the former Hudson Valley Coke & Products Corporation, Troy, N. Y., which recently was purchased by the Niagara & Hudson Power Co. The Hudson Valley company owns a blast furnace and by-product coke ovens at Troy.

Buffalo

Southern Pig Iron Competition in East Affects New York State Furnaces—Scrap Market Dull

BUFFALO, Nov. 4.—The market for pig iron is very quiet. The largest order placed here during the past week was for 600 tons of foundry. Several lots of 100 tons each have been taken for district and Eastern delivery. Placing of Buffalo iron in the East has been somewhat disturbed by the competition of Southern furnaces, which have been quoting an equivalent of $16, Buffalo, and taking a good deal of the business that has been offered. One furnace lost in competition more than 10,000 tons to Southern furnaces in the past month. Most of the iron taken is for prompt shipment. First quarter books have not been opened, except that buyers have been told, in some instances, that they will be carried along for first quarter requirements. Shipments are remarkably good.

Prices per gross ton, f.o.b. furnace:

No. 2 fdy., sil. 1.75 to 2.25	$19.50
No. 2X fdy., sil. 2.25 to 2.75	20.00
No. 1 fdy., sil. 2.75 to 3.25	21.00
Malleable, sil. up to 2.25	20.00
Basic	$17.50 to 18.00
Lake Superior charcoal	27.28

Finished Steel.—Operation of Buffalo mills continues at last week's gait. The Lackawanna plant of the Bethlehem Steel Co. is operating 20 open-hearths and Donner Steel Co. is down to four. The Seneca Iron & Steel Co. is at approximately 70 per cent of capacity.

Old Material.—Buying has slackened to a minimum, although the market seems to have steadied and is no softer than a week ago. One of the large plants has practically suspended shipments, and this condition is now expected to prevail until Nov. 15. On shipments to another large plant, rejections are becoming very common. While mill operations have fallen off to some extent, stocks of scrap in dealers' yards are said to be only fair. A few sales of No. 1 machinery cast and rolled steel wheels have been made at the market. Production of scrap, due to lessened operation of automobile plants, has fallen off accordingly.

Warehouse Prices, f.o.b. Buffalo

	Base per Lb.
Plates and struc. shapes	3.40c.
Soft steel bars	3.30c.
Reinforcing bars	2.95c.
Cold-fin. flats, sq. and hex.	4.45c.
Rounds	3.95c.
Cold-rolled strip steel	5.85c.
Black sheets (No. 24)	4.20c.
Galv. sheets (No. 24)	4.85c.
Blue ann'l'd sheets (No. 10)	3.50c.
Com. wire nails, base per keg	$3.60
Black wire, base per 100 lb	3.75

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades:		
No. 1 heavy melting steel	$15.00 to	$16.00
No. 2 heavy melting steel	13.50 to	14.50
Scrap rails	15.00 to	15.50
Hydraul. comp. sheets	13.50 to	14.50
Hand bundled sheets	11.00 to	11.50
Drop forge flashings	13.75 to	14.00
No. 1 busheling	13.50 to	14.50
Hvy. steel axle turnings	13.50 to	14.00
Machine shop turnings	7.50 to	8.00
No. 1 railroad wrought	13.00 to	13.50
Acid Open-Hearth Grades:		
Knuckles and couplers	17.00 to	17.50
Coil and leaf springs	17.00 to	17.50
Rolled steel wheels	17.00 to	17.50
Low phos. billet and bloom ends	18.00 to	18.50
Electric Furnace Grades:		
Short shov. steel turnings	11.25 to	11.75
Blast Furnace Grades:		
Short mixed borings and turnings	11.25 to	11.75
Cast iron borings	11.25 to	11.75
No. 2 busheling	9.50 to	10.00
Rolling Mill Grades:		
Steel car axles	17.00 to	17.50
Iron axles	20.00 to	21.00
Cupola Grades:		
No. 1 machinery cast	15.00 to	15.50
Stove plate	12.50 to	12.75
Locomotive grate bars	11.00 to	11.50
Steel rails, 3 ft. and under	18.75 to	19.00
Cast iron carwheels	13.00 to	13.50
Malleable Grades:		
Industrial	17.50 to	18.00
Railroad	17.50 to	18.00
Agricultural	17.50 to	18.00
Special Grades:		
Chemical borings	12.50 to	13.50

Detroit

Further Recession in Automobile Output Over Remainder of the Year Is Expected

DETROIT, Nov. 4.—Whatever hopes the automobile industry may have entertained for a gradual recovery in the volume of motor car buying during the remainder of the year have been dissipated by the recent events in Wall Street.

Automobile manufacturers generally are revising production schedules downward to meet new sales conditions. Some motor car companies now have no definite schedules for this month and next, and are operating on a hand-to-mouth basis and cutting inventories to the bone. They anticipate a general reaction from the stock market collapse which will affect sales of new cars.

While there would have been some year-end shutdowns for inventory under any circumstances, the present situation is believed to have hastened such cessation of productive activities. A number of automobile manufacturers have temporarily shut down some units. This includes at least one body plant and some foundries.

The Ford Motor Co. schedule this week is 7600 motors per day for five days. The Chevrolet Motor Co., which had a schedule of 150,000 cars for November-December, is said to have cut this to about 50,000 for the two months. Steel and parts had been ordered for the original schedule, and suspension orders have been sent to the steel companies and parts manufacturer which were to have supplied the material.

The view of some sales executives of automobile companies is that sales of new cars over the remainder of the year will be at low ebb.

The Ford Motor Co. last week advertised a reduction in the prices of its cars, and at the same time lowered the discount to dealers from 20 per cent to 17½ per cent, the effect of which is that the dealers must absorb half of the reductions.

The low production schedules of automobile manufacturers have brought a corresponding decrease in the output of iron and steel scrap. The old material being released is no more than enough to cover current orders. Prices are unchanged, though the market is weak.

Dealers' buying prices per gross ton, f.o.b. cars, Detroit:

Hvy. melting and shov. steel	$13.75 to $14.25
Borings and short turnings	8.25 to 8.75
Long turnings	8.00 to 8.50
No. 1 machinery cast	12.50 to 13.00
Automobile cast	13.00 to 13.50
Hydraul. comp. sheets	13.75 to 14.25
Stove plate	9.00 to 9.50
New No. 1 busheling	11.75 to 12.25
Old No. 1 busheling	10.25 to 10.75
Sheet clippings	8.00 to 8.50
Flashings	12.25 to 12.75

Great Lakes Steel Orders Electrical Equipment

The Great Lakes Steel Corporation, Detroit, now a part of the National Steel Corporation, has placed orders for the greater part of the electrical equipment for its new steel plant. The General Electric Co. will supply for the drive for the 20-in. mill three 5000-kw., 600-volt motor generator sets, one 1200, one 1600, one 2200, one 3000 and six 2000 hp. motors with necessary control equipment, and for the 14-in. mill one 5000-kw. motor generator set, four 1000, two 2000 and one 1600 hp. motors with control equipment. This company will also furnish two 2000 hp. d.c. motors, a.c. general purpose motors and small mill type motors. The Westinghouse Electric & Mfg. Co. will furnish a 7000-hp. reversing motor for the blooming mill, two 2000-kw., 250-volt d.c. motor generator sets, one 2000 kva. transformer and a 4000 and 5000 hp. synchronous motor. Direct current motors for general purposes will be supplied by the Reliance Electric & Mfg. Co. The Cutler-Hammer Co. will supply the control equipment for the cranes.

International Acetylene Association, in its meeting scheduled for Nov. 13 to 15 at Congress Hotel, Chicago, will listen to series of papers on aircraft construction, cutting and welding of structural steel, welded piping, and testing of welds.

Cincinnati

Pig Iron, Coke and Scrap Quiet—Marked Slackening in Demand from Automobile Foundries

CINCINNATI, Nov. 4.—The district pig iron market is quiet and featureless. Sales during the last week about equaled those of the preceding week, approximately 2500 tons being the total reported. While this tonnage is not unusually small for the middle of the quarter, the fact that district consumers did not buy in the usual quantities at the opening of the quarter is causing concern to furnace representatives. A marked slackening in the demand from automobile foundries is noted, while on the other hand jobbing foundries are taking iron at about the usual rate, but they are not anticipating their requirements for any length of time. The largest order last week was for 600 tons of Northern foundry iron from a central Indiana consumer, while the remainder of the week's business was in small lots. Price schedules are steady, with Northern iron at about $18.50, base Lake furnace, and Southern iron at $14 to $14.50, base Birmingham. Inquiry is small.

Prices per gross ton, deliv'd Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25	$19.89 to $20.39
Ala. fdy., sil. 1.75 to 2.25	17.69 to 18.19
Ala. fdy., sil. 2.25 to 2.75	18.19 to 18.69
Tenn. fdy., sil. 1.75 to 2.25	17.69 to 18.19
S'th'n Ohio silvery, 8 per cent	26.89

Freight rates, $1.89 from Ironton and Jackson, Ohio; $3.69 from Birmingham.

Finished Material.—Current orders for sheets are almost entirely for immediate needs. The nearness of inventory periods is causing buyers to hesitate in anticipating their needs for any length of time. The demand for galvanized sheets is still good, but mill operators express dissatisfaction with the price situation, current schedules not being high enough to insure good profit in competitive markets where concessions are imperative to obtain business. Backlogs are shrinking daily and deliveries are almost immediate.

Coke.—The coke market reflects the same situation as the pig iron market. Specifications for by-product foundry coke from automobile foundries are noticeably off, while specifications from other consumers are being sustained at a fair rate. With virtually all consumers under contract for the remainder of the year, new business is light.

Old Material.—While there is virtually no activity in the scrap iron and steel market, price schedules have not changed in the last week. While there is no superabundance of steel scrap, the light grades are in better supply than the heavy grades. Dealers are buying carefully and are not accumulating stock. Consumers, too, are taking scrap only as it is needed.

Dealers' buying prices per gross ton, f.o.b. cars, Cincinnati:

Heavy melting steel	$13.00 to $13.50
Scrap rails for melting	14.00 to 14.50
Loose sheet clippings	8.50 to 9.00
Bundled sheets	10.75 to 11.25
Cast iron borings	8.75 to 9.25
Machine shop turnings	8.00 to 8.50
No. 1 busheling	10.50 to 11.00
No. 2 busheling	7.00 to 7.50
Rails for rolling	14.25 to 14.75
No. 1 locomotive tires	14.25 to 14.75
No. 2 railroad wrought	13.00 to 13.50
Short rails	18.50 to 19.00
Cast iron carwheels	12.50 to 13.00
No. 1 machinery cast	18.75 to 19.25
No. 1 railroad cast	15.00 to 15.50
Burnt cast	10.25 to 10.75
Stove plate	10.25 to 10.75
Brake shoes	10.00 to 10.50
Agricultural malleable	14.00 to 14.50
Railroad malleable	15.00 to 15.50

Warehouse Prices, f.o.b. Cincinnati

	Base per Lb.
Plates and struc. shapes	3.40c.
Bars, soft steel or iron	3.30c.
New billet reinforc. bars	3.15c.
Rail steel reinforc. bars	3.00c.
Hoops	4.05c.
Bands	3.50c.
Cold-fin. rounds and hex	3.85c.
Squares	4.35c.

4-in.	34.50
Seamless steel boiler tubes, 2-in.	17.50
4-in.	36.00

To Investigate Working Week in Industry

Census to Disclose Number of Days in Normal Plant Week; Also Industrial Migration

WASHINGTON, Nov. 5.—Marking the first time such information has been sought, the Census of Manufacturers to be taken early in 1930 will require manufacturers to state their practice with respect to the number of days that constitute the normal working week of their plants. There has been much speculation during the past two or three years on this subject and the advisory committee on the Census of Manufactures, headed by Col. L. S. Horner, president, Niles-Bement-Pond Co., New York, has announced its purpose to obtain exact facts of a nation-wide scope.

Manufacturers will be asked not only to state whether their plants are on a six, five-and-one-half or a five-day basis per week but also to indicate the number of shifts per day and hours of labor per week. There will be the usual questions on the number of wage earners and salaried persons, the seasonal variations of employment in lines of manufacturing that can be measured and on the growing use of power and power equipment.

As has been previously announced, migration of industry will be the subject of an inquiry that will be made for the first time. Movements of manufacturing that have been under way during the past decade have resulted in decreases in the requirements for skilled labor in one section of the country accompanied by increases in requirements for the same type of labor in other parts of the country. Again, a trend of manufacturing away from established centers and from the large cities has been reported. Such a diffusion of manufacturing, it was pointed out, would have an influence on the employment conditions surrounding industry. The purpose of the new census inquiry is to obtain reliable data on the subject.

The employment of women in industry again will be the subject of inquiry. While these data were available in the reports of previous decennial censuses, the employees in factories have not been divided according to sex since 1919 in the biennial censuses. Great changes other than geographical relocations have occurred in industry during the decade. Mechanization has brought about shifts in the character of workers required. It is desired to learn whether these changes have tended to increase or decrease the number of women in factories.

Blank forms for the forthcoming census will be distributed to the manufacturers early next year. The committee is interested in plans to bring about more expenditious and accurate completion of the schedules by manufacturers and prompt tabulation and publication of the data by the Bureau of Census. It therefore is seeking the cooperation of manufacturers.

Court Will Not Enjoin Interstate Steel Sale

Circuit Judge Philip L. Sullivan, at Chicago, has refused to grant an injunction restraining the sale of the Interstate Iron & Steel Co. to the Central Alloy Steel Corporation. Benjamin M. Morris, an attorney, brought suit on the ground that the deal constituted a merger of a type forbidden under Illinois laws. Judge Sullivan ruled that the complainant did not produce evidence that the stock transfer constituted a merger. The attorney said he would appeal from this decision.

Non-Ferrous Metal Markets

Further Decline in Lead and Zinc—Tin at New Low Level Since 1923—Copper Unchanged

NEW YORK, Nov. 4.

Copper.—There has been some improvement in copper buying from abroad, but very little in domestic demand. Sales for export have improved the last week, orders today totaling more than 1000 tons. Domestic consumers are buying as little as they can, which is not much, because orders received by fabricators are not coming in rapidly. October was one of the poorest months in some time in actual sales, those for export being estimated at not over 30,000 tons, while those for domestic shipment were considerably below totals which have lately been regarded as normal. It is reported that there will be further curtailment of production at the mines, supplementing that which occurred some months ago. The only bright spot in the picture is the fact that the price of copper is steady and it is the only one of the major nonferrous metals which has not changed during the collapse of the stock market. Foreign consumers are now in a position where they will have to buy November metal. Domestic consumers are not covered for all of their November needs. They probably will not purchase much December metal until conditions are more settled. Electrolytic copper is quoted at 18c., delivered in the Connecticut Valley, and the official quotation of Copper Exporters, Inc., is still 18.30c., c.i.f., usual European ports. Lake copper is unchanged at 18c. to 18.12½c., delivered.

Copper Averages.—The average price of Lake copper for October, based on daily quotations in THE IRON AGE, is 18.12½c., delivered New York. The average price of electrolytic copper is 17.75c., refinery, or 18c., delivered in the Connecticut Valley.

Tin.—Buying has been very light, with only about 200 tons of spot Straits tin sold for the week ended Nov. 2, the smallest for any week in a long time; of this 150 tons was sold on Nov. 1. Neither consumers nor dealers are showing interest, and the market is closely following fluctuations in London. When the Bank of England on Oct. 31 reduced its rediscount rate, tin prices shot up over £4 per ton, and the New York market also was stronger. With the announcement of October statistics on Nov. 1, the London market fell more than £3 at

THE WEEK'S PRICES. CENTS PER POUND FOR EARLY DELIVERY

	Nov. 4	Nov. 2	Nov. 1	Oct. 31	Oct. 30

Rolled Products

List Prices, Per Lb., f.o.b. Mill

On Copper and Brass Products, Freight up to 75c. per 100 Lb. Allowed on Shipments of 500 Lb. or Over

Sheets—
- High brass ..... 23.25c.
- Copper, hot rolled ..... 26.75c.
- Zinc ..... 10.25c.
- Lead (full sheets) ... 11.00c. to 11.25c.

Seamless Tubes—
- High brass ..... 28.25c.
- Copper ..... 29.25c.

Rods—
- High brass ..... 21.25c.
- Naval brass ..... 24.00c.

Wire—
- Copper ..... 19.87½c.
- High brass ..... 23.75c.

Copper in Rolls ..... 26.75c.
Brazed Brass Tubing ..... 30.87½c.

Aluminum Products in Ton Lots

The carload freight rate is allowed to destinations east of Mississippi River and also to St. Louis on shipments to points west of that river.

- Sheets, 0 to 10 gage, 3 to 30 in. wide ..... 33.00c.
- Tubes, base ..... 42.00c.
- Machine rods ..... 34.00c.

Chicago Warehouse

(Prices Cover Trucking to Customers' Doors in City Limits)

	Base per Lb.
Sheets—	
High brass	23.25c.
Copper, hot rolled	27.75c.
Copper, cold rolled, 14 oz. and heavier	30.00c.
Zinc	10.75c.
Lead, wide	11.35c.
Seamless Tubes—	
Brass	28.25c.
Copper	29.25c.
Brass Rods	21.25c.
Brazed Brass Tubes	31.00c.

New York or Cleveland Warehouse

Delivered Prices, Base per Lb.

High brass	21.12½c. to 22.12½c.
Copper, hot rolled, base sizes	27.75c. to 28.75c.
Copper, cold rolled, 14 oz. and heavier, base sizes	30.00c. to 31.00c.
Seamless Tubes—	
Brass	26.00c. to 27.00c.
Copper	29.12½c. to 30.12½c.
Brass Rods	18.87½c. to 19.87½c.
Brazed Brass Tubes	29.12½c. to 30.12½c.

New York Warehouse

Delivered Prices, Base Per Lb.

- *Zinc sheets (No. 9), casks* ..... 10.75c. to 11.25c.
- *Zinc sheets, open* ..... 11.50c. to 12.00c.

Metals from New York Warehouse

Delivered Prices, Per Lb.

- Tin, Straits pig ..... 42.50c. to 43.50c.
- Tin, bar ..... 44.50c. to 45.50c.
- Copper, Lake ..... 19.50c.
- Copper, electrolytic ..... 19.25c.
- Copper, casting ..... 19.00c.
- Zinc, slab ..... 7.50c. to 8.00c.
- Lead, American pig ..... 7.25c. to 7.75c.
- Lead, bar ..... 9.25c. to 9.75c.
- Antimony, Asiatic ..... 10.50c. to 11.00c.
- Aluminum No. 1 ingots for remelting (guaranteed over 99% pure) ... 25.00c. to 26.00c.
- Alum. ingots, No. 12 alloy ..... 24.00c. to 25.00c.
- Babbitt metal, commercial grade ..... 25.00c. to 35.00c.
- Solder, ½ and ½ ..... 28.50c. to 29.00c.

Metals from Cleveland Warehouse

Delivered Prices, Per Lb.

- Tin, Straits pig ..... 45.75c.
- Tin, bar ..... 47.75c.
- Copper, Lake ..... 19.50c.
- Copper, electrolytic ..... 19.25c.
- Copper, casting ..... 18.75c.
- Zinc, slab ..... 8.00c. to 8.25c.
- Lead, American pig ..... 7.15c. to 7.35c.
- Lead, bar 9.25c
- Antimony, Asiatic ..... 16.00c.
- Babbitt metal, medium grade ..... 18.50c.
- Babbitt metal, high grade ..... 50.00c.
- Solder, ½ and ½ ..... 29.00c.

Old Metals, Per Lb., New York

Buying prices represent what large dealers are paying for miscellaneous lots from smaller accumulators and selling prices are those charged consumers after the metal has been properly prepared for their uses.

	Dealers' Buying Prices	Dealers' Selling Prices
Copper, hvy. crucible	15.00c.	16.25c.
Copper, hvy. and wire	14.50c.	16.00c.
Copper, light and bottoms	12.75c.	13.75c.
Brass, heavy	8.25c.	9.25c.
Brass, light	7.00c.	8.00c.
Hvy. machine composition	12.00c.	13.00c.
No. 1 yel. brass turnings	9.75c.	10.50c
No. 1 red brass or compos. turnings	11.25c.	12.25c.
Lead, heavy	5.50c.	6.00c.
Lead, tea	4.25c.	5.25c.
Zinc	3.50c.	4.00c.
Sheet aluminum	13.25c.	15.50c.
Cast aluminum	11.75c.	13.75c.

the opening, with another break of £3 per ton later in the day. The statistics show an estimated increase in the world's visible supply of 1022 tons. Straits shipments which were estimated at 10,000 tons, turned out to be only about 8000 tons. There was thus a large amount of tin carried over. Supplies in the East, plus the estimated production, totaled upward of 14,000 tons available for shipment. This situation was the real cause of the break in London. Sales of tin in the East have been heavy in the last five days, totaling 1575 tons from Oct. 30 to Nov. 4, inclusive. London prices today were low at £181 15s. for spot standard, £185 for future standard and £185 15s. for spot Straits. The Singapore price today was £187. All of these prices are about £3 a ton lower than those of a week ago. In a very dull market, spot Straits tin was quoted today at 40.12½c., New York, the lowest level since Aug. 24, 1923.

Lead.—Another reduction was made on Oct. 31 by the American Smelting & Refining Co. in its New York contract price from 6.75c. to 6.50c., New York. With the first reduction made a week ago, the total decline in three days has been $8 a ton, or from 6.90c. to 6.50c. The decline has been largely due to lower prices in London, which reflect increased output and poor demand. Buying here has naturally been very light and consumers are awaiting developments. The quotation of the leading producer at St. Louis is now 6.35c.

Zinc.—Owing to further declines in London, the quotation for prime Western zinc declined on Oct. 31 from 6.60c. to 6.50c., East St. Louis, or 6.85c., New York. Naturally, buyers continue very cautious, and the market is by no means active. Sales for November delivery have been light, but it is felt that some buying must materialize soon. Even hand-to-mouth buying should be larger than it is.

Antimony.—Some antimony was sold during the week by holders, who apparently had to sacrifice it at 8.37½c., New York, duty paid. This has slightly unsettled quotations, which are now 8.62½c. for spot and 8.75c. for futures.

Nickel.—Ingot nickel in wholesale lots is quoted at 35c. per lb., with shot nickel at 36c. and electrolytic nickel in cathodes at 35c.

Aluminum.—Virgin metal, 98 to 99 per cent pure, is quoted at the published price of 23.90c. a lb., delivered.

Non-Ferrous Metals at Chicago

CHICAGO, Nov. 4.—Prices for these commodities have fluctuated rapidly in the last week and quotations with the exception of copper are lower. Sales of both new and old metals are in small volume.

Prices per lb., in carload lots: Lake copper, 18.50c.; tin, 41.37½c.; lead, 6.45c.; zinc, 6.60c.; in less-than-carload lots, antimony, 9.50c. On old metals we quote copper wire, crucible shapes and copper clips, 14c.; copper bottoms, 11.50c.; red brass, 11.50c.; yellow brass, 8c.; lead pipe, 4.50c.; zinc, 3c.; pewter, No. 1, 24.50c.; tin foil, 24c.; block tin, 34c.; aluminum, 12.87½c.; all being dealers' prices for less-than-carload lots.

Fabricated Structural Steel

Lettings Amount to Only 22,500 Tons—Inquiries Include 14,000 Tons for Seattle Bridge

CONTRACTS placed for structural steel the past week totaled only 19,000 tons, as against 55,500 tons the previous week. The major portion of the tonnage will go into structures for industrial purposes. The largest award was 3300 tons for a department store at Akron, Ohio. Approximately 23,000 tons has been added to prospective business on which bids have been asked. Fourteen thousand tons is for a highway bridge at Seattle, Wash. Awards follow:

BOSTON, 146 tons, health unit, to New England Structural Co.

STATE OF CONNECTICUT, 400 tons, highway bridge, to American Bridge Co.

NEW YORK, 700 tons, bridge for New York Rapid Transit Commission on East Fourteenth Street, Brooklyn, to American Bridge Co.

NEW YORK, 900 tons, apartment house at Lexington Avenue and Eightieth Street, to Easton Structural Steel Co.

PHILADELPHIA, 1500 tons, building for Girard College, to Bethlehem Construction Co.

VIRGINIAN RAILWAY, 100 tons, car parts, to Virginia Bridge & Iron Co.

NASHVILLE, CHATTANOOGA & ST. LOUIS RAILROAD, 850 tons, bridge, to Virginia Bridge & Iron Co.

BATON ROUGE, LA., 1400 tons, power plant for Louisiana Steam Products, Inc., to Virginia Bridge & Iron Co.

ATLANTA, GA., 860 tons, Union station for Nashville, Chattanooga & St. Louis Railway Co., to Virginia Bridge & Iron Co.

AKRON, OHIO, 3300 tons, Polsky department store, to Berger Iron Works.

DETROIT, 1350 tons, plant for Kelsey Hayes Wheel Co., to Whitehead & Kales Co.

WHITING, IND., 150 tons, building for Standard Oil Co., to Vierling Steel Works.

HARRISBURG, PA., 1750 tons, Farm Show building, to Shoemaker Bridge Co.

NORTHERN PACIFIC, 1100 tons, bridge work, of which 250 tons was taken by McClintic-Marshall Co. and the remainder by an unnamed bidder.

ROCK ISLAND RAILROAD, 300 tons, truss span, to American Bridge Co.

CHICAGO, 900 tons, first section Lawson Memorial Y.M.C.A. building, to American Bridge Co.

CHICAGO, 1400 tons, Ruth Garage, to Gage Structural Steel Co.; previously reported to American Bridge Co.

OMAHA, NEB., 450 tons, steel for Union Station, to Omaha Steel Works; this is in addition to previous tonnages.

OMAHA, 350 tons, Thirteenth Street viaduct, to American Bridge Co.

LAMAR, COLO., 700 tons, highway bridge, to Minneapolis Moline Power Implement Co.

OAKLAND, CAL., 100 tons, skating rink on Grove Street, to Judson-Pacific Co.

SAN FRANCISCO, 335 tons, apartment building on Union Street, to McClintic-Marshall Co.

SALINAS, CAL., 109 tons, two bridges over San Lorenzo and Pancherico Creeks, to an unnamed bidder.

LOS ANGELES, 800 tons, California Bank building addition, to Consolidated Steel Corporation.

ST. HELENS, ORE., 475 tons, plant for Fir-Tex Insulating Board Co., to Truscon Steel Co.

PORTLAND, ORE., 2000 tons plates, pipe line between Portland and Salem, to Steel Tank & Pipe Co.

CAMAS, WASH., 170 tons plates, digester for Crown Willamette Paper Co., to Willamette Iron & Steel Works.

TACOMA, WASH., 375 tons plates, drum gates for Cushman Dam project, to Commercial Boiler Works.

TACOMA, 550 tons plates, penstock for Cushman Dam project, to Commercial Boiler Works.

PORT ANGELES, WASH., 425 tons plates, five digesters for Olympic Forest Products Co., to Commercial Boiler Works.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

WELLESLEY, MASS., 300 tons, college administration building.

GARDNER, MASS., 118 tons, theater.

BOSTON & MAINE RAILROAD, 500 tons, bridges.

NEW YORK CENTRAL RAILROAD, 200 tons, bridge at Nyack, N. Y.

NEW YORK, 2000 tons, apartment house at 201-209 East Seventy-eighth Street.

STATE OF PENNSYLVANIA, 200 tons, highway bridges.

PITTSBURGH, 500 tons, Falk Chemical Laboratory for University of Pittsburgh; Stone & Webster, Inc., general contractor.

PITTSBURGH, 290 tons, addition to Taylor Allderdice High School; Williams & Haas, general contractors.

TOLEDO, 650 tons, building for Electric Auto-Lite Co.; bids taken.

CLEVELAND, 300 tons, East Seventy-ninth Street bridge for Nickel Plate Railroad.

MAYWOOD, ILL., 400 tons, public school.

MADISON, WIS., 600 tons, mechanical engineering building for University of Wisconsin.

CHEYENNE, WYO., 1200 tons, highway bridge across Canadian River.

SAND SPRINGS, OKLA., 900 tons, highway bridge.

SEATTLE, 370 tons plates, Cedar River pipe line No. 2; bids Nov. 4.

SEATTLE, 14,000 tons, Lake Union bridge on Aurora Avenue; bids soon.

SAN FRANCISCO, 300 tons, addition to Southern Pacific Co. hospital; bids soon.

ALAMEDA, CAL., 175 tons, hangar; bids being taken.

Tramrail Company Conducts Sales Training Class

Saturday, Oct. 19, marked the close of the fifth annual sales training class for dealers and dealers' salesmen, held by the Cleveland Tramrail Division of the Cleveland Crane & Engineering Co., Wickliffe, Ohio. The class was given a week's instruction in the tramrail overhead method of lifting and conveying materials. The first two days were devoted to intensive instruction in the plant and office, supplemented by stereopticon slides of various tramrail installations. Two days were then spent in an inspection trip to industrial plants, where tramrail installations were seen under actual operating conditions. Then further instruction was given at the Cleveland Tramrail plant, followed by a banquet Friday evening. The sales training classes are in charge of A. F. Anjeskey, sales manager of the Tramrail Division.

Chicago-Milwaukee Rate Reduction is Opposed

WASHINGTON, Nov. 5.—Briefs for and against the proposed reduced rate of 8c. a 100-lb., 80,000-lb., minimum carload on iron and steel products from the Chicago switching district to the Milwaukee, Kenosha and Racine, Wis., districts have been filed with the Interstate Commerce Commission. The present rate is 9.50c., 36,000-lb., minimum carload. The carriers, which have filed the new schedules, now under suspension, declared that if the commission disapproved the 8c. rate large tonnages will move by water. They further contended that the rate has been shown to be remunerative.

A brief for the Green Bay Association of Commerce, the Northwest Engineering Corporation, Morley Murphy and other protestants in the Green Bay district declared that the proposed rate is less than a reasonable maximum, and that it would be unduly preferential of Milwaukee, Kenosha and Racine and unduly prejudicial to Green Bay and intermediate territory. The Green Bay brief said that the purpose of the railroads is to hold present steel tonnage, and that they had claimed that if the lower rate is not permitted to go into effect 20,000 tons will move annually by Lake Michigan from the Gary district to Milwaukee.

A brief for the East Side Manufacturers' Association, East St. Louis, Ill., and the Granite City Steel Co., Granite City, Ill., said that water competition such as to be a controlling influence in the reduction of the present rate has not been proved. If there is a possibility of the use of water transportation, the brief continued, the rail carriers are not justified in attempting to eliminate it. The reduced rate, it was contended, would bring about undue prejudice and unjust discrimination against shippers in the East St. Louis district and would be a severe departure from the rates approved in general steel case, affecting new rates throughout Official Classification territory. The products that would be affected by the reduced rate are structural material, plates, sheets and strip steel.

Inland Steel Earnings Gain in Third Quarter

The Inland Steel Co. reports a consolidated net income, after all charges, for the three months ended Sept. 30, of $3,158,967, equal to $2.63 a share on 1,200,000 shares of common stock. This compares with $3,126,909, or $2.60 a share, in the preceding quarter, and $2,089,439, or $1.74 a share, in the third quarter of 1928. Net income, after all charges, for the first nine months of this year totals $9,293,118, equal to $7.74 a share on the common stock. In the first nine months of 1928, this company earned $5.53 a share on the common stock. The directors have declared the regular quarterly dividends of 87½c. on the common stock and $1.75 a share on the preferred stock.

The Wheeling Steel Corporation, Wheeling, W. Va., had net profit in the quarter ended Sept. 30 of $1,775,382. Net earnings for the first nine months of the year amounted to $5,912,919 after depreciation and provision for taxes, as compared with $3,963,009 in the same period of 1928. The regular dividend of 1 per cent on common stock was declared.

By-Products Coke to Buy Three Furnace Companies

Stockholders of the By-Products Coke Corporation have voted an increase in the capitalization of the corporation from 800,000 shares to 2,500,000 shares. The proceeds from the sale of about 1,200,000 shares of stock will be used to acquire the Toledo Furnace Co., Toledo, Ohio, the Zenith Furnace Co., Duluth, Minn., and the Perry Iron Co., Erie, Pa. An interest in the ore properties of Pickands, Mather & Co. will also be purchased.

Hard Surfacing Alloy

An alloy welding rod for surfacing worn parts or new parts which must endure severe abrasion has been developed by the Oxweld Acetylene Co. It is called Hascrome and is a manganese-chromium-iron combination. It should be welded to a clean steel surface with an oxy-acetylene flame containing an excess of acetylene; the feathery cone indicating excess acetylene may be from half to fully as long as the inner cone of a truly neutral flame. Molten Hascrome absorbs carbon from this flame and its hardness is dependent upon the carbon absorbed and the rate of cooling. If quenched in water it is softer than if slowly cooled, in this being similar to other austenitic alloy steels developed for anti-corrosion and high-temperature uses.

Brinell Hardness of Hascrome

Fused with small excess of acetylene:	Brinell Hardness
Slowly cooled	250 to 300
Quenched	240 to 290
Heavy excess of acetylene:	
Slowly cooled	450 to 500
Quenched	350 to 450

The deposited metal has a tensile strength of about 40,000 lb. per sq. in., and can be forged hot but not machined when cold.

While the metal thus has a considerable degree of hardness, it is recommended primarily as an intermediate layer between steel and stellite. Frequently parts are worn so badly that the cost of sufficient stellite to bring the item back to shape is greater than that of a replacement part. In such an event, the less expensive Hascrome may be used for the bulk of the volume, finishing off with a relatively thin layer of the more durable stellite. It is said that the two are easily welded together, and that Hascrome has sufficient strength to prevent a mushrooming effect under impact.

The Central Alloy Steel Corporation, Massillon, Ohio, has placed in operation at its Canton plant a new electric induction reclaiming furnace for the reclaiming of stainless steel scrap.

COMING MEETINGS

NOVEMBER

Open-hearth Committee of American Institute of Mining and Metallurgical Engineers. Nov. 5 and 6. Annual meeting, Hotel Stevens, Chicago. Leo F. Reinartz, American Rolling Mill Co., Middletown, Ohio, chairman.

International Acetylene Association. Nov. 13 to 15. Annual meeting, Congress Hotel, Chicago. A. Cressy Morrison, 30 East Forty-second Street, New York, secretary.

American Institute of Steel Construction. Nov. 13 to 16. Annual meeting, Edgewater Gulf Hotel, Biloxi, Miss. Charles F. Abbott, 200 Madison Avenue, New York, executive director.

Foundry Equipment Manufacturers' Association. Nov. 19. Forty-eighth annual meeting, Hotel Van Curler, Schenectady, N. Y. H. W. Standart, Northern Engineering Works, Detroit, president.

National Founders' Association. Nov. 20 and 21. Annual meeting, Hotel Astor, New York. J. M. Taylor, 29 South LaSalle Street, Chicago, secretary.

DECEMBER

American Society of Mechanical Engineers. Dec. 2 to 6. Annual meeting, 29 West Thirty-ninth Street, New York. Calvin W. Rice, 29 West Thirty-ninth Street, New York, secretary.

National Exposition of Power and Mechanical Engineering. Dec. 2 to 7. Annual exposition, Grand Central Palace, New York. Charles F. Roth, Grand Central Palace, New York, manager.

PERSONAL

T. M. GIRDLER, who recently resigned from the presidency of the Jones & Laughlin Steel Corporation, has been elected a member of the advisory committee of Continental Shares, Inc., a steel stock holding company controlled by Otis & Co., Cleveland investment bankers.

—

H. B. SCOTT, manager of the tin plate sales division of the Wheeling Steel Corporation, Wheeling, W. Va., and N. C. REED, manager of the company's Detroit office, have been appointed assistant general managers of sales with headquarters at Wheeling. Here their work will be under the supervision of W. B. HIGGINS, vice-president in charge of sales, and J. L. NEUDOERFER, general manager of sales. W. M. HALL, now manager of the company's Boston office, has been transferred to Wheeling to succeed Mr. Scott as manager of tin plate sales. S. H. WATERS, now in the Boston office, will succeed Mr. Hall there as acting manager. H. B. MILLER, now in charge of the company's Cincinnati office, will succeed Mr. Reed at Detroit. Mr. Miller was in the Detroit office before going to Cincinnati, and he will be replaced at the latter city by H. E. SMITH, who is now manager of the St. Louis office. B. M. SHARPE, assistant manager at St. Louis, succeeds Mr. Smith. O. I. STRICKLAND, recently an assistant manager in the tubular sales division at Wheeling, has been appointed manager of that division.

—

HENRY M. KELLY, assistant general manager of the Youngstown district for the United Engineering & Foundry Co., Pittsburgh, has retired after almost 43 years of continuous service with the company. He entered the employ of Lloyd Booth & Co., Youngstown, when he was 19 years of age and continued with that organization after its acquisition by the United company. He has been succeeded by E. E. CROSS, who has been associated with the Carnegie Steel Co. ROBERT MCGHIE, foreman at the company's Youngstown plant, has also resigned.

—

BENNETT CHAPPLE, director of publicity, American Rolling Mill Co., Middletown, Ohio, addressed the ninth annual Cleveland Foreign Trade Conference, Nov. 1, on advertising to increase foreign sales. The meeting was held under the auspices of the Foreign Trade Committee of the Cleveland Chamber of Commerce.

—

PERCY W. LEE, Arthur Lee & Sons, Ltd., the Crown Steel & Wire Mills, Sheffield, England, has returned to England after a three weeks' visit to strip mills in the United States.

—

DR. P. J. GIANI, metallurgical engineer, Fried. Krupp, A. G., Essen, Germany, sailed from New York, Nov. 2, for Germany, following an extended sojourn in the United States, studying processes and markets largely in tool steels and forgings.

—

WALTER MICKELSON, factory manager of the Kempsmith Mfg. Co., Milwaukee, has been made manager of the Cleveland branch office, and is succeeded by H. L. LIVESEY, production manager. GERALD G. TOLLIGER, formerly superintendent of the Evinrude Motor Co.'s Milwaukee plant, has been made production manager.

—

GEORGE L. HISE, of the Central Tube Co., Ambridge, Pa., has been appointed superintendent of pipe mills of the Republic Iron & Steel Co. He succeeds JOHN BAXTER, who had been with the Republic company for 20 years and largely supervised construction of new pipe capacity installed since the World War.

—

WILLIAM L. WOODWARD has been elected vice-president of the Superior Steel Corporation, Pittsburgh. For several years he has been assistant to the president of the Eaton Axle & Spring Co., Cleveland, and previously was general manager of the Standard Welding Co., Cleveland. He was graduated from Massachusetts Institute of Technology in 1907.

—

S. S. BUCKLEY, formerly president of the Onondaga Steel Co., Syracuse, N. Y., has become associated with Ekstrand & Tholand, 1 East Forty-second Street, New York, to promote the sale of Swedish sponge iron.

—

J. J. MITCHELL, heretofore Cleveland sales manager of the Square D Co., Detroit, has been placed in charge of all of the company's panelboard sales, with headquarters in Detroit. M. W. PARMALEE succeeds him in Cleveland.

—

H. M. DAVISON, who has been manager of excavator sales of the Harnischfeger Sales Corporation in the Eastern territory, with headquarters in New York, has been made general sales manager of the company, with offices at Milwaukee.

—

W. C. HECKEROTH, for the past two years with the Fuel Efficiency Engineering Corporation, Birmingham, has been appointed Birmingham district sales agent of the Erie Iron Works, Erie, Pa.

—

ALBERT J. SAMS, of Chicago, has been appointed railroad sales representative for the Little Giant Co., Mankato, Minn., manufacturer of power hammers.

—

GEORGE H. FREERS, who has been assistant chief engineer of the Marmon Motor Car Co., Indianapolis, for the past five years, has been made chief engineer, succeeding THOMAS J. LITTE, JR., who has resigned.

—

D. O. REARDON has been appointed representative in Iowa, with headquarters in Des Moines, for the Wagner Electric Corporation, St. Louis.

—

BERNARD NAGELVOORT, formerly plant manager of the Murray Corporation of America, has joined the Rotor Air Tool Co., Cleveland, as sales engineer, with headquarters in Detroit.

—

SAMUEL L. HOYT, research laboratories of the General Electric Co., Schenectady, N. Y., was the guest of the Boston branch of the National Metal Trades Association on Nov. 6 at the Hotel Essex, Boston. He discussed carboloy, dealing with its physical properties, hardness, and uses.

—

ARTHUR J. SPEER, for 15 years industrial secretary of the National Council of the Young Men's Christian Association, has been made personnel director of the American Cast Iron Pipe Co., Birmingham.

—

W. C. SUTHERLAND, assistant to the president of the Pittsburgh Steel Co., Pittsburgh, has been elected a director. Before promotion to his present position last July, Mr. Sutherland was general superintendent of the company.

—

CHARLES M. SCHWAB, chairman of the board of the Bethlehem Steel Corporation, will deliver the principal address at the annual dinner of the Illinois Manufacturers Association, Dec. 10, at the Stevens Hotel, Chicago.

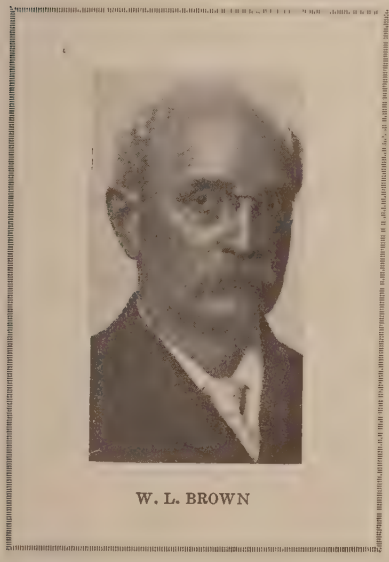
—

ALEXANDER CAMERON, assistant to F. H. GORDON, vice-president, Lukens Steel Co., Coatesville, Pa., has been placed in charge of the Philadelphia and New York offices of the company. F. L. SHANTS is assistant manager of sales in the Philadelphia office and HARRY LOEB continues in charge of the New York office. Mr. Cameron will make his headquarters in Philadelphia, but divide his time between the two offices. He joined the Lukens Steel Co. about three years ago, leaving the Michigan Steel Co. to become assistant to Mr. Gordon, who was at that time general manager of sales.

The eighth National Exposition of Power and Mechanical Engineering, known as the National Power Show, will be held in Grand Central Palace, New York, during the week of Dec. 2. The 420-odd booths already subscribed for will occupy approximately 130,000 sq. ft. of surface on three floors. Charles F. Roth and Fred W. Payne, Grand Central Palace, New York, are in charge.

OBITUARY

WILLIAM LISTON BROWN, formerly president of Pickands, Brown & Co., Chicago, died at his home in Pasadena, Cal., on Nov. 1, aged 87 years. He was born in St. Joseph, Mich. At the close of the Civil War, in which he served, he entered the pig iron and coal business as a clerk with A. B. Meeker & Co. and was made a partner



W. L. BROWN

in 1870. In 1883, he helped organize Pickands, Brown & Co. and seven years later, with others, formed the Chicago Shipbuilding Co., which was later merged with the American Shipbuilding Co. He was president of the latter until 1908. At one time he was chairman of the finance and executive committees of the Illinois Steel Co. He had also been president of the Federal Furnace Co. and director of the Lackawanna Steel Co. He retired from business about 10 years ago.

—

FRANK SALOMON, report of whose death in Munich has reached this country, was for years interested in the sale of American machine tools. Early in his career he was identified for 12 years with the Brown & Sharpe Mfg. Co. and then went to Europe as sales engineer for the Schuchardt & Schutte Co. and later with Alfred H. Schutte in Cologne. Subsequently he became president of the Otto Gas Engine Co., Philadelphia, but returned to Germany in 1914.

—

FRANK M. HAMILTON, president Thomas Hamilton's Son Co., Philadelphia, died on Oct. 12.

—

ROBERT EMMET JENNINGS, formerly a vice-president of the Crucible Steel Co., died at his home in Montclair, N. J., on Oct. 30, aged 84 years. As a young man he entered the steel business with Atha & Illingsworth, Newark, N. J., and after a few years left to establish Spaulding & Jennings, Jersey City, N. J. This company was purchased by the Crucible Steel Co. in 1900, of which he was vice-president until 1904. He was later appointed receiver of the Carpenter Steel Co., Reading, Pa., and after the reorganization he was elected president. In 1917 he was made chairman of the board, and retired a few years later.

—

ALEXANDER L. SCHUHL, manager of the Philadelphia office of the Independent Pneumatic Tool Co., Chicago, died of pneumonia on Oct. 20, aged 45 years.

—

JOHN WILLIAM LIEB, vice-president of the New York Edison Co. and a pioneer in the electrical field in this country, died at his home in New Rochelle, N. Y., Nov. 1, aged 69 years. He was born in Newark, N. J., and after his graduation from the Stevens Institute of Technology in 1880, he became identified with the Edison Electric Light Co., and assisted in making plans for the dynamos and equipment of the first central station for the distribution of electricity in New York. The following year he was sent to Milan in connection with the installation of electric light and power service in Italy, and while he was in Italy, Mr. Lieb began his study of Leonardo da Vinci, that made him a da Vinci authority.

—

HARRY I. ILLINGSWORTH, president, Boston Machine Works, Lynn, Mass., died on Oct. 31 at his home in that city, aged 63 years.

—

PETER A. NEWTON, general superintendent at the South works of the Illinois Steel Co., died suddenly soon after he entered his office on Nov. 4, aged 56 years. On his graduation from Cornell University in 1894 in mechanical engineering, he entered the service of the Illinois Steel Co. at the Joliet works, where he was steam engineer and assistant master mechanic until 1899. Then he was made assistant superintendent of the billet and rod mills and in 1901 was appointed assistant general superintendent of Joliet works. He was transferred to the South works in 1906 as assistant general superintendent and the following year was made general superintendent.

—

THERON I. CRANE died at his home in Philadelphia Nov. 2, aged 68 years. He was born in Indianapolis, but for most of his business career, or from 1880 to 1916, was identified with the pig iron trade of the East as a partner in Pilling & Crane, Philadelphia. In 1902, in association with W. S. PILLING, he organized the Northern Iron Co., which operated Northern furnace at Port Henry, N. Y., and later operated under lease the Standish furnace of the Delaware & Hudson Co. at Standish, N. Y. In 1906 Mr. Crane and others organized the Northern Ore Co., which for a time operated Keystone furnace at Island Park, Easton, Pa., formerly owned by the Thomas Iron Co. He was for a number of years a director of the Eastern Steel Co., Pottsville, Pa., and a director of the Bank of North America, Philadelphia.

Reinforcing Steel

Awards Total 9300 Tons and Inquiries 2700 Tons

REINFORCING steel lettings, at 9300 tons, include 1700 tons for barracks at San Antonio, Tex., 1300 tons for a rubber manufacturng plant at Passaic, N. J., and 1200 tons for an addition to a paper mill at Camas, Wash. Fresh inquiries amounted to 2700 tons. Awards follow:

HEMPSTEAD, N. Y., 250 tons, telephone building, to Carroll & McCreary.

NEW YORK, 125 tons, telephone building on Fiftieth Street, to Carroll & McCreary.

NEW YORK, 500 tons, board walk at Rockaway Beach, to Carroll & McCreary.

PASSAIC, N. J., 1300 tons, United States Rubber Co. building, to Jones & Laughlin Steel Corporation.

SPRINGFIELD, ILL., 1000 tons, State institutional buildings, to Inland Steel Co.

PITTSBURGH, 900 tons, McCann building, to Carlem Engineering Co.

SAN ANTONIO, TEX., 1700 tons, barracks at Randolph Field, to Laclede Steel Co.

CAMAS, WASH., 1200 tons, addition to Crown Willamette Paper Co. plant, to Pacific Coast Steel Co.

ST. HELENS, ORE., 300 tons, plant, Fir-Tex Insulating Board Co., to Truscon Steel Co.

PORTLAND, ORE., 200 tons, Nurses' Home, to Truscon Steel Co.

PORTLAND, 100 tons, addition Jantzen Knitting Mills, to Soule Steel Co.

SAN FRANCISCO, 1000 tons, warehouse for Pacific Gas & Electric Co., to Pacific Coast Steel Co.

SAN FRANCISCO, 550 tons, Pier No. 1, to Pacific Coast Steel Co.

STOCKTON, CAL., 150 tons, theater, to Truscon Steel Co.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

PROVIDENCE, R. I., 300 tons, Crawford Street bridge.

BROOKLYN, 300 tons, *New York Times* building.

ELMIRA, N. Y., 155 tons, new school.

PHILADELPHIA, 400 tons, Convention Hall; bids in.

ROCKFORD, ILL., 225 tons, factory for Mechanics Universal Joint Co.

SPRINGFIELD, ILL., 475 tons, State buildings; J. B. French & Co., general contractors.

CHICAGO, 500 tons, Henrotan Hospital.

YOUNTVILLE, CAL., 400 tons, Veterans' Home; bids Nov. 19.

SACRAMENTO, CAL., 147 tons, bridge over San Gabriel River; bids opened.

Recovery in Continental Steel Markets

Higher Prices Follow Reduction in Cartel Quotas—British Prices Firm Under Advancing Costs

(*By Cable*)

LONDON, ENGLAND, Nov. 4.

UNCERTAINTIES as to the Government's coal scheme have somewhat adversely affected the iron and steel business, but the decline in the bank rate has left consumers rather less anxious. Good pig iron inquiries are again circulating. Cleveland makers have sold moderately for November and their stocks are small, and being faced with a further increase in fuel costs, are holding prices firmly. Producers of hematite iron have already raised quotations 1s. following substantial sales for early next year.

Steel makers are meeting this week to discuss the 1930 program. It is regarded possible that official prices will be raised because of advanced costs, although opposition is strong in many quarters.

Business is generally quiet but good inquiries are looked for. Structural and metal-working plants are well occupied especially on domestic orders. Shipbuilders are slow to release tonnages to the mills, but new ship building is reported to be improving, so that the outlook in this direction seems healthy.

The International Raw Steel Cartel has proposed an immediate reduction of 10 per cent in output with the result that Continental makers are adopting a stiffer attitude and prices appear to have turned the corner. Business with Europe is dull except in semi-finished steel, but considerable quantities are arriving under old contracts.

Tin plates are steady in spite of weakness in tin. Makers are well supplied with orders so that there is no need to press for sales.

Consumers are in need of plates and good inquiries are expected, particularly as world consumption appears to be steadily increasing; certain it is that requirements of important users are now larger.

Demand for galvanized sheets has improved slightly and makers are less keen to accept lowest prices. Black sheets are quiet.

Clyde shipbuilding output in October was 20 vessels of 57,500 tons.

Nasmyth, Wilson & Co., Ltd., Manchester, has secured an order for six locomotives for the Kenya Uganda Railroad.

Quota Reductions Bring Higher Prices in Europe

(*By Radiogram*)

BERLIN, GERMANY, Nov. 4.

THE decree of the International Steel Cartel reducing production quotas of the member countries by 10 per cent has led to considerable recovery in the international market, with a sharp rise in prices.

Immediately before the decree, prices were the lowest since 1927. In the last few days prices of nearly all forms of steel, in particular bars, structural shapes and sheets, have advanced 1s. to 4s. a ton. Demand has increased and producers entirely dominate the market. Düsseldorf experts predict a further recovery and rise in prices. Domestic prices for November remain unchanged.

Steel Cartel Suggests Reduced Production

(*By Cable*)

PARIS, FRANCE, Nov. 1.

The executive committee of the International Steel Cartel, which is meeting here, has recommended that rolling schedules be reduced 10 per cent, effective Nov. 1, based on the present low prices and lack of buying in the steel markets.

British and Continental European Export Prices per gross ton, f.o.b. United Kingdom Ports, Hamburg and Antwerp, with the £ at $4.85

British Mills Need Tonnage

Steel Export Curtailed by Low Continental Prices—Some European Pig Iron Sold to British Users

LONDON, ENGLAND, Oct. 25.—Most steel mills are not particularly well situated with orders for the approach of the winter months. While blast furnaces are better engaged, many have but little business on their books for delivery beyond October. A desirable feature is that output is going directly into consumption and there is but little surplus iron for the open market.

Lack of business on the Continent has developed pressure by European mills for export tonnage, so that there has been some increase in foreign competition. Import of pig iron by British consumers, however, is not as a rule profitable, because of inland freight rates. In certain instances, however, basic iron has been sold to mills in Wales, and some French hematite is being shipped into the North of England, at the same time, it is difficult to sell Cleveland iron abroad at present prices, so that furnaces have been forced to rely on their domestic customers.

In semi-finished steel a certain proportion of business, particularly where a high grade steel is required, has been coming to British mills, but the renewal of severe Continental competition for billet and sheet-bar business has made it difficult for British works to secure even a fair share of this tonnage. Some good orders for foreign sheet bars have been placed by Welsh mills. British mills are unable to understand why the Continental makers should offer the drastic concessions in price that have been prevalent in the past few weeks. Sheet bars, for example, have declined about 7s. ($1.70) a ton in a month, and it is suggested that this may be the result of an effort to secure larger quotas in the International Steel Cartel.

Demand for finished material is light. Prior to the latest meeting of the Steel Makers' Association, considerable business was placed, particularly by the shipyards, in expectation of a rise in prices based on increased raw material costs. Specifications against these contracts are now being received and in a number of cases the steel mills are well occupied. Shipyards, however, are not receiving any large shipbuilding contracts, so that as these orders are completed there is but little to replace them. Various construction and electrical projects require a considerable tonnage of steel, but export trade is still restricted.

British consumers have the benefit of the steel makers' rebate plan, but on the Continent competition is difficult to meet. The tin plate trade is an exception, and a good tonnage has been shipped recently. World consumption of tin plate is increasing, but in the past few days, buyers have been deterred by the decline in the tin market. Most mills, however, are heavily engaged for some months.

According to *Lloyds Register*, vessels under construction in the United Kingdom at the end of September had decreased by about 5500 tons compared with June, although the total was more than 300,000 tons greater than in September, 1928. The total tonnage under construction was 1,448,000 tons. Abroad, 1,369,000 tons of shipping is being constructed, which is 15,000 tons less than in June. Tonnage laid down in the United Kingdom in the third quarter was 360,000 tons, a decrease of 68,000 tons and launchings totaled 370,000 tons. Abroad 300,000 tons of shipping was begun and 346,000 tons launched in the third quarter. A large part of the new contracting since the end of the third quarter has been in oil tank ships for Norway.

German Shipyards Seeking Tonnage

HAMBURG, GERMANY, Oct. 21.—At the end of September, German shipyards had a total of only 235,499 gross tons of shipping contracts compared with 406,982 tons in the first quarter of this year. New contracts have been limited and the shipyards are buying but little steel from the mills, so that plate and shape business is quieter.

Japanese Black Sheet Market Declines

Germany has developed into a close second to Great Britain in furnishing light gage black sheets to Japan, according to A. Cameron & Co., Kobe, Japan, in a report on Japanese market conditions for September. Of a total of 6420 tons of black sheets, arriving at Japanese ports of Kobe, Osaka and Yokohama in August, Great Britain furnished 2467 tons, Germony 2279 tons, the United States 1664 tons and Sweden 10 tons.

While there was some improvement in the Japanese black sheet market in September, a marked increase in the supply of sheets by the Kawasaki Dockyard Co. and other Japanese mills leaves rather large stocks on hand. Defective sheets, seconds and waste, offered by Japanese mills are promptly taken by consumers because of attractive prices, and there is an apparent increase in demand for sheet seconds from Japanese mills, buyers exhibiting less interest in defective sheets from abroad.

Recovery of the rate of exchange in the second half of September and reports that British sheets were being offered at £13 18s. 6d. ($67.80) per ton caused the market to sag toward the end of the month. A conference of the Kawasaki Dockyard Co. and accredited dealers in sheets has fixed the black sheet price for December delivery at 173 yen, based on £13 18s. ($67.68) per ton, a decline of 3 yen ($1.45) per ton. It is noteworthy that American black sheets are selling at about 1 sen (0.48c.) per sheet less than British. At the end of September British sheets were quoted at 65 sen (31.32c.) and American at 64 sen (30.84c.) per sheet.

Manganese Ore Prices Decline in Germany

HAMBURG, GERMANY, Oct. 21.—Manganese ore prices have registered a further decline and in the past week ore has been sold at 11¼d. (22½c.) per unit, c.i.f. German port. The lower grade Russian manganese ore from the Nikopol deposits in the Ukraine, which averages about 46 per cent manganese, has been sold at 10½d. (21c.) per unit, c.i.f. port.

Recently the South African manganese ore mines, controlled by the Manganese Ore Corporation, Ltd., at Postmasburg, have closed contracts for shipment of about 200 tons to France and more than 20,000 tons of ore to Germany, Belgium and Czechoslovakia. These sales are understood to have been on the basis of furnishing ore with 52 per cent Mn. and 0.15 per cent max. Phos.

Italy Inquires for Furnaces and Rolling Mills

HAMBURG, GERMANY, Oct. 21.—Recent Italian inquiries for steel mill equipment are sufficient to increase the output of the country by close to 200,000 tons a year. Inquiries include two blast furnaces, a number of open-hearth furnaces and considerable rolling mill equipment. German engineering companies bidding on this business expect orders to be placed soon.

EXPORTS OF AMERICAN ROCK DRILLS*

Destination	1925	1926	1927	1928
Union of South Africa	$184,979	$239,778	$310,937	$356,607

*From report prepared by Industrial Machinery Division, Department of Commerce.

Germany's Exports Gain 50 Per Cent in Three Years

Recording an increase of almost a billion dollars in the export trade of 1928 over that of 1927, at current money values, the fourth annual accounting of international trade, issued by the National Foreign Trade Council, shows a steady growth of the world's exports and a rate of annual increase slightly greater than that prevailing before the war. The advance in the world's foreign trade since 1925 is fully 15 per cent, or an average annual increase of 5 per cent. Between 1900 and 1913 the aggregate growth of the world's exports was about 63 per cent, or slightly less than 5 per cent a year.

The latest figures for 91 nations whose trade represents 95 per cent of current international commerce, place the world's 1928 exports at $32,914,000,000, equivalent to $23,567,000,000 at the 1913 value of the dollar. This compares with 1913 exports for these same nations of $20,055,000,000. They reached their pre-war level again for the first time in 1925 with exports of $20,454,000,000, increased to $21,025,000,000 in 1926 and to $22,867,000,000 in 1927. All the council's figures have been adjusted to the 1913 value of the dollar in order to provide a comparison free from factors of inflation.

The restoration of the world to its pre-war rate of progress in export growth is largely due to the export trade development since 1925 of three nations—Germany, the United States and Canada. Within the past three years Germany has outstripped all other nations in the advance of her exports. In 1925, they were valued at $1,414,000,000, reckoned at the 1913 valuation of the dollar. In 1928, they reached $2,093,000,000, a gain of $679,000,000, or almost 50 per cent. The increase of the United States in the past three years has also been notable, mounting from $3,147,000,000 in 1925, at the rate of the 1913 dollar, to $3,663,000,000 in 1928, a gain of $516,000,000, or about 17 per cent. Canada has increased her exports in this period by $162,000,000, from $819,000,000 to $981,000,000, or about 18 per cent.

The three nations whose total advances since 1913 are the greatest in amount are the same as were recorded last year—the United States, Canada and Japan. American exports increased between 1913 and 1928 by $1,179,000,000, or 48 per cent, at the 1913 valuation of the dollar; Canada's increased by $520,000,000, or 113 per cent, and Japan's by $341,000,000, or 109 per cent. Although our quantity gain was twice that of Canada and three times that of Japan, their advance at more than twice our own rate of growth is a fact that should not escape attention.

The most significant general increase in export trade during the year was that of the 12 nations of western Europe. The aggregate export of these nations for 1928 was $9,670,000,000. This was 98½ per cent of the export trade they carried on in 1913, using the strictly realistic comparison of the 1913 value of the dollar. Germany's rapid progress has brought her up to within 87 per cent of her 1913 real exports, Great Britain up to 95 per cent and Belgium up to 86 per cent. All the other nations of western Europe are doing more export trade than they did before the war with the exception of Holland, whose change of method in computing statistics makes exact comparison impossible.

Wabana Ore Shipments to Reach 1,800,000 Tons

WASHINGTON, Oct. 31.—Shipments of iron ore from mines in Newfoundland amounted to 1,001,849 gross tons during the current year up to Sept. 23, according to Consul A. M. Warren, St. John's. Germany was the largest purchaser of Bell Island ore, taking 483,669 tons, while 468,910 tons was shipped to Sydney, Nova Scotia, 43,940 tons to the United States and 5330 tons to Scotland.

It is estimated that before the end of the shipping season, which terminates on Dec. 20, unless Conception Bay is frozen before that time, 1,800,000 tons of ore will have been shipped if the current rate of production is maintained.

The British Empire Steel Corporation, which operates the Bell Island mines, has agreed to pay an export tax on ore sold abroad amounting to 10c. a ton, up to an annual total of 1,500,000 tons. Shipments in excess of this quantity are tax-free.

Accident Prevention Contest Conducted at Springfield

The Gilbert & Barker Mfg. Co., P. P. Kellogg Co., Van Norman Machine Tool Co., New England Box Co., Standard Electric Time Co. and Bay State Elevator Co. were winners of banners for September in the Springfield, Mass., industrial accident prevention contest. Sixty-seven firms are enrolled in this contest. In September 65 firms, employing 26,155 people, operated 4,846,796 hr. with an accident frequency of 18.98 per million hours worked and a severity rate of 0.40 per thousand hours worked. Figured at the rate of $4 per day, the employees of these plants suffered a loss of $7,848. In September there was a decrease of 15 in the number of lost time accidents, as compared with August, with a larger reduction in the number of days lost.

Bethlehem Expansion at Johnstown

The Bethlehem Steel Co. has announced a further expansion program calling for an expenditure of $10,000,000 at its Cambria works, Johnstown, Pa., according to an announcement by Eugene G. Grace, president of the company, while on an inspection tour of the Cambria plant. The improvements will be undertaken as soon as the present $12,000,000 betterment program at the plant is completed, and will center in the lower works departments. The program will include the installation of a new Bessemer department and new open-hearth furnaces.

Practical Use of X-Ray in Industry

An attractive booklet of 24 pages has recently been issued by the Kelley-Koett Mfg. Co., Inc., Covington, Ky., entitled "The Practical Use of the X-Ray in Industry." This company has had considerable experience in the examination of various metals and other materials with the X-ray, and the booklet gives some illustrations of the results and discusses the application of the X-ray to industry in general. The company also furnishes equipment for such work.

Desch Supply & Equipment Co., Baltimore, has been appointed sales representative in the State of Maryland and Washington, D. C., for Grefco chrome high-temperature cement and standard silica bonding cement made by the General Refractories Co., Philadelphia.

Production, Orders and Sales—Steel Castings and Power Equipment

	September, 1929	August, 1929	September, 1928

Welded Steel Fabric Made Available for Wider Use

Truscon welded steel fabric, which has been used to reinforce concrete highways for several years, has recently been made available in sizes and weights suitable for general reinforcing work.

The fabric comes with 4-in. mesh, the main wires and cross wires being welded by an electrical process that results in positive fusion of the two wires. The fabric is shipped in coils or sheets in weights up to 97 lb. per 100 sq. ft. It is expected that the new product will be used in the construction of docks, bridges, levees, floor slabs, reservoirs, driveways, sewers, subways, stadiums, viaducts, flues, grandstands, pipe, sidewalks and sea-walls.

A pamphlet put out by the Truscon Steel Co., Youngstown, Ohio, contains a general description of the product, with tables of standard types and sizes, properties of the wire used and sectionel areas of the fabric, allowable load capacities for floor slabs of various spans, a tentative schedule of specifications for reinforced concrete sewer pipe and tables for estimating weight per 100 sq. ft. of welded steel fabric.

American Papers at Testing Congress in Zurich

Statements concerning developments which have taken place in specific fields in each country are planned by the permanent committee for the International Congress for Testing Materials to be held in Zurich in 1931. From these a number of subjects for discussion at the congress will probably be selected. The statements for the United States have been secured by W. H. Fulweiler, the representative of the American Society for Testing Materials on the permanent committee, through the cooperation of a number of so-called "reporters," each one an authority in the particular field covered. The complete list of statements, up to the present time, is as follows:

Cast Iron: "Alloy Cast Iron and High Strength Cast Iron in the United States of America," by F. B. Coyle, International Nickel Co., Inc., New York; *Materials at High Temperatures:* "Alloys of Iron, Nickel and Chromium," by Marcus A. Grossman, Central Alloy Steel Corporation, Massillon, Ohio; *Welding:* "Compression of Welded and Riveted Joints," by F. P. McKibben, consulting engineer, General Electric Co., Black Gap, Pa.; *Progress in Metallography:* "Thermal Analysis and Dilatometry," by Howard Scott, Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa.; *"Non-Metallic Inclusions in Metals,"* by G. F. Comstock, Niagara Falls, N. Y.; *"Advances in Microscopy,"* by F. F. Lucas, Bell Telephone Laboratories, Inc., New York.

Ryerson Buys Camden, N. J., Steel Jobbing Company

Joseph T. Ryerson & Son, Inc., has purchased, effective Nov. 16, the business, equipment and stock of the Penn-Jersey Steel Co., Camden, N. J. The Penn-Jersey company warehouses in the Philadelphia district a complete stock of steel shapes, plates, sheets, hot and cold finished bars and reinforcing bars. Ryerson & Son plans to enlarge the stock at Camden, and to increase facilities of distribution.

Stock Offer Withdrawn

The Sharon Steel Hoop Co., Sharon, Pa., which recently offered its stockholders rights to subscribe for 90,000 shares of no par common stock of the company, has withdrawn that offer on account of recent developments in the security market. It is stated that the offer may be renewed when and if the directors feel that such action is for the best interest of the company and the stockholders, and when the general situation is more stabilized.

New Company Makes Gas-Fired Industrial Boilers

The Steam & Combustion Co., 205 West Wacker Drive, Chicago, has been incorporated for the production and sale of gas-fired boilers for industrial processing lines and kindred products. The company is owned and operated by the G. W. Dulany Trust, Chicago. G. W. Dulany, Jr., is chairman of the board; C. B. Page, president; William E. Eberhart, vice-president and treasurer, and James E. Moore, secretary and assistant treasurer.

The gas-fired boilers now being placed on the market are produced in association with the Freeman Mfg. Co., Racine, Wis., and the National Machine Works, Chicago. The former manufactures boilers and the latter specializes in gas combustion equipment. L. A. McDowell, a director of the new company, is president of the Freeman Mfg. Co., and W. R. Zitzowitz, also director, is president of the National Machine Works. Installations of the company's product have already been made in Chicago and plans are under way for introducing the line in other territories.

Electrical Equipment for Special Beam Mill Let

Electrical equipment for the main drive of a beam mill, to be installed at South works, Illinois Steel Co., Chicago, has been let to the Westinghouse Electric & Mfg. Co., East Pittsburgh. The mill will be used to produce a wide-flange section, which differs from the standard I-beam in that the flanges are of uniform thickness instead of being tapered, and the thickness of the metal in the flanges can be varied over a wide range. Due to its special features this section has come into heavy demand in building construction.

Special study has been given to this mill and several modifications have been made in the mill and electrical designs. An example of this is the two-motor, direct drive, for the blooming mill, which was described in THE IRON AGE of Oct. 31, page 1178.

Pittsburgh & West Virginia to Build Branch Line

The Pittsburgh & West Virginia Railway Co. has applied to the Interstate Commerce Commission for permission to construct a 6-mile branch line to connect Monessen and Donora, Pa., with the new Connellsville extension of that road now under construction.

The branch would connect the new extension at Charleroi, Pa., with the Donora Southern Railroad, a steel plant belt line. The Connellsville extension of the Pittsburgh & West Virginia extends from Cochran's Mills, Allegheny County, Pa., to Connellsville, where a connection is made with the Western Maryland and thence to tidewater at Baltimore.

Machinery Markets and News of the Works

October Tool Sales Large

Some Falling Off in Final Week—Effect of Stock Market Collapse Not Yet Gaged

MACHINE tool sales declined during the past week, although the totals for October are generally larger than those for the preceding month. To what extent the quieter business of the past week was caused by the widespread absorption in events in Wall Street cannot be estimated, but it is certain that routine business affairs in many quarters were neglected.

One of the largest machine tool distributers in the East reports that its October volume was the second largest for any month this year, and, when final footings are made, it may prove to have been the largest.

A falling off in machine tool demand during November and December would not be unusual in any circumstances, as such buying generally tapers off with the approach of the annual inventory season.

The automobile industry is not counted upon to supply its usual volume of machine tool orders for expansion and replacements, it being assumed that present equipment will suffice for a curtailed demand for passenger cars, at least until such time as the buying power of prospective car purchasers has become more definitely known.

Machine tool plants have large orders on their books, in many instances assuring present full production schedules through January and February. Deliveries on some tools extend into March. Since the experience of 1921, when wholesale cancellations of machine tool orders swamped the industry, sales of machine tools by virtually all factors in the industry have been non-cancellable, and such a clause appears in sales contracts.

The machine tool industry expects that the stock market collapse will be followed by a period of hesitation and watchful waiting, but it looks to the liquid and prosperous condition of industrial buyers as a bulwark for a continuing satisfactory volume of business.

New York

NEW YORK, Nov. 4.—Notwithstanding the fact that the attention of many people was riveted last week on the stock market, to the exclusion of routine business affairs, the volume of machine tool buying was fairly good. Some local sales offices report a falling off in the number of inquiries, and a few office experienced a somewhat quieter week in sales, but no special significance is attached at this time to this development. One of the largest machine tool distributers in the Eastern territory states that its October business will at least be the second largest for any month this year and, when final footings are made, it may take first place in total sales.

A noticeable feature of the current situation is widespread buying in New England. This comes from machinery companies catering to almost every line of industry. Even if machine buying should taper off during the remainder of the year, machine tool manufacturers would not feel the effects for some months, because nearly all leading tool builders are sold up through January, at least, and many have orders that will carry them through February and well into March. The only unfavorable development is that some orders for automobile parts have been temporarily held up.

F. L. Smith Machine Co., 633 West Forty-fourth Street, New York, has rejected bids recently received for extensions and improvements in five-story plant, to cost about $40,000, and will ask new bids soon. Russell G. Cory, 30 Church Street, is architect and engineer.

Prest-O-Lite Co., 30 East Forty-second Street, New York, manufacturer of acetylene gas, welding equipment, etc., has plans for a new branch plant at Casper, Wyo., to cost more than $75,000 with equipment. It is scheduled for completion early next year.

I. Kallich, 26 Court Street, Brooklyn, architect, has plans for a four-story automobile service, repair and garage building, to cost about $140,000 with equipment.

W. S. Barstow, Glendale, L. I., manufacturer of farm lighting equipment, heating apparatus, etc., has acquired plant of United Sash & Door Co., Glendale, on site 200 x 233 ft., and will improve for new plant.

Chevrolet Motor Co., 3044 West Grand Boulevard, Detroit, is contemplating early call for bids for one-story addition to assembling plant at Tarrytown, N. Y., to cost about $200,000 with equipment. Albert Kahn, Inc., Marquette Building, Detroit, is architect and engineer

Western Electric Co., 195 Broadway, New York, has purchased plants and business of Turner-Armour Corporation, Brooklyn and Queens, manufacturer of telephone booths and kindred telephone equipment. Properties consist of one-story plant, totaling 80,000 sq. ft. floor space at 6600 Metropolitan Avenue, Queens, and three-story factory at 1201 Flushing Avenue, Brooklyn, aggregating 60,000 sq. ft., used primarily for assembling operations, and will be operated in future as Queens Borough Works of Western Electric Co. New owner is said to be planning improvements and extensions.

Rubel Coal & Ice Corporation, 937 Fulton Street, Brooklyn, has plans for one-story ice-manufacturing plant, to cost about $100,000 with machinery. Henry J. Nurick, 44 Court Street, is architect.

Board of Education, Albany, N. Y., is considering installation of manual training equipment in new junior high school to cost more than $1,200,000, for which bids will soon be asked on general contract. A. L. Delehanty, 121 North Pearl Street, is architect.

Atlantic Basin Iron Works, Inc., 168 Van Brunt Street, Brooklyn, has engaged G. L. Slaight, 343 Columbia Street, architect, to prepare plans for rebuilding part of plant recently destroyed by fire; a new two-story shop will be built, to cost about $45,000 with equipment.

Sonatron Tube Co., 57-9 State Street, Newark, manufacturer of radio tubes and equipment, is having revised plans drawn for new six-story addition, 70 x 120 ft., to cost over $100,000 with equipment. Siegler & Greenberg, 164 Market Street, are architects.

Traveling ovens, power equipment, conveying machinery and other mechanical equipment will be installed in new four-story and basement plant, 170 x 200 ft., to be erected by National Biscuit Co., 85 Ninth Avenue, New York, at Newark, to cost $525,000 with equipment. General contract has been let to White Construction Co., 95 Madison Avenue, New York. Louis Wirsching, Jr., is company architect.

Juno Fasteners, Inc., 202 Penn Avenue, Hillside, N. J., manufacturer of radio tube parts and kindred equipment, has acquired former plant of J. M. Quimby Co., 24-34 Sterling Street, East Orange, N. J., for a new plant, and will remove to new location.

Eaton Kent Co., Academy Building, Newark, Coal-handling equipment and de-

vices, has leased one-story building at Harrison, N. J., for mechanical works, storage and distributing service.

New Jersey Art Foundry Co., 433 Tonnele Avenue, Jersey City, N. J., has awarded general contract to Frank Crahay, 3572 Hudson Boulevard, for one and two-story addition to foundry, to cost about $35,000 with equipment. Leo Feinen, 3697 Hudson Boulevard, is architect.

Spanjer Brothers, Inc., 198 Badger Avenue, Newark, manufacturer of signs and displays, is planning immediate rebuilding of part of plant destroyed by fire Oct. 29.

Francis P. Friedman, 395 Springfield Avenue, Newark, architect, is asking bids on general contract until Nov. 15 for a one-story automobile service, repair and garage building, 145 x 150 ft., at Passaic, N. J., to cost about $130,000 with equipment.

Oakley Valve & Foundry Co., 48 Ferguson Street, Newark, manufacturer of poppet valves for internal combustion engines, has been incorporated with capital stock of 5000 shares of no par value. Company's foundry work will consist chiefly of non-ferrous, nickel and monel metal castings. William E. Oakley is president.

McKiernan-Terry Drill Co., 15 Park Row, New York, has changed its name to McKiernan-Terry Corporation and has acquired ownership of National Hoisting Engine Co., Harrison, N. J., and Steele & Condict, Inc., Jersey City, N. J. Consolidation of these three companies whose products go into same fields has been effected to provide for business expansion. Work previously done at plant of Steele & Condict, Inc., will be divided between McKiernan-Terry plant at Dover, N. J., and National plant at Harrison. Arthur W. Buttenheim is president of McKiernan-Terry Corporation.

Buffalo

BUFFALO, Nov. 4.—International Business Machines Corporation, Endicott, N. Y., has plans for four-story addition, to cost more than $150,000 with equipment. C. H. Higgins, 101 Park Avenue, New York, is architect. Headquarters are at 50 Broad Street, New York.

Atlantic Refining Co., 260 South Broad Street, Philadelphia, has purchased oil storage and distributing plant and other properties of Empire State Oil Co., Binghamton, N. Y. Plans are under way for expansion in first noted unit, to cost about $100,000 with equipment.

Board of Education, Genesee Building, Buffalo, is considering installation of manual training equipment in new high school to cost over $1,350,000. D. G. McNeil, address noted, is architect for board.

American Locomotive Co., 30 Church Street, New York, has purchased plant and business of McIntosh & Seymour Corporation, Auburn, N. Y., manufacturer of Diesel engines. Plant will be continued under present name and operated as a subsidiary. Expansion is planned.

Irving Air Chute Co., 372 Pearl Street, Buffalo, has authorized immediate construction of new branch plant at Grand Central Air Terminal, Glendale, near Los Angeles, consisting of one-story unit for parts production and assembling, to cost about $100,000 including equipment.

The Crane Market

INQUIRY for overhead traveling cranes has decreased, but builders are well engaged on old orders and in most cases are quoting three to four months delivery. Following a delay caused by a threatened taxpayer's suit, contract of the Board of Transportation, New York, for six substations has been awarded to the General Electric Co., which has placed an order for six overhead cranes. The Standard Oil Co. of New Jersey, is asking prices on a small capacity hand power crane. Business in locomotive cranes is small in the East, but some fair orders have been placed in the Chicago district. Recent purchases have included: General Electric Co., Schenectady, N. Y., six 30-ton, 3-motor, overhead cranes for substations in New York for Board of Transportation, to Cleveland Crane & Engineering Co.; Sun Oil Co., Philadelphia, 15-ton crawl tread crane from unnamed builder.

New England

BOSTON, Nov. 4.—Platt Brothers & Co., Inc., Platts Mills, Waterbury, Conn., manufacturer of metals, metal stampings, aluminum products, etc., has plans for a one-story addition, 70x140 ft., to cost $40,000 with equipment. Fred A. Webster, Waterbury, is architect.

Buzzards Bay Gas Co., 1 State Street, Boston, is contemplating new artificial gas plant in Buzzards Bay district to cost about $550,000 with equipment. Cape Cod Gas Co., same address, an affiliated organization, has plans for a similar plant near Hyannis, to cost about $600,000 with machinery. S. B. Gallagher, 20 Hammatt Street, Ipswich, Mass., is engineer for projects.

Narragansett Electric Co., Providence, R. I., is arranging expansion over period of 36 months, in conjunction with similar program to be carried out by New England Power Association, Worcester, Mass., of which it is a subsidiary. Work will include extensions and betterments at South Street generating plant, extensions in underground conduit system and overhead lines, with installation of new equipment to cost $3,000,000; a new power substation will be built in East Providence district to cost $500,000, and number of smaller substations in different parts of city.

Scovill Mfg. Co., Waterbury, Conn., has awarded contract to Levering & Garrigues Co., 552 West Twenty-third Street, New York, for one-story addition to brass goods manufacturing plant, 62x391 ft., to cost more than $85,000 with equipment. Hugh L. Thompson, Waterbury, is architect.

William J. Hanna, Attleboro, Mass., manufacturer of cutlery, has started work on a one-story plant, 26x96 ft.

A. F. Robinson Boiler Works, Cambridge, Mass., has purchased local property, 100x200 ft., which will be developed for manufacturing purposes.

Providence Insulated Wire Co., Providence, R. I., is about to start work on a one and two-story, 24x100 ft., manufacturing plant and office addition.

H. E. Holbrook, Worcester, Mass., has started erection of a one-story foundry, to cost $12,000 without equipment.

Moore Drop Forge Co., Springfield, Mass., will build a one-story addition, 93x182 ft., to cost $35,000 without equipment.

Hemphill Co., Central Falls, R. I, manufacturer of hosiery machinery, has started work on a one-story addition, 60x200 ft.

Fairfield County Ice Co., Stamford, Conn., will build an ice manufacturing plant, 80x220 ft.

E. W. Carpenter Mfg. Co., Bridgeport, Conn., manufacturer of hardware supplies, has closed bids on a one-story addition, 52x132 ft.

United Electric Light Co., Springfield, Mass., contemplates erection of a one-story substation early next year.

Philadelphia

PHILADELPHIA, Nov. 4.—Plans have been filed by United States Gypsum Co., 1500 Walnut Street, Philadelphia, for two-story storage and distributing unit, to cost $80,000 with mechanical-handling and other equipment.

F. G. Vogt & Sons, Inc., Thirtieth and Race Streets, Philadelphia, meat packer, is asking bids on general contract until Dec. 2 for new three- and four-story plant, to cost about $1,000,000 with equipment. A refrigerating and power plant will be installed. C. B. Comstock, 110 West Fortieth Street, New York, is architect and engineer.

Gimbel Brothers, Ninth and Market Streets, Philadelphia, have plans for a two-story automobile service, repair and garage building, 124 x 230 ft., to cost about $170,000 with equipment. Abbott, Merkt & Co., 175 Fifth Avenue, New York, are architects and engineers.

Philadelphia Quartz Co., 121 South Third Street, Philadelphia, has acquired a 4-acre tract in Locust Point district, Baltimore, and is contemplating new plant on site to manufacture silicate of soda products, to cost more than $100,000.

Officials of Radio Corporation of America, Inc., Woolworth Building, New York, and affiliated organization, Victor Talking Machine Co., Camden, N. J., have formed R. C. A. Victor Corporation, a new subsidiary, for manufacture, research and sales of radio equipment, talking machines and other equipment heretofore produced by Radio Corporation, General Electric Co., and Westinghouse Electric & Mfg. Co. It is expected to complete new unified operation during next 60 days, with bulk of production to be carried out in future at Camden plant, which will be arranged for increased production. E. E. Shumaker, president of Victor Talking Machine division, will be president of new organization.

Marvel Oil Co., Shubert Building, Philadelphia, has leased three-story building at 2328 Fairmount Avenue, for new oil storage and distributing plant.

Curtis & Brothers Co., Newark, Del., Herbert W. Mason, president, operating a local paper mill, has purchased mill of Mount Holly Paper Co., Mount Holly Springs, Pa., and will take over property at once. Purchasing company has formed Curtis & Brothers Co. of Pennsylvania, Inc., a subsidiary, to operate mill and is planning expansion and complete modernization of plant, including installation

of equipment for production of book papers.

Penn Metal Co., Twenty-fifth and Wharton Streets, Philadelphia, has leased two-story and basement building, 115 x 250 ft., to be erected on Oregon Avenue, to cost about $75,000, exclusive of equipment, and will occupy for expansion.

Crew Levick Co., 219 North Broad Street, Philadelphia, is planning construction of oil storage and distributing plant near Perth Amboy, N. J., to cost more than $90,000 with equipment. A pumping plant will be installed.

Lebanon Steel Foundry Co., Lebanon, Pa., will soon begin superstructure for two-story addition to foundry, 150 x 182 ft., to cost more than $90,000 with equipment. Wilbur Watson & Associates, 4614 Prospect Avenue, Cleveland, are architects and engineers.

Steel Plate Products Co., Pottstown, Pa., announces a change in sales and purchasing policy effective Nov. 16, when these functions will be resumed by home organization. For some months sales and purchasing have been handled through agency of Plate Fabrications, Inc., with offices in New York and Philadelphia.

Pittsburgh

PITTSBURGH, Nov. 4.—October did not prove to be as good a month as was expected by some machine tool dealers in this district, but business was generally well ahead of the same month last year and there is more than enough inquiry before the trade to assure good showings for the remaining months of the year if it is all acted upon. Just now some buyers are inclined to postpone purchases in some lines, but it is not expected that any projects under active consideration will be entirely abandoned.

The only new inquiry of importance is that of the Pittsburgh Board of Education, which includes a fair-sized list of tools. Both the Westinghouse Electric & Mfg. Co. and the United States Aluminum Co. are placing tools regularly, but other purchases have included only single tools, or at least have been rather small.

Recent large industrial expansion projects which have been announced include improvements at Johnstown plant of Bethlehem Steel Corporation, where $10,000,000 will be spent, and at Etna, Pa., plant of Spang, Chalfant & Co., Inc.

Westinghouse Electric & Mfg. Co., East Pittsburgh, has plans for an eleven-story central engineering laboratory to cost about $350,000 with equipment, and will take bids soon on general contract. Bernard H. Prack, 119 Federal Street, Pittsburgh, is architect and engineer.

Pressed Steel Car Co., McKees Rocks, Pa., is considering a one-story addition. 60x140 ft., to cost about $50,000 with equipment. H. P. Hoffstat is vice-president.

Board of Education, Mount Lebanon, Pa., is considering installation of manual training equipment in new two-story high school to cost about $230,000, for which revised plans are being drawn by Ingham & Boyd, Empire Building, Pittsburgh, architects.

Pillsbury Flour Mills, Inc., Metropolitan Life Building, Minneapolis, Minn., has plans for new paper bag and paper sack manufacturing plant at Wellsburg, W. Va., to cost about $135,000 including machinery.

Chicago, Wilmington & Franklin Coal Co., 332 South Michigan Avenue, Chicago, Ill., will carry out expansion at mines Nos. 5 and 6, near Eccles, W. Va., including installation of new screening and cleaning equipment, conveying and other machinery, to cost more than $150,000.

United States Chain & Forging Co., Union Trust Building, Pittsburgh, has awarded a general contract to Fort Pitt Bridge Works, Inc., Oliver Building, for one-story addition to plant at McKees Rocks, 75x150 ft., for manufacture of automobile bumpers, to cost $45,000 with equipment.

South Atlantic

BALTIMORE, Nov. 4.—Bids will be asked on general contract this month by Levering Brothers, Inc., 200 Key Highway, Baltimore, manufacturer of sash weights and other iron castings, for one and two-story branch plant at Hanover, Pa., to cost about $100,000 with equipment. Part of structure will be used for storage and distribution.

Guilford Folding Box Co., Eager Street and Fallsway, Baltimore, has awarded general contract to Consolidated Engineering Co., 20 East Franklin Street, for new plant on Philadelphia Road, 160 x 205 ft., for manufacture of corrugated and other cardboard boxes and containers, to cost about $175,000 with equipment.

William A. Fingles, Inc., 29 South Howard Street, Baltimore, operating a sheet metal works, has awarded general contract to M. A. Long Co., 10 West Chase Street, for new two-story plant, to cost about $55,000 with equipment.

Rustless Iron Corporation of America, Inc., Loneys Lane and Pennsylvania Railroad, Baltimore, is considering new plant near Pittsburgh, to cost over $100,000 with equipment.

Parkway Motor Co., Inc., 1065 Wisconsin Avenue, N. W., Washington, local representative for Ford automobile, has plans for three-story service, repair and sales building, including body shop, on site recently acquired, to cost over $125,000 including equipment. David Stern, 1412 I Street, N. W., is architect.

Safe Harbor Water Power Corporation, a subsidiary of Pennsylvania Water & Power Co., Lexington Building, Baltimore, has awarded a general contract to Arundel Corporation, Knickerbocker Building, for power dam and power house for hydroelectric power project at Safe Harbor on Susquehanna River, to cost about $30,000,000 with steel tower transmission lines. Engineering design and purchase of equipment will be handled by company engineering department.

Simmons Co., Kenosha, Wis., manufacturer of metal bedsteads, springs, etc., has purchased plant and business of B. F. Huncley Furniture Co., Winston-Salem, N. C., and its subsidiary manufacturing interests. New owner will continue operation at present location and plans expansion program.

Mexican Petroleum Corporation of Georgia, Inc., Savannah, a subsidiary of Pan-American Petroleum & Transport Co., 122 East Forty-second Street, New York, has taken over a local 50-acre tract as site for a new refinery, with storage and distributing facilities, to cost about $850,000 with equipment. Superstructure for group of one-story units will soon be placed under way. A. M. McKeen is chief engineer, in charge.

American Loom Co., Greenville, S. C., recently formed with capital of $50,000 to manufacture textile machinery and equipment, plans early operation of local factory to cost about $40,000 with equipment. F. A. Lawton, 620 East McBee Avenue, Greenville, is president.

United Railways & Electric Co., Continental Building, Baltimore, will take bids early next year for one and two-story automobile service, repair and garage building for bus maintenance division, to cost about $250,000 with equipment. W. H. Emery, 18 East Lexington Street, is architect.

St. Louis

ST. LOUIS, Nov. 4.—Herman Body Co., Clayton and Newstead Avenues, St. Louis, manufacturer of automobile bodies, has awarded general contract to Murch Brothers Construction Co., Railway Exchange Building, for one-story plant, 130 x 160 ft., to cost about $40,000 with equipment.

Kansas Gas & Electric Co., Market Street, Wichita, Kan., has plans for one-story equipment storage and distributing plant, with general service, mechanical repair and other departments, to cost more than $300,000 with equipment. C. V. Waddington, Sedgwick Building, is engineer.

J. A. Werme Iron & Steel Co., North Indiana Street, Oklahoma City, Okla., will build a one-story addition, 100 x 300 ft., for storage and distribution, to cost about $30,000 with equipment.

Missouri-Pacific Railroad Co., Railway Exchange Building, St. Louis, is considering new engine house at Northern Kansas central branch division shops at Atchison, Kan., with machine and repair facilities, to cost about $140,000 with equipment. E. A. Hadley is chief engineer.

Missouri Valley Farmers' Association, Virginia Building, Columbia, Mo., has plans for three-story feed mill, with elevator, including screening, conveying and other mechanical equipment at Springfield, Mo., where site has recently been purchased, to cost about $100,000 with equipment. Southwestern Engineering Co., McDaniel Building, Springfield, is engineer.

Iowa-Nebraska Light & Power Co., Ninth and L Streets, Lincoln, Neb., has plans for new one-story steam-operated electric generating plant, to cost about $120,000, of which close to $80,000 will be used for equipment. Engineering department of company at Davenport, Iowa, is in charge.

North American Air Lines, Inc., Hunt Building, Tulsa, Okla., has secured 100-acre tract at Sapulpa, Okla., and plans airport with hangars, repair shop and other mechanical units, to cost more than $90,000 with equipment. W. L. Ives, Tulsa, is head.

Clay & Bailey Mfg. Co., Kansas City, Mo., and its subsidiary, Morgan Foundry Co., have purchased a 3½-acre site, between Gould Avenue and Frisco right-of-way for new plant. An existing building will house foundry, and a machine shop, warehouse and a cleaning room will be erected.

Chicago

CHICAGO, Nov. 4.—Sales of machine tools are steady to miscellaneous buyers. It is only the occasional purchaser who is interested in more than one piece of shop equipment. The Santa Fe will buy a 24-in. drill. The International Harvester Co. is shaping programs for several of its plants, but at present is taking only a few of its needs for its Farmall plant at Rock Island, Ill. A number of users in Milwaukee are in the market for individual tools. The Allis-Chalmers Mfg. Co., with tractor plants at Milwaukee and Springfield, Ill., has announced expansion programs and the trade is looking forward to lists from this source. It is stated that orders received by machine tool manufacturers closely match production schedules and as a result deliveries have not improved.

Fargo Foundry Co., Fargo, N. D., has started erection of two additions, 45x77 ft. and 35x37 ft., for fabrication of structural steel and tank work.

Hardinge Brothers, Inc., 4149 East Ravenswood Ave., Chicago, manufacturer of oil burners and oil burning equipment, has plans for a four-story addition, to cost more than $90,000 with equipment. Paul McGrath, 38 South Dearborn Street, is architect.

Robert Zwick, 1247 Blue Island Avenue, Chicago, manufacturer of plumbing equipment and supplies, has awarded general contract to M. L. Bein, 100 North LaSalle Street, for two-story plant, 120x125 ft. to cost about $55,000 with equipment.

Ostrander-Seymour Co., 1900 South Fifty-fourth Avenue, Cicero, Ill., manufacturer of photo-engraving machinery and equipment, has purchased adjoining site for a one-story addition, 50x270 ft., to cost about $60,000 with equipment. George P. Cullen, Inc., 2940 West Lake Avenue, is engineer and contractor.

Board of Education, Proviso Township High School District No. 209, 124 South Seventeenth Street, Maywood, Ill., is considering installation of manual training equipment in three-story addition to local high school to cost $1,000,000, for which bids are being asked on general contract. J. C. Llewellyn & Son, 38 South Dearborn Street, Chicago, are architects.

Department of Public Works, City Hall, St. Paul, Minn., will begin superstructure at once for an equipment storage and distributing plant, with mechanical and electrical repair departments, to cost about $200,000 with equipment. Harry S. Bronson, City Hall, is acting city architect.

Board of Works, Fort Dodge, Iowa, has approved plans for a one-story machine and repair shop for municipal waterworks department, to cost about $30,000 with equipment.

Merit Hardware Mfg. Co., 2125 West Rice Street, Chicago, manufacturer of casket hardware, etc., is contemplating three-story plant unit, to cost over $250,000 with equipment.

Northern Malleable Iron Co., Forest and Wells Street, St. Paul, Minn., has awarded a general contract to Romer Construction Co., 190 Ramsey Street, for a one-story addition.

Gears & Forgings, Inc., 1001 West Washington Boulevard, Chicago, has acquired a plant at 2108-20 North Natchez Avenue, for expansion, and will concentrate all local production at new location.

Indiana Limestone Co., Tribune Tower Chicago, states that report published in THE IRON AGE of Oct. 10, that it has organized Texas Quarries, Inc., was incorrect. Operations of Indiana Limestone Co. are confined to Monroe and Lawrence counties, Indiana.

Manco Mfg. Co., Bradley, Ill., manufacturer of wood-working machinery and hardware, is enlarging its plant at a cost of about $25,000 and is installing heating and ventilating equipment and new machinery. A new building will give about 10,000 sq. ft. of additional floor space.

Indiana

INDIANAPOLIS, Nov. 4.—Contract has been let by United States Radio & Television Co., 1340 South Michigan Avenue, Chicago, to Bowman Construction Co., Marion, for one-story engineering building, 115 x 125 ft., at Marion, part of structure to be used for administration purposes, to cost $60,000 with equipment.

Auburn Automobile Co., Auburn, has plans for two-story addition, to be used in part for storage and distribution, to cost $70,000 with equipment. A. M. Strauss, Cal-Wayne Building, Fort Wayne, is architect.

Utah Radio Products Co., 1615 South Michigan Boulevard, Chicago, manufacturer of radio equipment and parts, has acquired Caswell-Runyan Co., Huntington, manufacturer of kindred apparatus, and will consolidate. Plant will be continued at Huntington and expansion in output is planned. Purchasing company has also acquired Carter Radio Co., 300 South Racine Avenue, Chicago, and will merge with organization. Utah company has authorized increase in capital stock from 250,000 to 1,000,000 shares, part of proceeds to be used for acquisitions noted and expansion.

Hoosier Desk Co., Jasper, Ind., has awarded general contract to Carl Keller, 818 DuBois Street, for three additions, consisting of two production units, 60 x 85 ft., and 23 x 35 ft., and one-story power plant, 48 x 60 ft., to cost over $85,000 with equipment. Thole & Legeman, American Trust Building, Evansville, are architects. S. G. Norman is general manager.

Fire King Stoker Co., 1159 Roosevelt Avenue, Indianapolis, is considering one-story assembling plant addition, to cost about $100,000 including equipment.

Cincinnati

CINCINNATI, Nov. 4.—As a result of the spurt in fresh bookings of machine tool manufacturers and a steady demand the latter part of the month, the October volume of business was a trifle ahead of that of September. In fact, one leading manufacturer of lathes indicates that October will rate as one of the best months this year. Production continues at the high rate that has prevailed for the last six months, district manufacturers still having heavy backlogs. Inquiry has slackened somewhat the past week.

Plans have been filed by Burkett Closed Body Co., 541 Master Avenue, Dayton, Ohio, manufacturer of automobile bodies, for extensions and improvements in three-story factory, to cost about $25,000.

State Department, Columbus, Ohio, has plans for one-story and basement power plant, to cost over $200,000 with equipment. T. R. Ridley, Ohio Hartman Building, is architect, in charge.

Board of Education, Marion, Ohio, is contemplating installation of manual training equipment in new junior high school in Oakland Heights section to cost more than $250,000, for which bids will be asked on general contract this month. Garber & Woodward, 4 West Seventh Street, Cincinnati, are architects.

Dayton Power & Light Co., Dayton, Ohio, has filed plans for addition to steam-operated electric generating plant, to cost about $200,000 with equipment. Company is a subsidiary of Columbia Gas & Electric Co., Cincinnati, and engineering department of latter organization is in charge.

Tennessee Cereal Co., Franklin, Tenn., plans installation of electrically-operated drying equipment, conveying machinery, steam cookers, roller mills and other equipment in new one-story plant, 100x 200 ft., to cost about $100,000 with machinery. B. W. Ernst is president.

Pennsylvania-Dixie Cement Corporation, Kingsport, Tenn., is contemplating an expansion at local mill, including installation of machinery for wet process operation, to cost upward of $100,000. Headquarters of southern division are at Chattanooga, Tenn. W. H. Klein is general manager.

Frigidaire Corporation, Taylor Street, Dayton, Ohio, a subsidiary of General Motors Corporation, has awarded general contract to T. E. Patterson, Dayton, for one-story addition, 78x127 ft., and improvements in present plant, to cost about $40,000 with equipment.

Detroit

DETROIT, Nov. 4.—Plans are under way by McCord Radiator & Mfg. Co., 2587 East Grand Boulevard, Detroit, manufacturer of automobile radiators, etc., for a one-story top addition to present three-story plant, to cost about $50,000 with equipment. Smith, Hinchman & Grylls, Marquette Building, are architects and engineers.

Fitzjohn Mfg. Co., Muskegon, Mich., manufacturer of commercial automobile bodies, is planning a one-story addition, totaling 20,000 sq. ft. floor space, to cost about $55,000 with equipment.

Detroit Transfer Co., 1720 Twelfth Street, Detroit, has plans for a two-story automobile service, repair and garage building, 110 x 200 ft., for motor trucks and passenger cars, to cost about $120,000 with equipment.

Otis Steel Co., Jennings Road, Cleveland, is considering one and two-story factory branch at Detroit, for storage and distribution, to cost more than $65,000 with mechanical handling equipment.

Sheet Aluminum Corporation and affiliated organization, Hybinette Patents Corporation, Jackson, Mich., have acquired a local building and will remodel for early occupancy by last noted company as a metallurgical and experimental laboratory for work in aluminum alloys and other metals.

American Enameled Wire Co., Water Street, Muskegon, Mich., is said to be planning one-story addition to cost in excess of $45,000 with equipment. A. R. Thornton is manager.

White Star Refining Co., 903 West Grand Boulevard, Detroit, has begun con-

struction of a lubricating oil unit at Avery Avenue and Grand Trunk Railroad. A sign manufacturing plant, as well as storage and distributing plant will be built at Charles and Mount Elliott Avenues. Entire program will cost more than $100,000 with equipment.

United States Aluminum Co., 3311 Dunn Road, Detroit, has plans for one-story unit, 100 x 375 ft., to manufacture aluminum parts, etc., to cost about $80,000 with equipment.

Standard Steel Shelving Co., recently organized to manufacture steel shelving, is now in operation at its plant, 1326 Woodridge Avenue, Detroit.

A C Spark Plug Co., Flint, Mich., is planning a three-story addition, to cost about $100,000.

Milwaukee

MILWAUKEE, Nov. 4.—Sales of machine tools in October were a little less than in August, but equal to those in September. Some dealers report a slight recession toward the end of the month, but machine tool manufacturers have not experienced much falling-off in orders, with more business coming from the East than from this territory. Production of large automobiles has dropped considerably, but the manufacture of small and medium sized cars, while much below last year's high mark, is nevertheless fair.

Milwaukee Gray Iron Foundry Co., Thirty-ninth Avenue, Milwaukee, has begun work on one-story cleaning room, 35 x 130 ft., and core oven building, 25 x 40 ft.

Royal Airways Corporation, 614 East Gorham Street, Madison, Wis., is building a hangar, 100 x 135 ft., including machine and service shop. Flad & Moulton, Madison, are architects.

Wisconsin Cylinder Co., 1308 Eighteenth Street, Racine, Wis., manufacturer of motor blocks, is erecting two shop additions, 40 x 70 ft. and 28 x 60 ft.

Beloit Iron Works, 815 Second Street, Beloit, Wis., manufacturer of paper mill machinery and equipment, has begun work on one-story addition, to cost about $35,000.

Kiel Furniture Co., Milwaukee and Kiel, Wis., will build a three-story addition to factory at Kiel, 66 x 102 ft. J. B. Laun is in charge; Van Ryn & De Gelleke, 114 Wisconsin Avenue, Milwaukee, are architects.

Lakeside Malleable Casting Co., 23rd and Clark Streets, Racine, Wis., has begun work on one-story addition to its foundry, 60 x 80 ft., costing about $10,000 and one-story pattern storage vault, 40 x 60 ft.

Gulf States

BIRMINGHAM, Nov. 4.—Plans have been approved by Nichols Copper Co., 25 Broadway, New York, for one-story power plant at new refinery at El Paso, Tex., to cost about $100,000 with equipment.

Certain-teed Products Corporation, 100 East Forty-second Street, New York, is considering one-story addition to wallboard mill at Agatite, Tex., to cost more than $100,000 with equipment.

Hughes Tool Co., 300 Hughes Street, Houston, Tex., manufacturer of oil well tools and equipment, has taken out a permit for one-story addition, 35 x 180 ft., to cost about $50,000 with equipment.

Jacob E. Salie, Empire Building, Birmingham, architect, has plans for two-story automobile service, repair and garage building, 140 x 150 ft., to cost about $100,000 with equipment.

Day Mfg. Co., Sherman, Tex., manufacturer of corrugated paper boxes and containers, has leased one-story building to be erected at South Crockett and West Jones Streets, 65 x 145 ft., for new plant, to cost about $45,000 with machinery. Clyce & Rolfe, Sherman, are architects.

Universal Metal Mfg. Co., Tarrant, Ala., has awarded general contract to Price & Belcher, 2904 North Twenty-seventh Street, for one-story addition, 75 x 125 ft., to cost about $28,000 with equipment. Charles H. McCauley, Jackson Building, Birmingham, is architect.

J. N. McDonald, 714 First Bank & Trust Co. Building, Sarasota, Fla., and associates have secured permission to use water from Oklawaha River in Putnam and Marion Counties for hydroelectric power development, for which plans will be prepared by George L. Pratt, Citizens' & Southern Bank Building, Atlanta, Ga., engineer. Station will have capacity of about 15,000 hp., and will cost more than $900,000 with transmission system.

Board of Education, Texarkana, Tex., is considering installation of manual training equipment in new high school, to cost about $150,000 with equipment. Witt, Seibert & Halsey, Texarkana, are architects.

Cleveland

CLEVELAND, Nov. 4.—The spurt of buying that followed the National Machine Tool Exposition appears to have spent itself. At least sales declined the past week. However, with a good volume of business during part of the month, October sales showed some gain over September. Orders placed during the week were for single machines and were well distributed throughout various industries. Virtually no buying is being done by the automotive industry and very little business is expected from that source during the remainder of the year.

The Nickel Plate Railroad has purchased a 6-ft. radial drill. While some other railroad business is in prospect, it is not expected that it will be placed in the immediate future.

E. T. Pierce Co., 4903 Harlem Avenue, Cleveland, manufacturer of tools, dies, etc., has awarded general contract to Ray P. Adams, 975 Roanoke Road, for one-story plant, 65 x 100 ft., to cost about $45,000 with equipment. George A. Ebeling, 737 Prospect Avenue, is architect.

Electric Auto-Lite Co., Toledo, Ohio, manufacturer of automobile starting and lighting equipment, has plans for an addition, to cost $1,000,000 with equipment. Company also has plans for new branch plant at Sarnia, Ont., to cost about $3,000,000 with machinery. Fred A. Hahn, Gardner Building, is architect. C. O. Miniger is president.

Wheeler Metal Products Co., 1637 Collamere Road, Cleveland, has plans for one-story factory, 80 x 300 ft., to cost about $140,000 with equipment. Austin Co. is engineer.

Sinclair Auto Service Corporation, 2540 West Twenty-second Street, Chicago, M. J. Kirby, head, has plans for a one-story mechanical and repair shop at Cleveland, to cost about $85,000 with equipment. Shattuck & Layer, 134 North LaSalle Street, Chicago, are architects.

Tuscan Tire & Rubber Co., Carrollton, Ohio, is considering early rebuilding of plant destroyed by fire Oct. 29.

Acme Refining Co., 3591 West Fifty-sixth Street, Cleveland, manufacturer of greases, lubricants, etc., has plans for two-story addition, to cost about $150,000 including equipment.

Cleveland Heights Air Terminals, Inc., 1060 Quilliams Road, Cleveland, has plans for airport on Ridgebury Boulevard, comprising hangars, repair and reconditioning facilities, oil storage and other mechanical units, to cost more than $125,000 with equipment. James R. Gloyd, care of A. M. Allen Co., Marshall Building, is engineer.

Youngstown Steel Car Door Co. has transferred manufacturing operations from Cleveland to a new plant at Wickliffe, Ohio. Its product has heretofore been fabricated by Midland Steel Products Co. Officials advise that company has enough unfilled tonnage t ooperate at a capacity until next March.

Pacific Coast

SAN FRANCISCO, Oct. 31.—Heintz & Kaufman, Inc., 219 Natoma Street, San Francisco, manufacturer of radio equipment, etc., has awarded contract to Barrett & Hilp, 918 Harrison Street, for four one-story plant units at South San Francisco, to be used primarily for experimental work, to cost $70,000 with equipment. Company has a 6-acre site at location noted, and is said to be planning other units later. E. A. Neumarkel, 544 Market Street, is architect.

Western Pipe & Steel Co., 5717 Santa Fe Avenue, Los Angeles, is planning one-story addition, 130 x 345 ft., for forge and heavy plate shop, to cost about $50,000 with equipment.

Truscon Steel Co., Los Angeles, is planning one-story addition, 60 x 150 ft., to storage and distributing plant, to cost about $35,000. Headquarters are at Youngstown, Ohio.

Imperial Irrigation District, El Centro, Cal., is arranging an early election to vote bonds for $2,000,000, proceeds to be used for a new Diesel engine type electric generating plant in Imperial Valley district, including transmission lines, for which plans will soon be drawn by engineering department.

Rainier Pulp & Paper Co., Shelton, Wash., is planning an expansion program, with installation of additional equipment, to cost over $400,000. Main offices are at 354 Battery Street, San Francisco.

Little Pittsburgh Mining Co., Wallace, Idaho, Herman J. Rossi, in charge, is planning installation of new flotation mill, to cost more than $850,000 with machinery.

Overhead Door Co. of California, Inc., 1410 Madison Street, Oakland, Cal., manufacturer of metal garage doors, etc., has plans for a one-story plant to cost about $35,000 with equipment. G. L. Brown, American Bank Building, is architect.

Technical Glass Co., Vernon, near Los Angeles, has awarded a general contract to R. G. Brownell, 2528 East Slauson Avenue, for a one-story plant, 40 x 110 ft., at Vernon, to cost about $25,000 with equipment. H. W. Charlton, 2528 East Slauson Avenue, is architect.

Foreign

ERECTION of a cane sugar refinery has been authorized by Redo Sugar Co., Los Mochis, Mexico, at local properties, to cost over $200,000 with machinery.

Graham-Paige International Corporation, Paris, France, a subsidiary of Graham-Paige Co., Detroit, manufacturer of automobiles and motor trucks, is arranging for establishment of European headquarters at Antwerp, Belgium, under name of Société Anonyme Graham-Paige Belgique. Plans are under way for factory branch and parts plant at Antwerp, including storage and distributing facilities, to cost over $100,000.

Standard Sanitary Mfg. Co., Bessemer Building, Pittsburgh, subsidiary of American Radiator & Standard Sanitary Corporation, 40 West Fortieth Street, New York, has work under way on a new plant near Berlin, Germany, to manufacture brass goods and enameled ware, to cost more than $200,000 with machinery. It is expected to be ready for service early next year. Plant will supplement another works now being completed on adjoining site for manufacture of sanitary ware products.

H. V. McKay Pty., Ltd., Melbourne, Australia, manufacturer of a new type reaping and threshing machine, is arranging for early construction of new plant at Waterloo, Ont., in cooperation with Waterloo Mfg. Co., manufacturer of agricultural equipment, for exclusive production of new equipment, including parts and assembling departments, reported to cost more than $700,000 with machinery. It is proposed to organize a new company with capital of $2,500,000 to carry out project, to be controlled jointly by two organizations noted.

Canada

TORONTO, Nov. 4.—Machine tool sales have been slowing up the past week or ten days. Prospective demand, however, appears bright and local distributers and builders look upon this as but a temporary lull. Inquiries for new works are in good number, but the majority calls for single tools. The automotive industry is holding its purchases close to actual replacement needs and buying from this source is somewhat limited.

In Manitoba, Saskatchewan and Alberta, the recent expansion of domestic manufacturing has created a steadily increasing demand for industrial machinery. While machine tools are not so prominent in the sales lists to these provinces, mining equipment, pulp and paper mill and road building machinery have been quite active. One feature of the business in the West is that the greater part of the equipment is imported from the United States.

Plans are being prepared for a $2,000,000 linoleum manufacturing plant at Farnham, Que., for Barry, Ostlere & Shepherd, Ltd., Kirkcaldy, Scotland. J. M. Robertson, 1140 St. Catharine Street, Montreal, is consulting engineer. Work will start early in 1930.

Canadian Industries, Ltd., 1050 Beaver Hall Hill, Montreal, has started work on additions to its plants at Sandwich, Ont., which will represent an expenditure of $175,000.

Mill and equipment at Dome Mines, Ltd., South Porcupine, Ont., were recently destroyed by fire with a loss estimated at $750,000. It is planned to rebuild at once, at a cost of about $1,000,000.

Western Bridge Co., is planning to build an addition to its plant at Vancouver, B. C., to cost over $500,000. Company is affiliated with Hamilton Bridge Co., Hamilton, Ont., which recently acquired Coughlan Steel Plant, Columbia Street, Vancouver.

Western Mfg. Co., Regina, Sask., contemplates building a one-story addition, 64 x 173 ft., to cost $300,000.

United Mfg. Co., Cap de la Madeline, Que., has awarded contract to Charles Page Construction Co., Three Rivers, Que., for a three-story factory to cost $60,000, to be completed by Dec. 15.

Superior Alloys, Ltd., Hudson and Portage Streets, Sault Ste. Marie, Ont., has awarded additional contracts for a steel plant to cost $75,000

International Nickel Co., Port Colborne, Ont., is preparing to start work on an addition and has awarded steel contract to Standard Steel Construction Co., Welland, Ont.

International Harvester Co., Burlington Street East, Hamilton, Ont., has awarded contract to Humphrey Brothers, 214 Burlington Street East, for a one-story factory addition.

B. H. & Fred Prack, Pigott Building, Hamilton, Ont., have plans for a four-story addition to plant of B. Greening Wire Co., Hamilton.

New Trade Publications

Rotary Displacement Meters.—Connersville Blower Co., Connersville, Ind. Bulletin No. 305 illustrates different installations of Connersville rotary displacement meters for the measurement of gas. The fact is pointed out that the product is readily adaptable to unusual as well as ordinary requirements.

Lamp Hangers.—Thompson Electric Co., Cleveland. A 32-page catalog describing Thompson safety-lowering hangers and accessories, including the new lamp shock absorbers. Profusely illustrated and discusses such subjects as the design, construction and operation of hangers, dimensions and screw-hole specifications, spare-parts schedule, installing and wiring, electrical characteristics and mechanical load. A table of contents is given for easy reference.

Mine and Industrial Safety.—Mine Safety Appliances Co., Pittsburgh. No. 4 general catalog, consisting of 160 illustrated pages, many of them in color, describes the mine and general safety equipment manufactured by the company. Among the products are Edison electric safety cap lamps and accessories, permissible shot firing devices, Wolf flame safety lamps, gas and air measuring devices, rock dusting equipment, oxygen breathing apparatus, safety clothing, eye and head protective equipment and a complete line of first aid supplies. A classified index is published in the front of the catalog.

Steel Floor Grating.—Walter Bates Steel Corporation, Gary, Ind. In a 12-page folder the company sets forth information about its steel floor grating. The two pages in the center are given over to a table of safe loads and deflections for main bar grating.

Lock Washers. — Shakeproof Lock Washer Co., Chicago. Several practical applications of the Shakeproof principle of locking are shown in a four-page folder.

Blast Furnace Brick Lining.—North American Refractories Co., Cleveland. A folder describing a new world's record for production per brick in blast furnace service set at furnace No. 1 of the American Rolling Mill Co., Ashland, Ky. Ashland steam-pressed blast furnace brick, a product of the company, was used as lining for the furnace.

Armco Ingot Iron.—American Rolling Mill Co., Middletown, Ohio. The third architectural rotogravure issued by this company is a pictorial review of numerous buildings throughout the country in which Armco ingot iron has been used.

Conveyor Equipment. — Saginaw Stamping & Tool Co., Saginaw, Mich. Bulletin on conveyor equipment covering in detail a new belt conveyor idler design, an all-steel unit, fully rust-proofed to meet severe weather conditions. Bulletin also covers all of the customary types of overhead conveyor trolleys, trolley wheels, roller turns and chain hoist trolleys, with illustrations.

Precision Instruments. — Gaertner Scientific Corporation, 1201 Wrightwood Avenue, Chicago. Catalog M-130, 80 pages. Reading and micrometer microscopes, including workshop and inspectors types; spherometers, levels; laboratory reading telescopes; and reading scales are described and illustrated. Sections are devoted to Cathetometers, comparators and dividing machines for both linear and circular graduations. Standard meters and scales are also shown.

Milling Machines.—Ingersoll Milling Machine Co., Rockford, Ill. Folder of four pages, illustrated, and describing two types of milling machines and a cutter grinder, all of which were exhibited at the Cleveland Machine Tool Builders' Exposition.

Steam Pressures for Industrial Plants.—Combustion Engineering Corporation, 200 Madison Avenue, New York. Pamphlet of eight pages consisting of a paper by W. A. Shoudy on determination of steam pressures for industrial plants. This has been reprinted from *Combustion*, August issue.

Extruded Shapes.—Taunton-New Bedford Copper Co., Taunton, Mass. A four-page leaflet, illustrated, discusses the company's 'Eagle Brand' of extruded shapes and recommends that "if it cannot be stamped or pressed, consider an extruded shape."

Heat Resisting Alloys.—Driver-Harris Co., Harrison, N. J. An attractive booklet of some 28 pages has been issued by this company. There are 13 reproductions of photographs with appropriate captions showing various

installations of Nichrome castings for use by a number of American companies.

Drilling and Centering Machines.—Sundstrand Machine Tool Co., Rockford, Ill. Leaflet describing single and double-end drilling and centering machines.

Steel Castings.—Sivyer Steel Casting Co., Milwaukee. A four-page illustrated leaflet discusses "Fewer Dollars; Lower Inventories; Sivyer Castings." Data for the physical properties of a heavy drive pinion of chrome alloy steel are given.

Corrosion-Resistant Alloys.—International Nickel Co., New York. In a 16-page pamphlet entitled "Meeting the Metal Requirements of the Process Industries," corrosion data are given for a number of corrosion-resistant alloys into which nickel enters and the varied equipment into which they are incorporated. These are shown by illustrations and there is also a table giving known and established users of monel and nickel to overcome corrosive action.

Welding Rod for 18-8 Steels.—Fusion Welding Corporation, Chicago. Bulletin No. 4 gives physical characteristics of welding rod suitable for joints in high chromium-nickel steels, and welding technique is described.

Condulets, Groundulets, etc.—Crouse-Hinds Co., Syracuse, N. Y. Bound Catalog 2200 of 280 pages illustrates and describes a variety of condulets, groundulets and plugs and receptacles. This supersedes all previous listings. It is cross indexed and covers a great variety of items.

Gears.—Westinghouse Electric & Mfg. Co., East Pittsburgh. Folder 5223, containing pertinent facts about heat-treated gears and their use. Full description of BP, "tough-hard" and the EP processes, created and used in heat treating Westinghouse-Nuttall gears is included.

Water-Wheel Electric Generating Unit.—James Leffel & Co., Springfield, Ohio. Bulletin W207 illustrating and describing briefly a new self-contained water-wheel electric generating unit.

Rotary Positive Blowers.—Connersville Blower Co., Connersville, Ind. Bulletin 123 of 8 pages illustrating and describing the RSB and RBB series of rotary positive blowers. Principal features are the Boston type arrangement with double outer bearing supporting both shafts, use of renewable split-sleeve babbitt lined bearings or of anti-friction bearings. Tables of capacity and pressure ratings are given.

Self-Priming Centrifugal Pumps.—Duriron Co., Dayton, Ohio. Bulletin 155 of 4 pages illustrates and describes a series of Duriron centrifugal pumps with direct motor drive. Details concerning individual parts are covered.

Footlift Truck.—Lewis-Shepard Co., Watertown, Mass. Four-page folder No. 100 illustrating and describing a new lift truck constructed to operate by foot for loads up to 3500 lb. It is made in several sizes, weighing from 228 to 307 lb.

Jacklifts and Stackers.—Lewis-Shepard Co., Watertown, Mass. Four-page circular No. 57 illustrating and describing the Jack-Stack-Rack system for stacking many materials, including small castings and other parts, in bins.

The Week's News Quickly Told

Current Events That Bear on the Course of Business

SECURITIES were sold in such unprecedented volume that the New York Stock Exchange closed two days to enable brokers to straighten out their books. As a measure of the decline, the quotational value of 240 leading issues lost more in September and October than all their gains since January first. Banks were forced to assume two billions of loans called by out-of-town banks and others, even though the grand total of brokers loans was reduced a billion.

* * * * *

INSOLVENCIES show no unusual increase in number. Prominent among them are the Foshay companies of Minneapolis, which control a number of minor public utilities, and a Chicago bank which tied up its funds in a large building project.

* * * * *

MONEY continues at an easy rate. Federal Reserve rate to member banks was reduced from 6 to 5 per cent; Bank of England also dropped its rate ½ per cent.

* * * * *

RETAIL trade is considered fair—about equal to the same week in 1928—but reduced somewhat from the preceding week. The general level of wholesale prices is slowly decreasing; wholesale business generally is hesitant, commitments being deferred until the effect of the stock market's fluctuation can be appraised. Stocks of manufactured goods are reported slightly smaller than a month ago, but raw materials on hand are much larger.

* * * * *

COMMODITY prices have dropped steadily since July, Fisher's index then being 98.6, now 93.7. Wheat prices rebounded rapidly on active foreign buying, and on the absorption of most of the Argentine crop. . . . Brazilian business is acutely depressed in sympathy with coffee prices—the lowest since 1923. Proposals for a moratorium or a currency issue were rejected by the Government, which is advising orderly liquidation of accumulated stocks.

* * * * *

TEXTILES, especially cotton, have been overproducing, said Lincoln Baylies, president New England Mill Men's Association. Spindles made nearly as much in last eight months as during entire record-breaking year of 1927; insufficient demand has depressed prices of cotton cloth and reduced the mill margin by 5c. in two years. . . . Wool is quiet, but prices are steady. . . . Full-fashioned hosiery, reflecting the influence of short skirts, increased two-thirds in value since 1925, and the number of mills from 92 to 235. . . . A survey of New England industries shows that the losses in textiles and shoes have been counterbalanced by increasing manufacture of tools, typewriters, bicycles and tableware.

* * * * *

FORD MOTOR CO. reduced prices on all models an average of $30. . . . Exports of automotive products in September amounted to $35,000,000, about the same as 1928. . . . Responsive to the slump in automobile production, the plate glass industry is curtailing, although business in mirrors, window glass and wire glass continues in good volume and at higher prices. . . . All organized surface transit is decreasing in New York; even the busses are carrying 8 per cent fewer passengers than last year, they riding in subways, taxicabs and private cars. . . . Approval was given to the final link in the super-highway leading from the Hudson river tunnels across New Jersey to Camden, in the form of a $19,000,000 bridge and viaduct across the Hackensack meadows.

* * * * *

MORTGAGES on small homes in Philadelphia have been foreclosed in such a number that the Real Estate Board has requested all trust companies to extend due dates six months. . . . A trust fund of $10,000,000 has been bequeathed by T. E. Mitten to foster the cooperation between capital and labor, as exemplified by his management of the Philadelphia traction system. . . . Western Union increases the wages of minor employees a total of $2,000,000, according to a merit system judged by a joint committee of officials and employees. . . . Actuaries have worked out a pension plan for Westinghouse Electric & Mfg. Co., which will cost 1.2 per cent of the payroll and be administered by an independent trust company. . . . A. I. du Pont has instituted a pension system to meet the urgent needs of the aged in Delaware.

* * * * *

MILLION-DOLLAR or more yearly incomes were enjoyed by 290 Americans in 1927; this bracket of income returns has steadily increased since 1921, when there were 21 such persons. Total net incomes reported in 1927 was about equal to 1926; taxable corporation returns numbered the same, but the total of net earnings was off 7 per cent to nine billion.

* * * * *

CONSOLIDATIONS reported were Butler Brothers of Chicago with American Wholesale Corporation of Baltimore (combined mail order sales $100,000,000); and Stephen Sanford & Sons with Bigelow-Hartford Carpet Co. (combined annual sales $35,000,000).

* * * * *

PROHIBITION was abandoned by Nova Scotia, the last but one of Canadian provinces to adopt the plan of bulk sales of liquor in Government stores.

Apprentice Training Pays Dividends

New High Standards Result in Developing Young Men for Responsible Executive and Technical Positions

BY F. L. PRENTISS*

HIGHER standards of apprenticeship training and entrance requirements which call for more extended preliminary public school education have been adopted by the Warner & Swasey Co., Cleveland, in its apprentice training school with a view to obtaining a higher goal in developing young men for responsible executive and technical positions in modern industry.

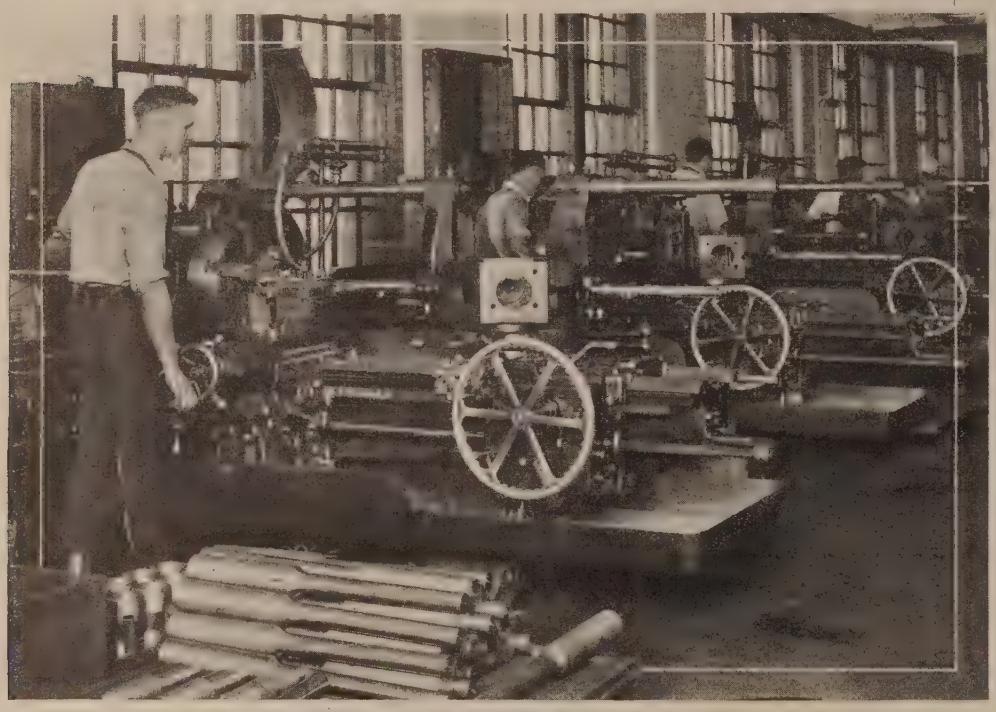
With changed conditions in production, men with specialized training have in large measure replaced skilled machinists as machine operators in production shops, usually working an indefinite time in repetitional opera-

*Resident editor, THE IRON AGE, Cleveland.

The Apprenticeship Training Class of the Warner & Swasey Co. Is Shown in the Upper Illustration. The lower illustration shows blackboard instruction in a class room

tions. While specialization, of course, has contributed to mass production, it has frequently been pointed out that the development of the man has been neglected except for his own routine operations and he has not been given an opportunity to broaden to an extent that he will become potential executive timber. On the other hand, with the growth of industries there has come an increase in the demand for men capable of filling the various supervisory and technical positions.

In successful operation for 45 years, the Warner & Swasey training school has made minor changes from time to time in its standard methods in order to keep pace with the changing conditions in industry. Whatever at times crept in the school organization that was regarded as too much red tape was speedily eliminated, and simplicity marks the operation of the school. It is run along practical and flexible lines with low overhead and very little clerical detail.



STUDENTS Are Put on Machines at the Start, the Shop Training Being Augmented by Class Room Work. There is no shop training room, but apprentices are assigned to the various production departments in rotation, each apprentice being under the direct supervision of a foreman. Usually four machines in each department are reserved for the use of apprentices

Plant Executives Are School Graduates

While the fundamental purpose of the Warner & Swasey training school—to give a good mechanical training as a stepping stone for higher positions—is not new, it is being emphasized by the raising of the standards. Its past success in this direction is shown by the fact that the works manager, two superintendents, the chief designer, metallurgist, estimators, time-study men, several foremen and assistant foremen, some branch office managers and several salesmen are graduates of the school. Other graduates hold important positions with other companies.

Formerly applicants who had passed through the eighth grade of the public school were admitted to the training school. Now the young men to be enrolled must have an education equivalent to at least two years' work in a Cleveland high school. However, a majority of the new pupils are high school graduates. The age limit of admission has been narrowed, now being 17 to 19 years, as compared with a former range of 16 to 20 years. It is desired that all apprentice supplement their work in the apprentice school by attending one of the various night schools in Cleveland, this being advised whether they are high school graduates or not. In making up a curriculum of night school studies, the apprentice is aided by the supervisor of the apprentice school in the selection of studies that will fit in well with his work. Night school attendance is also emphasized to the whole personnel of the company.

The applicant must be physically sound and of good habits and character. Extreme care is taken in the selection of apprentices in order to secure the right type of young men or those who give promise of having latent talent that will make them fitted for the mechanical field. To avoid the possibility of improper placement, the student who is admitted is taken for a six months' probationary period. That is regarded as a sufficient time to judge his adaptability.

Probationary Period the Important Test

During the trial or probation period the apprentice system is put to an important test. The work during that period must be of training value if the purpose of the trial period is to be fulfilled. The apprentice is given a class of work that is interesting and at the same time not too difficult or he will become discouraged. During this period it must be decided for the good of the young man and his employer whether the former has the ability to master the trade. If it is found that he has selected a vocation for which he is not fitted, it is only fair to him that he is not permitted to serve the four-year course.

A report of the applicant's progress and general deportment is made to the superintendent at the first of each month during the trial period. If at any time it is found that he is not qualified for his work, his services may be terminated. If the applicant is found satisfactory at the expiration of his trial term, he is engaged as a regular apprentice and signs an agreement to remain with the company 3½ years longer.

While there is no definite division of apprentices in their classroom and shop work, under the flexible arrangement that prevails they can be fairly well divided into two groups based on their preliminary education. Those with

COMPLETE Records Are Kept of the Work Done by Apprentices. A monthly record is made up by the foremen in the department in which an apprentice is working, and the data from this shop record are used in making up another record which includes grades for school work. A quarterly report is sent to the boys' parents. Still another blank is used in transferring a boy from one department to another

only two years in high school generally become shop employees and will fill positions as foremen, assistant foremen, inspectors and tool makers.

The apprentices who are high school graduates usually get more out of their apprentice course than the boys in the other group and are inclined to qualify for more responsible positions, including those of junior engineers. The training usually qualifies the apprentices in this group to hold positions of other usefulness than shop work and they probably would become discontented if kept in the shop an indefinite time. These apprentices in many cases are fitted to become designers, estimators, time-study men and to go into the sales department. Many develop into good designers because of their wide shop experience and advanced technical training accomplished by earnest application to night school efforts.

While not graduate engineers, they have a rather broad preliminary training in engineering, being given a good grounding of the fundamentals of engineering. However, all apprentices, regardless of their pre-apprenticeship education, are on the same footing. They are given the same opportunity to succeed whether they are high school graduates or not.

Aim Is to Train Production Experts

The school aims to train experts in production. The students are put on machines at the start and the shop training is augmented by class room instruction in such subjects as are applicable to the everyday shop experience of the boy. The curriculum has passed through an evolution founded on past experience. The week's schedule includes 45 hr. of shop work and 4 hr. in the class room, class room work being for 40 weeks of the year. This includes such subjects as shop mathematics, machine drawing, applied mechanics, materials of construction and organization. The curriculum follows:

First year: shop arithmetic, vernier reading, gearing speeds and feeds, taper measuring, etc.; algebra with practical applications; shop practice, machine tools, care and operation; mechanical drawing, principles of engineering drawing.

Second year: algebra, shop practice and mechanical drawing, continuation of the first year.

Third year: mechanics, practical and applied mechanics; trigonometry, practical application to shop problems, mechanical drawing, detail drawing.

Fourth year: metals, chemistry, manufacture and physical properties of materials of construction, etc.; metallography, heat treatment; machine design, gears, cams, etc.; shop electricity—a course for the non-electrical student.

A feature of the system is that there is no shop training room. Apprentices are assigned to the production departments, where they start production work on machines. Each apprentice is assigned to a foreman and is always under his jurisdiction. The foreman, however, is in part relieved of instruction by a shop instructor, who is an assistant to the school supervisor. Apprentices work on a production basis and are eligible to bonus.

Apprentices Routed Through Entire Plant

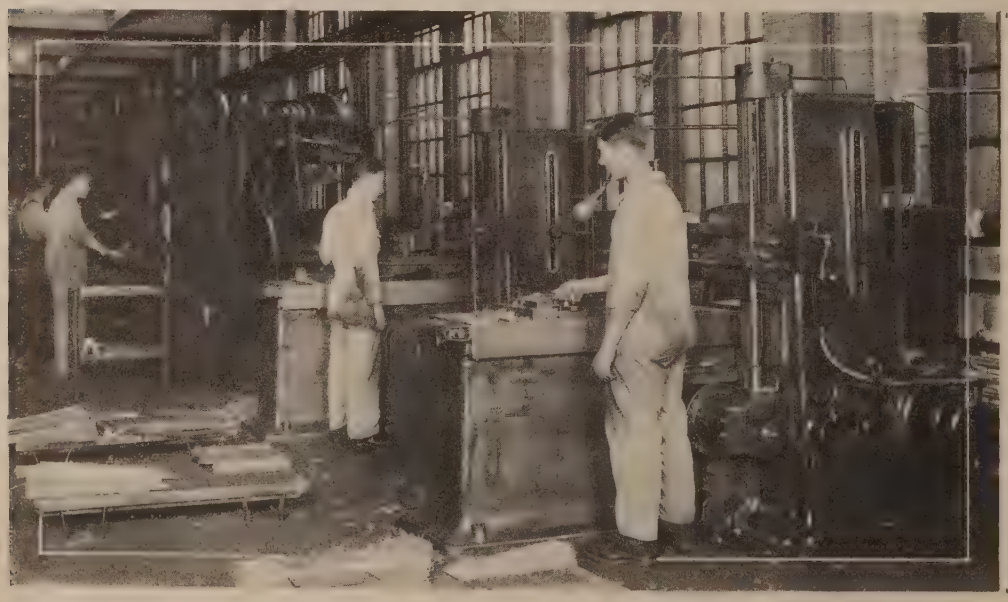
The boy is routed through the entire plant in a systematic way in order to give him an opportunity to gain complete knowledge of shop practice. This is accomplished by following a prescribed department schedule that was recently rearranged to eliminate work in departments that would mean a repetition of work already done and duplication of effort and at the same time to provide a logical sequence of training on various types of machines.

The method of scheduling fits in with the arrangement of equipment, which is grouped according to machines. Four apprentices are at work at a time in most departments and they spend four months in each of the 12 departments. An apprentice divides his time between different types of machines of the same general classification in each department and spends from one to two months on each machine except on a turret lathe, to which he devotes four months. For example, starting in the drilling department the apprentice spends two months on a vertical and two months on a radial drill. He follows the schedule through, being trained on the various types of machines in sequence and at the end of 40 months reaches the tool room. After leaving this he devotes four months to miscellaneous work. During the last four months he is given training along any special line that he may wish and may seem best fitted to follow. On the following page is the apprentice shop schedule.

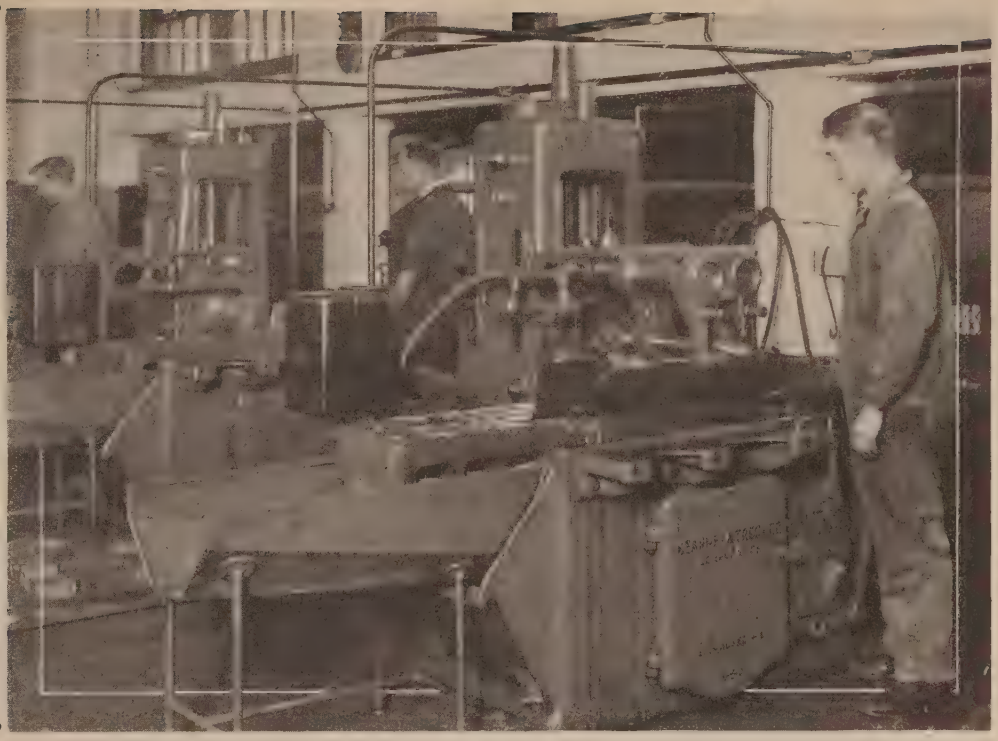
Machines, usually four in number, are reserved for the apprentices in most departments. With this plan an apprentice is always guaranteed a machine on which to work, and with four-month periods the scheduled changes become simplified.

Apprentices' Jobs Are Secure

An apprentice who is industrious, shows the proper capacity and complies with the rules and regulations is sure of holding his job, for he is never discharged because of curtailment of plant operations. There is an established



APPRENTICES at Work in the Planer Department. This and other pictures show that the apprentices are given their shop training on the best types of production equipment



APPRENTICES Operating Modern Type Simplex Milling Machines

rule that the number of apprentices in a department shall be limited to a maximum of 13 per cent of the total number of producers, but the number is usually kept below that percentage so that the danger is avoided of exceeding the percentage in case of a falling off in business.

Various activities are provided to interest the boys and encourage them to show their capacities. An annual essay contest is held, the boys competing in the writing of an essay or in the solving of a mechanical problem. Cash awards and trips to other industrial cities are the prizes. This contest has done much to stimulate interest, initiative and individual enthusiasm among the boys. Another activity is "The W. & S. Apprentice," a monthly publication edited by the apprentices. Material is prepared for the most part by the apprentices and the publication is distributed to the entire personnel of the company.

The Apprentice Club is an organization of graduates and apprentices and is carried on entirely by them. Meetings are held once a month and are preceded by a supper served in the company's cafeteria. The club's function is both educational and social.

Complete Records Kept of Boys' Work

A complete and accurate record is kept of each young man's work. A monthly apprentice shop record is made up by the foreman in the department in which he is located at the time. The data from the shop record is used in making up an apprentice work record, on which is also placed the grades for school work. A quarterly apprentice report is also made out and sent to the boys' parents. Letters are used for symbols in grading similar to the plan used in public schools. Another form provided is for the transfer of a boy from one department to another. This, signed by the apprentice and employment departments, gives complete authority for the transfer. In addition to these records, written reports of the workmanship, fitness and deportment of each apprentice, together with recommendations as to his future work, are made to the superintendent quarterly during the entire term of apprenticeship.

The boys are paid 25c. per hr. during the first six months of their apprenticeship and their pay is raised 2½c. per hr. at the end of each six months' period, so that during their last six months of training they are earning 42½c. per hr. They receive pay for the time spent in class room work. On completing his four years' training, each boy receives a gratuity of $100, a graduation pin and a certificate of apprenticeship in acknowledgment of his four years of faithful service.

School Pays Dividends in Production

Two questions frequently are asked in connection with an apprenticeship system. One is, "Does it pay?" and the other is, "Does a sufficient percentage of the apprentices remain with the company after graduation?" The Warner & Swasey Co. school is paying good dividends in produc-

tion. The work of the boys is satisfactory both in quality and volume. Apprentices having an average of three years' training are showing a shop efficiency of 85 per cent. In fixing the bonus for regular mechanics the shop efficiency is based at 75 per cent. The second question is also answered in the affirmative. Of the graduates of the school since 1915 more than 50 per cent are still in the employ of the company, and surely an important fact is that nearly all these hold responsible executive or technical positions and very few are in the ranks of machine operators. Of the 56 graduates since 1915 who are still employed by the company, four are tool makers, 11 are inspectors, one assembler, three estimators, one sales correspondent, six foremen, three assistant foremen, five machine operators, four designers, four demonstrators, two pattern makers, one tool room clerk, one purchasing clerk, one production clerk, six in sales department, one in cost department and two on time study.

The fact that the Warner & Swasey Co. has continued the practice of training apprentices for so many years is in itself evidence of the soundness of the policy. There is ample room—and indeed great need—for increasing the business of apprentice training throughout the metal-working industry.

Apprenticeships, in one form or another, have existed throughout the ages. Manufacturers have experimented from time to time to determine the most efficient way of training men for a given industry. At the present time many seem to believe that mass production has eliminated the need for trained men other than the specialized types. But, permit business to become active, and the lack of trained men becomes the same old complaint.

Chromium Plating on Brass or Iron

Chromium, when plated on brass or iron, is often faulty through errors in the preliminary deposition of nickel and not in the subsequent plating with chromium, according to W. Phanhauser, in a recent issue of *Chemiker Zeitung*. Evolution of hydrogen during deposition of chromium and its absorption in the metal cannot be avoided. As the hydrogen readily diffuses from the chromium into the nickel, the capacity of the latter for the gas may easily be exceeded. This results in brittleness, non-adhesion and in peeling, either during the plating of chromium or soon afterwards. To deposit a nickel coating as low in hydrogen as possible, the author recommends the use of baths which give a sufficiently strong and ductile product, low in hydrogen, which is adaptable for subsequent chromium plating, even with the use of high current densities. Insufficient removal of grease from brass before application of the nickel also causes blisters in the chromium plating.

Armstrong Seadrome Will Require 15,000 Tons of Steel

THE Armstrong seadrome, a floating landing field to aid transatlantic air navigation, will require about 15,000 tons of structural steel and plates. About 9000 tons of pig iron or other suitable ballast material also will be used. Estimates are now being taken on the cost of building the first of the Armstrong seadromes. It is possible that the work will be divided between the Sun Shipbuilding Co., Chester, Pa., and the Belmont Iron Works, Philadelphia.

An accompanying illustration shows a working model of the seadrome. This model has withstood tests in which heavy storm conditions have been simulated. The actual seadrome will be 1100 ft. long and 340 ft. wide. Its legs, which are for anchorage, will extend downward 252 ft. The platform will be 80 ft. above the normal water line.

During the tests, some of which effected conditions of waves up to 180 ft. high, the seadrome model remained practically level, without pitch or roll, according to the inventor, Edward H. Armstrong, an engineer with E. I. Du Pont de Nemours & Co., Wilmington, Del. Henry J. Gielow, Inc., naval architect, New York, has worked on the plans for the anchorage. An anchorage cable 21,150 ft. long will be used.

When the first seadrome has proved itself practical, others will be built so that a chain will provide landing fields about 400 miles apart across the Atlantic Ocean. The first one will be anchored midway between New York and Bermuda.

These seadromes will be equipped with various facilities such as small hotels, gasoline filling stations, repair shops, etc. They will also have radio apparatus, enabling them to keep in touch with airplanes at sea.

The designers say that these seadromes will remain virtually stationary during the heaviest storms at sea. Airplanes will be able to land on their decks, refuel and take off again.

Mr. Armstrong has been working on this project for years and has had the advice and cooperation of such organizations as the General Electric Co., Radio Corporation of America, John A. Roebling's Sons Co. and the Sperry Gyroscope Co.

CARNEGIE LIBRARY OF ATLANTA

Lubricating Problems in Rolling

Water Introduces Detrimental Factors—How Various Types of Mills May Be Adequately Greased

DISCUSSION of lubrication in the presence of water occupied the September number of *Lubrication*, published monthly by the Texas Co., New York. Essential characteristics of lubricants were outlined and then their application to various types of equipment, with water splashing over the bearings, was entered into in some detail. What was said about conditions in steel mills is covered in the following paragraphs.

Water on Roll Drives Causes Trouble

In steel plant service hot water or steam conditions will frequently prevail in the blooming mill as well as on certain other rolling machinery. This is because it is often found necessary to run water constantly over the rolls and roll necks for the dual purpose of cooling and blowing off scale as ingots, bars or billets are broken down.

Some mills, in addition, blow steam directly on to the ingot during its first pass through the rolls, to remove the scale more effectively. Such conditions, coupled with the extreme heat which is constantly encountered, place a most exacting requirement upon the roll-neck and gear lubricants. These must, therefore, be compounded products, inasmuch as straight mineral lubricants cannot withstand the continued washing action of hot water.

The usual procedure is to compound the gear lubricant with definite percentages of certain substances which will give the final product the desired adhesive properties. Any rolling mill gearing, however, which does not come in contact with water can readily be lubricated with a straight mineral gear compound, of a viscosity ranging from 2000 to 5000 sec. Saybolt, according to temperature conditions and the manner of lubrication.

The pinions adjacent to the roll necks in the blooming mill are usually inclosed in an oil-tight casing. In this event they are run in a bath of specially prepared gear compound of high adhesive characteristics, having a viscosity of about 2000 sec. Saybolt at 210 deg. Fahr.

In some installations, however, these pinions may be only covered with shields which are not oil-tight. Where this is done there is often no bottom to the gear case; therefore, bath lubrication is out of the question. Hence the lubricant must be able to stick tenaciously to the pinions over the periods which intervene between applications, and maintain a sufficiently protective film. A viscosity of about 5000 sec. Saybolt at 210 deg. Fahr. has been found to be necessary to make the resultant lubricating film able to withstand the terrific pounding and hammering which occurs, especially when the mill is reversed.

Continuous Mills

Rolls of continuous mills are usually driven by herringbone pinions and a set of relatively heavy gears. These pinions in such a mill are often so constructed as to make it necessary to lubricate the bearings with grease and to maintain a continuous flow of cooling water over them.

Naturally this water will splash on to the pinions (where exposed), involving a condition and requiring a grade of lubricant such as was mentioned in discussing the blooming mill. Certain mills, however, may be built with oil-tight gear cases and suitable shields which will permit bath lubrication. This, of course, is the admirable condition, for the utmost of protection is afforded both the lubricant and the gear teeth.

Table Rollers

Bevel gears which drive the table rollers nearest to any rolling mill frequently operate exposed. They are, therefore, subject to water conditions, flying scale and the heat which radiates from the hot metal in its course through the plant. Here the gear lubricant is difficult to apply, in the first place, and, furthermore, after it has been applied, there is every obstacle put in the way of its functioning effectively. Centrifugal force will tend to throw it off, especially where it has suffered any extensive reduction in viscosity, due to overheating.

The washing action of the water which splashes over such gears is a detriment also. In addition, excessive contamination by solid foreign matter can hardly be avoided, unless precaution is taken to guard such gears effectively. Ultimate protection can be attained, therefore, only by frequent applications of a lubricant which has been so refined as to withstand these detrimental conditions.

Usually the same product as recommended for the blooming mill gears must be used, having a viscosity of from 1000 to 2000 sec. Saybolt at 210 deg. Fahr., according to weather and temperature conditions. It should be applied by pouring on to the teeth at the point of mesh while the gears are running inward.

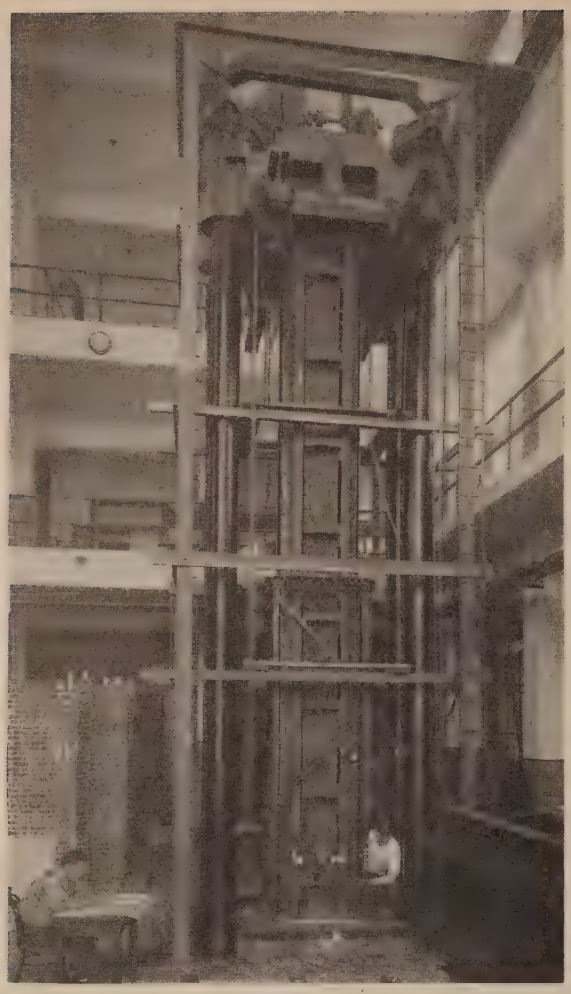
Salt on Plate Mills Detrimental

Plate mills present an additional detrimental condition, from the quantities of de-scaling salt which are thrown on the plates during rolling, and also from the red hot plates passing directly over bearings and gears of table rollers.

Often water is sprayed on the rolls in addition. These factors, coupled with flying scale and dust which is driven with considerable force when the hot gases explode, tend to destroy any lubricant used on the roll necks, table roller bearings and gears. Gear compounds as specified above, however, have been found to withstand these detrimental elements quite satisfactorily, if applied at frequent intervals and in sufficient quantities.

Here an additional property which the gear lubricant must possess is an ability to resist being thinned out by the oil which is used on the pinion bearings, inasmuch as a good deal of this latter will often work out and go on to the gear teeth, especially in older types of mills.

Roll necks must be lubricated with a specially compounded roll-neck grease that will not carbonize nor wash off when in contact with the water run over them to keep them cool. Lubricants used on such roll necks are termed cold-neck greases. In general, they are tallow-mineral oil compounds, often being so prepared as to emulsify on contact with water. Frequently, however, water is not used. Even where it is, the necks may run so hot as to melt down a cold-neck grease. In such cases a hot-neck grease must be substituted, despite added friction and wear.



Hudson River Bridge Column (Half Dimensional Size) in 10,000,000-lb. Testing Machine Ready for Test

Test on Large Structural

EXTENDED use of so-called structural silicon steel and of medium manganese structural steel by the Port of New York Authority has already been noted in THE IRON AGE.* Approximately 33,000 tons of the former has been bought for tower, floor and anchorage members of the 3500-ft. suspension bridge over the Hudson, and 5500 tons of the second named will go into the 1675-ft. arch to be built over Kill van Kull, nearly all into the bottom chord.

Extended studies of these steels (as well as other more common materials of construction) are being made by the bridge department of the Port Authority, including tests to destruction of half-size fabricated members. Some preliminary results on the strength of large columns fabricated of three types of steel are now available, and give a direct comparison of the different steels as they would be expected to behave in a bridge.

For this work the 10,000,000-lb. testing machine at the United States Bureau of Standards, Washington, was used. Six columns were 24 ft. long, about 160 sq. in. in cross section, and dimensionally one-half size specimens of the base columns of the towers of the Hudson River suspension bridge. Two others were dimensionally one-half size of a representative member of the lower chord of the Kill van Kull arch bridge. The six first mentioned were identical in size and make up, except that two were fabricated of ordinary structural steel, two of the so-called structural silicon steel, and two of a new type of medium manganese steel known as carbon-manganese structural steel. (The main web plates of the latter specimen columns were reduced in thickness slightly to keep within the capacity of the testing machine.) The Kill van Kull specimens were of the third type, viz., medium manganese steel.

*Aug. 25, 1927, page 466, and June 13, 1929, page 1643.

Specifications for the Three Types

Physical specifications for the three types contain the following principal requirements:

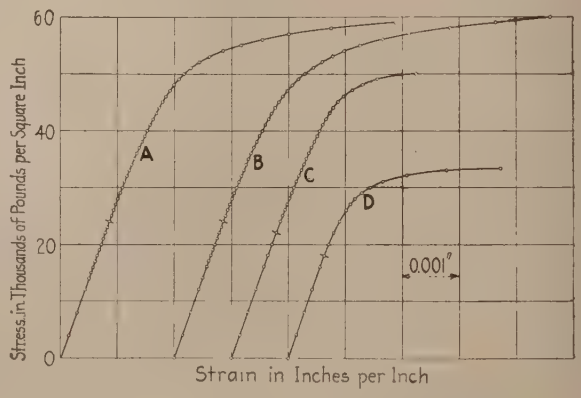
	Carbon Steel	Silicon Steel	Manganese Steel
Tensile strength	58,000 to 68,000	80,000 to 95,000	90,000 or more
Yield point, minimum	35,000	45,000(a)	55,000
Reduction in area, minimum(b)	42	30	30

(a) Average for each group of 10 heats must be at least 47,000 lb. per sq. in.

(b) Sections over ¾ in. thick may be slightly less ductile.

In all types the material, ¾ in. thick or less, must bend 180 deg. without fracture about a pin whose diameter is equal to the thickness of the test piece. Elongation in 8 in. must also be greater than the figure derived by dividing 1,500,000 by the ultimate strength, with certain allowances for plates or sections thicker than 1 in. for the silicon steel and ¾ in. for the other two varieties.

Chemical specifications for silicon structural steel are as follows: carbon less than 0.40 per cent, phosphorus less than 0.04 per cent, sulphur less than 0.04 per cent and silicon between 0.20 and 0.45 per cent.



Stress-Strain Curves of Large Compression Members

A is half dimensional model of section of Kill van Kull arch, made of medium manganese steel; proportional limit of model is at 24,000 lb. per sq. in.

B, C, and D are half dimensional models of columns for towers of Hudson River suspension bridge, identical except for type of steel used. B is of medium manganese steel; proportional limit of model is at 24,000 lb. per sq. in. C is of structural silicon steel; proportional limit of model is at 22,000 lb. per sq. in. D is of ordinary structural steel; proportional limit of model is at 18,000 lb. per sq. in.

Columns of Alloy Steel

Medium manganese steel is to analyze as follows, for shapes and rivets:

		Structural Steel	Rivets
Carbon	Preferably, not over	0.35	0.30
	Maximum	0.40	0.35
Manganese	not over	1.80	1.80
Phosphorus	Acid steel, not over	0.05	0.04
	Basic steel, not over	0.04	0.04
Sulphur	not over	0.05	0.045
Silicon		0.10 to 0.30	0.10 to 0.30

Check analyses are made by the Port Authority from finished material representing each melt. If the results of such check analyses show an excess beyond the limits specified of more than 10 per cent for carbon or silicon, 5 per cent for manganese and 25 per cent for phosphorus and sulphur, it is cause for rejection. The sum of the carbon and manganese content on check analyses should preferably be less than 2.05 per cent.

Large Columns Tested to Failure

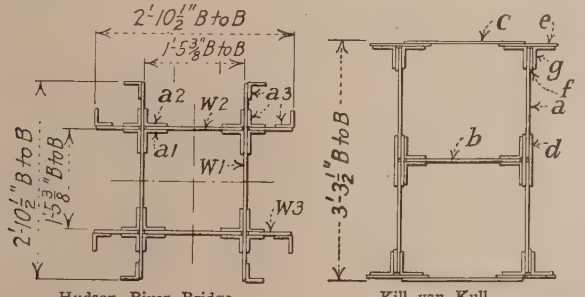
Cross sections of the columns (diaphragms not indicated) are shown herewith; also some representative views of the tests. One view of the test in progress shows the steel scaffold surrounding the entire testing machine to enable the observers to reach any part of the column, and a special latticed structure built close to the column, which served as base lines to determine deflections and any tendencies toward geometrical distortion during test.

Total compression was measured by a group of 16 micrometer dials, built into compressometers 20 ft. long, four for each face of the Hudson bridge columns. The picture shows two of them on the edges of the outstanding flanges and two on the reentrant angles (one obscured in the view). In testing, the load was increased by increments and held stationary until all observations were made. This routine was continued step by step until the total deformation overran the range of the measuring instruments, which approximated the maximum carrying capacity of the column.

Typical Failure After Severe Over Stressing All Test Columns of This Design, Irrespective of Material Used

At that time a series of load-time measurements were made to determine whether the "pick-up" phenomena were present. "Pick-up" is a term used to designate a progressive strengthening of a column after long continued loading beyond the stress which causes considerable deformation. It is associated with a change in the modulus of elasticity at stresses beyond the proportional limit. In these tests the carbon steel columns showed 3200 lb. per sq. in. "pick-up," the silicon steel columns 3000 and 1900 lb. per sq. in. respectively, and the manganese steel columns did not show the phenomenon.

Some results of the tests are tabulated. Stress-strain curves are shown; curves for duplicate columns are nearly identical.



Hudson River Bridge — Kill van Kull

Elastic Limit of Columns Much Below Yield Point of Tension Specimens

It will be observed that the true elastic limit of the fabricated column (or at least that load where the linear relation between stress and strain undoubtedly ceases) is very much lower than the minimum yield point called for in the specifications. The latter figures are more nearly approximated by the stress at which failure as a column commenced. These columns were relatively short (ratio of length to least radius of gyration being 28.9 and 23.7 respectively), so there was no marked deflection of the

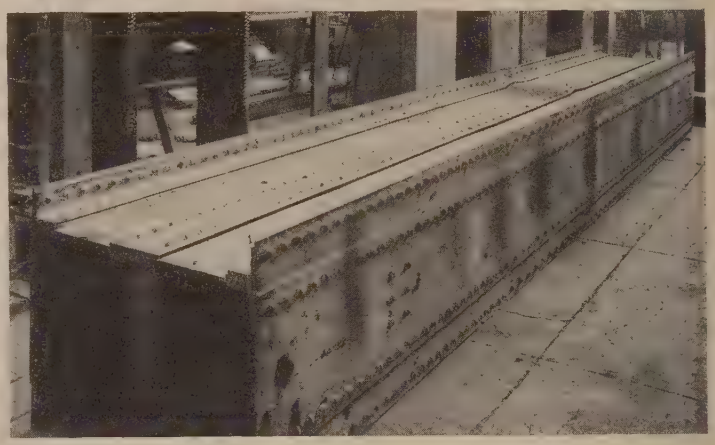
column as a whole until ample evidence had developed that the column was at the point of failure.

Mill test coupons were taken from each rolling of angles and plates used in the fabrication of the test columns, and the anticipated yield point of the whole column, as figured from the weighted average yield point of such test pieces, is given in the table. It will be noted that the carbon steel columns failed at about 84 per cent of the calculated yield point, the silicon steel columns at about 96 per cent, and the manganese steel columns at 99 per cent or better.

Careful observations during the tests indicated the plates or angles which failed first, and thus gave an opportunity to adjust the design of the bridge member to secure maximum efficiency of the sections. These details are beyond the scope of the present article, which is primarily written to show that the use of silicon and manganese steel in box-section columns will result in members having a much greater load-carrying ability than if made of the conventional carbon steel.



Buckling of Cover Plates in Medium Manganese Steel Column, Half Size Those to Be Used in Kill van Kull Arch Bridge

The investigation was supervised by O. H. Ammann, chief engineer of bridges, and Robert S. Johnston, engineer of research and tests for the Port of New York Authority, with the help of the United States Bureau of Standards, especially of Dr. A. H. Stang of the bureau staff.

Izett Steel—What It Is and How Made

WHEN the German liner, the Bremen, made its first appearance in New York, statements appeared in the daily press that the boilers were made of a new steel known as "Izett," coined from the German letters *I* and *Z* which stand for the two German words "immer zähe" which mean "always tough." The statement was also made that this steel is to be manufactured in the United States, under Krupp patents, exclusively by the Central Alloy Steel Corporation. Outstanding characteristics of this steel were pointed out that it does not become brittle when cold worked and that it prevents formation of cracks, especially in rivet holes and at rivet heads.

Investigation of boiler failures was traced to aging of the steel in the field; in other words, becoming brittle. This aging phenomenon reveals itself in a considerable decrease of the ability to withstand deformation. In numerous cases it was also found that the failures of boilers were aggravated by the influence of alkaline feed water. Investigations disclosed that the sensibility of the steel to brittleness under the influence of alkaline feed water was closely connected with this aging phenomenon. The process of aging presupposes that a steel sensible to aging has been submitted to cold deformation which, however, is obviously unavoidable in the manufacture of boilers.

When inquiries were instituted by THE IRON AGE to learn just what this new steel was and how it is made, immediate results were unsuccessful. As a result of further inquiries the following statement states the facts as near as they can be learned:

The new product is not an alloy steel; it is a carefully made open-hearth steel. In conjunction with exercising the utmost care in making a high-grade product, the steel is thoroughly "washed" with manganese during the melting process. It is then killed with aluminum so that in the final product there is about 0.02 per cent aluminum in the steel. Samples of this steel after rolling are tested in a tensile testing machine and annealed at 200 deg. C. The test should show stress lines after suitable etching and is used to show that steel so treated has the same notch toughness as the same steel untreated, thus indicating that the steel is anti-aging.

The story goes that when certain German metallurgists heard of some American and British boiler steels which had unusual properties as to cracking and resistance to boiler corrosion, comparisons were made of these steels with some of the German products. A distinct difference was found between the German steel and the American and British. As a result of careful studies, the new Izett steel was produced.

Flash Welding Simplifies Production

All-Steel Body Made of 17 Major Parts Instead of 300—Spot Welds Reduced from 1050 to 125 by Coordinating Design to New Manufacturing Method

A GREAT reduction in the number of welding operations required to build an all-steel automobile body is emphasized by Joseph W. Meadowcroft, assistant works manager, Edward G. Budd Mfg. Co., Philadelphia.* Some 15 years ago his company's production consisted entirely of touring car bodies, and the amount of welding required was:

Electric spot welds	1000 to 1100
Oxy-acetylene	70 to 80 in.
Metallic arc	10 to 12 in.

Continual study on simplification and adaptation of design to constantly improved machinery has changed these figures materially. At the present time the whole side of a sedan body is formed from a single sheet of steel, as described in THE IRON AGE, Sept. 13, 1928. The body, therefore, consists of four major units, viz., right side, left side, rear and cowl. The first three mentioned are joined in a large flash welding machine; views of it and the finished weld before smoothing are shown.

This new construction requires the following amount of welding for each complete closed body:

Spot welds	125
Gas welding	42 in.
Metallic arc weld	4 in.
Electric flash weld	216 in.

Evolution of the center door post from a part made up of a multiplicity of small pieces spot welded together, and at times difficult of access by the welding dies, to the modern one consisting of two pieces only with flanged edges spot welded and crimped over. The first design also shows the influence of the composite structure (wood skeleton and sheet steel cover) in the heavier load carrying members and the light sheet metal outside panels. The latest construction is so arranged that the highly finished sheathing takes its share of the stresses—in fact, is an integral part of the structure. This makes for economy in the welding and lessens the weight of steel.

*"The Importance of Welding in the Production of All-Steel Automobile Bodies," a paper read before the World Engineering Congress, Tokio, Japan.

Automatic Heat-Treating Unit

Three Interconnected Furnaces in Studebaker Plant Have Great Flexibility in Use—Save Much Labor Cost

BY W. M. HEPBURN*

A UNIVERSAL heat-treating unit has been installed at the recently expanded and modernized plant of the Studebaker Corporation, South Bend, Ind., for normalizing, hardening, quenching and drawing.† These functions may be separated for various heat treatments, according to the requirements of production.

Flexibility in a wide range of heat treatments is paralleled by flexibility as to size of work. All kinds of forgings, from the smallest to large axles, are treated interchangeably by altering the time cycles and temperature gradients of the various units. The range in size is possible because a standard grid type tray, of alloy steel and 14 in. wide, is used to carry the work through.

With this method the work will travel through all three furnaces and the quench automatically and continuously, with the attention of but two operators. One loads the work on to the trays at the charging end of the first furnace and the other reloads the work as it emerges from the quench, preparatory to going through the drawing furnace. This heat-treating unit was developed and built by Surface Combustion Co., Toledo, Ohio.

Brick construction throughout was used in the furnaces, 9 in. of firebrick and 9 in. of insulation being used. The drawing furnace is 26 ft. long and the other two 20 ft., all three being 6.5 ft. wide and 3.2 ft. high. The heat gradient is obtained in each furnace by dividing it into three zones, preheating, heating and soaking. A separate automatic temperature control is located in the heating and soaking zones of each, with recording pyrometers.

These furnaces are fired with both gas and oil, gas burners being used in the soaking zone, where accurate heat control and perfect heat distribution are necessary. The oil burners are in the heating zone, where maximum heat input is required. The products of combustion pass toward the charging end, giving up considerable heat to the cold incoming work, thereby increasing the efficiency of the furnace.

Another point of efficiency is the recuperator. Waste heat from the furnaces passes out through a vent in the roof, close to the loading end, in which the recuperator is placed. Fresh air for oil combustion is forced through a coil in this recuperator, where it is heated to about 600 deg. Fahr., and then delivered to the oil burners.

On the hearth of each furnace are four alloy steel rails. The trays of work are pushed through on these by a mechanical pusher, which is motor-driven through a bell-crank link drive. The length of the period the work

*Surface Combustion Co., Toledo, Ohio.

†This is similar in many particulars to the universal heat-treating unit in the Packard plant, described in THE IRON AGE of Sept. 12, page 663.

NORMALIZING, Hardening and Drawing Furnaces, in Line, Viewed from Charging End. Above will be noted the overhead conveyor for returning trays, delivering them at left of illustration.

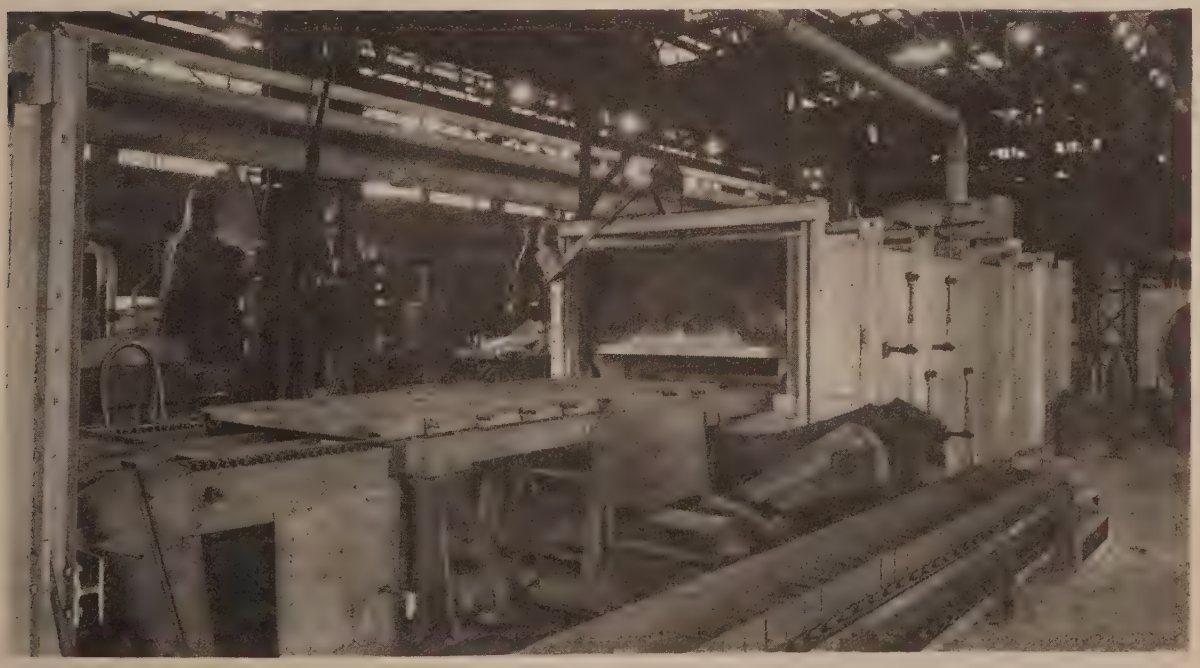
Drawing, Hardening and Normalizing Furnaces, from Discharge End. At right is noted the discharge of a cross-conveyor into tote box

remains in the furnace is regulated by the frequency with which the pusher operates; this, in turn, controlled by a time clock.

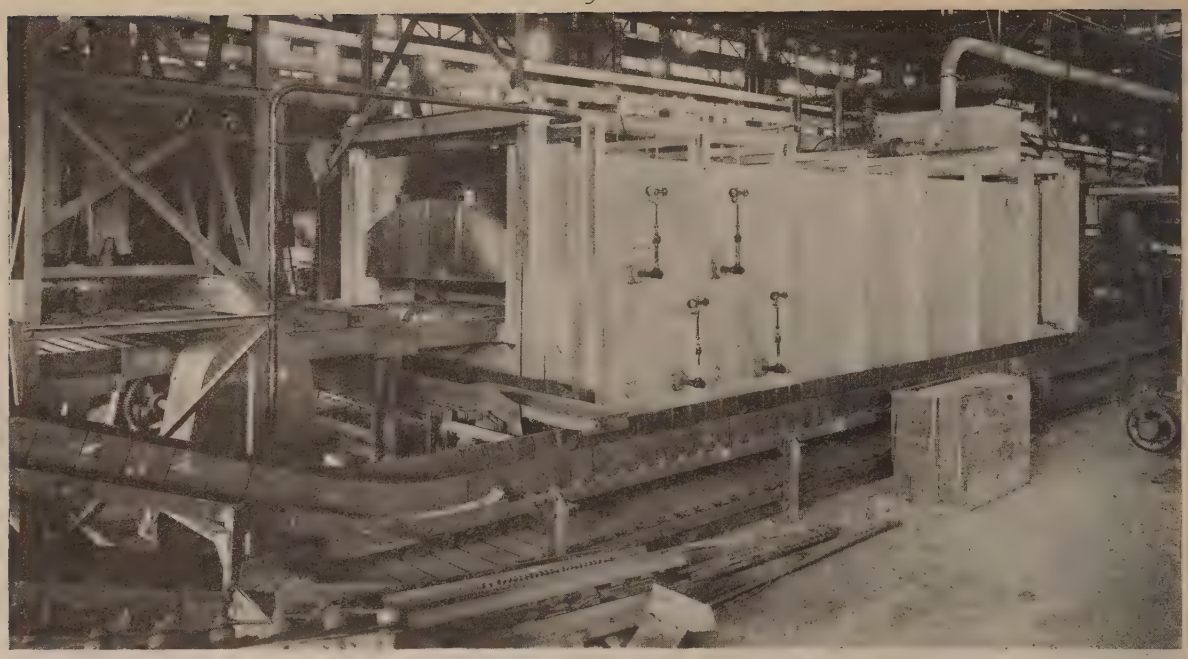
A mechanical puller reaches into the furnace at the discharge end, engages the trunnions on the trays and pulls them forward. This puller is operated by the same time clock as the pusher, in series with a relay to correct for the time lag between the two. The puller is auxiliary to the pusher, as it is not practical to put all the load on the latter. The pushers and pullers on all three furnaces can be controlled from the same time clock, with the relays mentioned, when all furnaces are being used in combination heat treatment.

When the normalizer is used alone, separately from the other furnaces, the work is automatically dumped on to a traveling cooling conveyor at the discharge end. It is carried along for about an hour, when it is dumped automatically into tote boxes for further handling.

If hardening and drawing are to follow the normalizing, the trays of work are pushed along the crossover conveyor between the normalizing and hardening furnaces, and into the latter. This crossover conveyor is of the



Discharge End of Normalizing Furnace. Several of the trays, on crossover conveyor, indicate their design, with trunnions at leading edge. The cross conveyor, delivering to cooling conveyor in foreground, is for work which does not require hardening or drawing



Discharge End of Drawing Furnace, With Elevator for Empty Trays at Left. Cooling conveyor is in foreground

roller type; its 22 ft. of length allows for proper cooling before hardening.

At the discharge end of the hardening furnace the work is dumped through a chute into the quench tank. A slat-type conveyor brings it out of the quench to the loading platform for the drawing furnace, where an operator reloads it again in the trays. These trays have trunnions, one on each end and both on the advancing side. The trays ride on the rails through the hardening furnace to the discharge end; here the trunnions ride up on to short rails in the side of the furnace. As the trays leave the supporting rails they upset and, swinging by the trunnions, allow the work to slide off into the quench.

The trunnions of the trays are engaged, before dumping, by the puller, which pulls the trays out on to another conveyor bridging the space between the hardening and drawing furnaces and places them in position to be reloaded.

Similar to the others except that it operates at lower temperature, the drawing furnace next receives the work, which is pushed through as described. At the unloading end of this furnace the trays are pulled out and the work is dumped on to a slat chain conveyor for cooling. At the end of this the work is dumped off into the boxes for further handling.

After dumping, the trunnions of the trays are caught by dogs on two parallel moving chains which carry them up and over the furnaces, back to the charging end of the normalizing furnace. Here they are dropped on to another dog chain conveyor which brings them up to the charging table.

These furnaces are used to heat treat such parts as connecting rods, steering knuckles, steering knuckle arms, steering arms, etc. Precise control over the material going into these parts and over the heat treatment of them is maintained through inspection and laboratory checks.

Does Overstress Increase or Decrease the Endurance Limit?

THERE seems to be doubt whether moderate overstressing will or will not decrease the endurance of steel to alternating stresses. Prof. H. F. Moore of Urbana, Ill., has cited tests to show that it will; Messrs. Smith, Connor and Armstrong described some experiments indicating the opposite in a paper entitled "Correlation of Fatigue and Overstresses" read before the recent meeting of the (British) Iron and Steel Institute.

The latter authors' experiments were of the "short-time" variety; a specimen is loaded in rapidly alternating tension and compression, a further direct stress is then superimposed upon it, and the relation between this direct stress and the resulting strain is measured. By increasing the superimposed strain gradually a definite yield point can be found, and experience with the method for 20 years convinces the authors that this yield point corresponds with the limiting fatigue range.

Samples cut from a 0.19 per cent carbon steel were placed under various alternating stresses, including those where the mean stress was zero and those where it mounted up to 30,000 lb. per sq. in. tension, and the same value in compression. For several such conditions the yield range was established. The work was then repeated on samples which had been overstressed 10,000 to 20,000 cycles, and the yield ranges on such overstressed samples were always greater than corresponding results for the steel in its primitive state.

The conclusion that overstress increases the endurance limit (yield range) of steel is fortified by experiments on a 6-in. steel railroad axle (0.37 per cent carbon), which failed by fatigue at each end after about 35 years' service. Samples cut from the surface had a yield range (zero mean stress) of plus or minus 36,000 lb. per sq. in., whereas samples cut from near the center, where the working stresses were quite moderate, yielded at 33,300 lb. per sq. in.

Steel Making Practices Reviewed

Many Questions of Quality Control, Combustion, Mechanical Equipment and Furnace Design Taken Up by Open-Hearth Men

MORE than 130 men were in attendance at the Open-Hearth Committee meeting of the American Institute of Mining and Metallurgical Engineers, held at the Hotel Stevens, Chicago, Nov. 5 and 6. This was much the largest representation of steel men which has been gathered together during the five years of these semi-annual meetings.

Four half-day sessions were held, each devoted to a "round-table" discussion of a general topic of importance to steel makers. Leo F. Reinartz, assistant general superintendent, American Rolling Mill Co., Middletown, Ohio, and chairman of the conference, presided. No set papers were presented, aside from a few committee reports, which were brief.

Preference Between Mixers and Mixer Ladles

METAL mixers were compared with Pugh mixer ladles in a number of ways by several speakers. In one instance two Pugh ladles of 125 tons capacity were used in an open-hearth department making 60,000 tons of ingots a month. These ladles were running about 50,000 tons of iron between linings, and the cost of the new lining was from $800 to $1,000. Practically no skull loss was experienced except a little around the neck, which amounted to about ½ per cent.

Preference was expressed in this case for a mixer, because it gives the opportunity to get a better mix in the metal. However, as the plant in question has only one blast furnace, the Pugh ladle is used, as it was cheaper than to install a mixer.

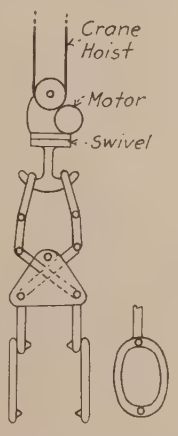
Another plant making 150,000 tons of steel a month uses four 100-ton Pugh ladles and also a mixer. The Pugh ladles give much less scrap loss, running to a difference of about 3 lb. of runner scrap and 17 lb. of ladle scrap for a ton of steel. This plant reported 83,000 tons of iron in the Pugh ladles between linings.

Carrying Molten Iron 11 Miles

Three Pugh ladles are used in one case to transport molten iron 11 miles from a 550-ton blast furnace, making six casts a day. There is very little heat lost and the skulls are a minimum, being not over ¼ per cent in the transfer ladle. To this must be added ½ per cent of kish, making a total loss of ¾ per cent. These ladles are running 40,000 tons of metal to the lining.

Another plant using four 60-ton Pugh ladles gets its molten pig iron from a separate company. Scrap loss is believed to be less with these ladles, but the independent source of iron makes it difficult to get hot metal at all times when wanted. It is impossible, under these conditions, to mix irons of different analyses. In this case the silicon limits are from 0.80 to 1.30 per cent. The belief was expressed that the Pugh ladle is ideal for small tonnages.

Cost of a 650-ton mixer in 1916 was reported by one operating man at $160,000. This did not include the building or the cranes. In another case a 600-ton mixer was installed for $150,000, including the building. No crane was installed, as the arrangement was such that the open-hearth crane could cover the mixer also.



ARRANGEMENT of Automatic Tongs with Auxiliary Loops and Extra Bits

Value of Automatic Couplers

AUTOMATIC couplers have been installed in some of the plants because of their greater safety in operation, compared with the open link and pin. This applies to both charging buggies and ingot cars. Some plants have used the automatic couplings from the beginning. Usually these are smaller than the standard railroad size. In one case where the scrap charged is light, and there is a great deal of switching and use of the buggies, the couplers are practically necessary in getting the work done.

Another plant, however, reported having gone back to the use of links and pins, after having used a number of cars some years ago with couplers on them. It was found that the two types would not work well together.

In another plant where the links gave some trouble it was found that they were too long. The difficulty was overcome by use of shorter links. With automatic links on ingot cars, it is customary to lay a wooden block across the couplers to take care of the possibility of trouble from a running stopper.

Use of Automatic Tongs

SEVERAL plants reported using one form or another of automatic tongs, similar to those used on a stripper, for picking up both ingots and molds. In some cases a special crane hook is employed which has both the sharp bits for handling ingots and loops for picking up molds by the ears.

This equipment has been found available for setting the molds on the ground as the ingots are stripped, for turning molds over to clean them and then for setting them back on the stools. This device saves a lot of labor in handling both molds and ingots, but is not fully automatic.

In general, the arrangement will be shown by the sketch. The hook is mounted on a swivel operated by a motor and capable of handling 14,000 lb. The loop for molds sets below the bits used for picking up ingots, and is in the way when ingots are lying flat on the ground. Hence a second pair of bits is inserted at the bottom of the loop, to take care of this emergency. The cable coming down in the center disengages the bits or the loops after they have done their work.

One plant reported that the men would not use automatic tongs, because of the time required to swing them into position. It was felt better to use a helper to put light tongs into place. Another plant, however, stated that the automatic tongs are absolutely essential for handling red-hot ingots which happen to be knocked

over at a point outside the building, where men cannot get close to them.

Best Size Mold for Large Slab Ingots

ANSWERING the question as to the size of mold best suited for making ingots of about 12,000 lb., for rimmed steel, one man reported the use of molds measuring 21½ x 40 in. in section for 14,000-lb ingots. He believes that 80 per cent yield is pretty good practice on these ingots. There is always more or less segregation in rimmed steel, but not enough to cause loss beyond that noted above. These molds have 1½-in. and 2-in. taper on the two sides, and a corner of 1½-in. radius.

Another plant making ingots of 14,500 lb. uses molds of 21 x 44 in. The ingots are very heavily cropped and no more segregation is obtained than in ordinary practice.

Corrugated ingots came up for attention, one speaker reporting the use of 22 x 24-in. molds for this purpose, with 1 3/16-in. corrugations. He said that these ingots clean up much better than those with flat sides and that they are free from cracks.

This was at variance with a report privately made from another source, in which the opinion was expressed very forcibly that cracks and seams are both almost sure to be present in corrugated ingots. They were said to follow the line of angularity between corrugations.

Furnace Control Equipment

ONE of the most important subjects before the open-hearth superintendent today is that of proper control of combustion. The plant represented by one speaker has only one furnace fitted with automatic equipment. He believes, however, that the operating men on the other furnaces have been helped by the experience obtained in this one case.

Proper amount of air for the fuel burned cuts the cost of operation and results in better steel. No guesswork need be employed with a furnace properly balanced. It is essential to have a fan to supply the air and this should be driven by a variable-speed motor. Under these conditions, analyses for CO_2 show that there is very little excess oxygen present.

This method of operation reduces the fuel consumption and, with less excess air, there is much less waste gas, less scouring of the outgoing end of the furnace by the outgoing gases and a better furnace life. A stack damper works automatically in connection with the air supply to balance the condition in the furnace.

Waste gas analyses are made for O, for CO and CO_2. The samples are taken from the furnace downtakes and the oxygen runs under 1 per cent, after the charging doors have been closed.

In a castings plant considerable auxiliary equipment was reported. An oil indicator gives the number of gallons burned each hour. This runs about 125 during the melting period and 95 while refining. There is also a recording gage with a 24-hr. chart. As the results are always visible to the operating men, there naturally follows a certain competition for low oil consumption between operators of different furnaces.

At the base of the stack the draft runs between 0.3 and 0.4 in. of water. A fan blows the air in and produces a balanced condition. A pyrometer records the stack-base temperature at about 1100 deg.

Some 12 per cent of CO_2 is found at the outgoing end of the regenerator. This is believed to be the wrong place for taking these samples, as they should be obtained from the downtake.

An air meter shows that 3200 to 3300 cu. ft. is used a minute on 8 to 10 Baumé oil, registering about 155,000 B.t.u. to the gallon. Oil consumption runs as low as 25 gal. to the net ton of charge, using cold metal. This is on a 25-ton basic furnace. An average of 26 heats showed 27.4 gal. to the ton, in place of 35 to 38 gal. used before the regulating equipment was installed.

This furnace is insulated and covered with steel plate, so that it is air-tight. Since the change was made it has been producing about 26 heats a week, against 24 previously.

Cost of instruments and their installation to give the results above outlined was placed by one speaker at about $3,500. Another man reported no benefit observed in using these instruments, compared with similar furnaces without them.

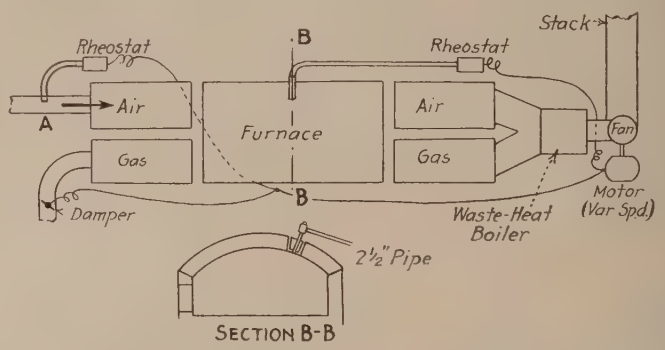
Mixing Two Dissimilar Gases

INSTALLATION of special combustion control equipment in a furnace in eastern Pennsylvania was reported by one speaker, in which a mixing device for blast furnace and coke oven gas has been adjusted to give a constant value of about 500 B.t.u. to the cubic foot. By volume the range of this system is up to 10 or 12 to 1 without changing the ratio between the two gases burned.

To equip one furnace costs about $6,000 to $7,000 for instruments and another $4,000 to make the installation. However, this results in increasing weekly production by about 10 per cent.

In the diagram is shown schematically the way this equipment is hooked up. All that is necessary after the controls have once been worked out and properly set is to change the amount of air coming into the furnace at *A*. The interconnection adjusts all the other elements for proper combustion control. The adjustment in each case is through a rheostat, balanced with a weight, to govern the operating motor.

With this equipment is a master controller consisting of a panel board with several mercury gages on it. Air pressure above the gages is connected with the various controls to the dampers. Below this board is a master wheel to work all of the mercury gages at once, after they have been properly set individually.



Schematic Representation of Furnace and Regenerators, with Control Apparatus. A change at A follows automatically through the system

Another speaker reported using equipment for keeping the regenerator chambers in balance with each other. The maximum-temperature method is employed, as in the Isley furnace control. When this temperature has been reached a bell rings and a light flashes, notifying the operator that the furnace should be reversed. With this system the difference between outgoing and incoming temperatures is about 85 deg.

Control Usually Advantageous

Local problems account for many differences in practice. One speaker reported, however, that in most cases something is to be gained by mechanical control. The effort is to get apparatus which is so nearly foolproof that the operations will be carried out exactly as the engineers desire.

The first step is to equip furnaces with instruments for automatic combustion control. Air supply, draft conditions and fuel must be cared for. Different plants making differing qualities of steel give varying requirements. As the men learn to use their instruments control can be taken away from the human factor.

One operator believes that balanced reversals do not necessarily balance the length of the flame. For this a flow-meter balance is required.

Two speakers reported the need of an oxidizing atmosphere in melting

down the charge. This produces an oxide of iron used later in reducing the bath. For the refining period, however, as well as for the lime boil, a neutral atmosphere is needed, or even a reducing atmosphere toward the end of refining, with the air practically shut off.

Indicating and recording instruments are reported to be giving good results on a 100-ton furnace started last May. They have helped the operators to maintain more uniform conditions. Fuel and air are so tied together that a satisfactory furnace atmosphere can always be had. The fuel is adjusted until the flue gas analysis is correct and then held there.

Combustion and Its Control

REPORT of the Combustion Committee was read by its chairman, Charles H. Moreland, of the Wheeling Steel Co. The report consisted mainly of extracts from letters received by the committee from the various plants where study has been under way.

Experiments in one plant in which one furnace is using a combination of coke oven and blast furnace gas have been inconclusive, as the management is not satisfied with present results.

On some oil furnaces, which have not had a complete rebuilding in 15 years, one unit made 732 heats and then required only 12 rows of checkers to be taken out. These furnaces are operating with waste-heat boilers. Steam at 130 lb. is used for atomizing. The oil is heated to 160 to 190 deg. Fahr., and with a pressure of 175 lb. The average consumption for the first nine months of 1929 was 47.9 gal. to the ton of ingots.

Sharp Reduction in Fuel Used

A steel castings plant, using oil of 145,000 B.t.u. to the gallon, reported a consumption of about 70 gal. to the gross ton of castings shipped. This represents approximately 10,150,000 B.t.u. to the ton. A definite campaign to reduce this consumption brought it down by about 20 per cent, going to 8,000,000 B.t.u., with no expense whatever for new equipment.

Changes which were made included going from a long, reducing flame to a short, oxidizing flame. There was a reduction in refractory costs and a smaller deposit in the slag pockets. Under these conditions there was a draft of about 0.75 in., leaving the furnace just about to blow out at the doors. The temperature at the outlet at the regenerator chambers was 1350 to 1400 deg. Fahr. On reducing this draft to 0.65 in., the temperature just mentioned went down to 1200 deg. and the fuel consumption was considerably reduced. Lowering the draft still further to 0.53 in., the fuel consumption was brought down to 41.6 gal. to the ton of charge.

Another furnace using producer gas, with a sloping backwall, reported consumption of 470 lb. of coal to the ton of ingots. This is the average from five furnaces using Venturi-type ports. Mechanical agitators in the producer plant were reported as giving much better gas than could be had with hand poking.

Another plant which has ten 75-ton furnaces, but is tapping 62-ton heats is using about 545 lb. of coal, or 7,250,000 B.t.u., for each ton of ingots.

Report on Furnace Design

DESIGN of furnaces according to latest practice was reported upon by G. D. Tranter, American Rolling Mill Co., Middletown, Ohio, as a result of answers to specific questions sent to various plants. It was found, on analyzing the answers, that local conditions in different plants require certain modifications of any general schedule.

Hearth areas were reported to vary from 4.5 to 6.75 sq. ft. for each ton of bath content. These baths range from 27 to 34 in. deep. Roofs vary in thickness from 12 to 18 in. There seems to be a movement toward the more general use of 15-in. roofs with 18-in. ribs at intervals across them.

Adjusting Flow of Burning Gases

Combustion control in furnaces is obtained by setting of the port nose in relation to the position of the knuckles. Water cooling is usual for producer gas ports, but is less common with other fuels.

Air uptakes seem to range for producer gas from 30 to 40 sq. ft. in sectional area, and gas uptakes from 8 to 12 sq. ft. This same total area, when oil is used, is put into a single uptake for the air.

Slag pockets for producer gas are now being made from 6 to 7 ft. in width in front of each regenerator chamber. For oil, a single slag pocket at each end of the furnace is made 10 to 12 ft. wide. The regenerator openings vary all the way from 4½ x 4½ in. to 10½ in. square.

Organization of a Working Force

NO standard working force can be offered for different plants on account of the difference in quality of steel made. High-quality alloy steel takes a considerably larger force for its production than the grades more commonly demanded.

As to a wage basis, however, a definite suggestion was offered by the Committee on Organization and reported by its chairman, H. B. Hubbard, Inland Steel Co., Indiana Harbor. Working it out on the basis of a shop containing 12 furnaces, there would be naturally two groups, each of six furnaces with its own set of melters.

Different Types of Bonus Payment

Salary for the foreman or melter would constitute one-half, approximately, of his earnings. A tonnage bonus for increase of production would constitute about one-half of the remainder, while the rest would be provided as a bonus for economy of operation and quality of product. Working conditions would affect both of the bonus figures so that the proportions, month by month, would not be uniform. These bonuses might be paid monthly or semi-monthly, or on the results of a complete furnace campaign.

For the first and second helpers, day wages would constitute the greater portion of the remuneration. A certain percentage here should be paid on the bonus basis, but it would be a much smaller proportion than for the melter. All other men in the open-hearth department would be paid a day rate, plus a bonus, the latter being a small proportion only of the total income.

Tonnage Basis in Large Use

In discussing this report one company reported that all men in its plant are paid on a combination of hourly and tonnage rates, about half being under each category. In another plant the operating men are paid on a straight tonnage basis, with a bonus for extra tonnage above a certain stipulated amount. The melter, however, has a definite monthly salary, on top of which a bonus is paid. This gives him a decent income, even under poor operating conditions.

Bonus on the life of the furnace roof is paid to the first helper in another plant, in which a tonnage-hour rate is the usual method of payment for both the melter and the first helper. Another plant pays the melter a combination salary and tonnage rate, of which the latter constitutes about 60 per cent of the total. In this plant the first helper and other furnace men are paid a tonnage rate only.

Great Need for Fundamental Research

IN conjunction with the Chicago division of the American Institute of Mining and Metallurgical Engineers, the Open-Hearth Committee held a dinner meeting at the Chicago Engineers' Club on Nov. 6.

After Dr. H. Foster Bain, secretary of the institute, had paid a tribute to metals and their predominant use as a distinguishing differential between the civilized man of the present and the primitive man of the past and of some lands at present, the speaker of the evening was introduced. This was Wilford P. Sykes, assistant general superintendent of the Inland Steel Co.

Mr. Sykes made a particular plea for appreciation of the need of research into fundamental principles. Especially he called attention to the fact that it is difficult to get management to take a long-sighted view of this matter. He stated that we shall make little progress toward better quality in steel making until we have technical men running the furnaces. While "the man at the fire" has done excellent work, he cannot be depended

upon for the finer refinements necessitated by modern demands.

Steel Maker Not Always to Blame

Relations of the open-hearth department to the other departments were brought out rather forcibly by Mr. Sykes in the first part of his talk. This had to do with the blast furnace operations and the coke ovens and, on the other side, with the blooming and finishing mills. Coke is not always good. Although the blast furnace man may complain about it, little is gained unless we can get tests of coke quality which can be made simply and quickly.

When it comes to the blast furnace, there are great variations of unknown origin in the iron, not only from one cast to the next, but between different portions of a single cast. The silicon may vary as much as ½ per cent in one cast. It has become known that the silicon - temperature curve does not hold good in ordinary practice. The open-hearth man should know more than he does about the quality of his pig iron.

In-Breeding of Scrap Not Desirable

There are large and unknown variables in the quality of scrap. If scrap is used over and over again it becomes a sort of in-breeding process, with resulting poor quality in the steel. A prominent English metallurgist claims that all heats of steel should be made with at least 70 per cent of virgin metal.

We may have to spend a much greater amount of money and time in segregating and classifying scrap before charging. This, however, will not be a total loss, as there will be heavy saving in chipping costs to offset this.

Slag Research Urgently Needed

We must learn much more about the properties of open-hearth slags. They are exceedingly complex mixtures of chemical materials and a comprehensive research is beyond the means of the average open-hearth laboratory. Such a task can be undertaken only by large research departments, such as those of the United States Steel Corporation, the Bureau of Mines, or the Bureau of Standards. This will cost a great deal and will take a long time; a ten-year program is not beyond reasonable expectations. It is a matter of great magnitude and requires scientific research of the highest quality.

We must have better tools to aid the melter in his work. One of these tools consists in rapid tests whereby he can learn quickly just what his bath is doing. This will reduce his guesswork on the basis of a fractured test-piece to a minimum. The effect of the temperature of steel when it is tapped is something about which we should know more. It will be necessary to get away from guessing at this temperature, through using pyrometers more generally. The eye is an uncertain temperature guide.

Handling of hot steel in soaking pits may cause grave defects in the finished product. Often these are blamed upon the open-hearth department in its making of the steel. Until we have more information as to how these defects are initiated, we shall have no uniformity of opinion as to what is good heating practice.

Rolling is largely a question of surface condition. The center of the ingot is pulled along by the outside under a definite but unknown tension. If the rolling is carried too far on one side of the ingot, this may cause defects which show up in the finished steel. It is bad practice to spread ingots, in rolling, to greater widths, as this often sets up seams or cracks.

At the Witkowitz plant in Czechoslovakia 10,000 steel plates from 380 heats of steel were analyzed. They showed a considerable quantity of snakes which were mainly caused, it was found, in heating, slabbing, reheating and finishing. The open-hearth department was responsible for very few of them.

User and Maker Should Work Together

Cooperation between the user of steel and its maker will help in obtaining the quality required. At present this cooperation, so far as any effective degree is concerned, is confined mostly to the grades of steel used in the automotive industry. If the steel man knows what the steel is to be used for, he often can work to the desired quality. Without this knowledge, and working from specifications written by metallurgists lacking knowledge of the steel man's problems, the specification may be met but the steel will not necessarily be just what was wanted.

One phase of the matter has had practically no attention. That is a proper statistical analysis and correlation of the results of experience and tests. It may be that the large laboratory of the future will employ competent statisticians to do this very thing. This ought to bring out factors which now we largely overlook.

Visit to Laclede Steel Co.

MORE than 30 of the men at the meeting were carried from Chicago to Alton, Ill., Wednesday night, in two special Pullmans, which were switched into the yard of the Laclede Steel Co. to a position near the open-hearth department. Breakfast and luncheon were served by the company. The visit was for the express purpose of inspecting the new 100-ton open-hearth furnace at that plant, built to the designs of the Arthur L. Stevens Corporation, Chicago. Owing to ladle limitations, the heats being tapped out of this furnace are somewhat below its rating.

Principal among the features is the control of the fuel and the air for its combustion. Once set, the ratio between air and oil is maintained at a constant figure, however much of a flame the operator may carry on his furnace. He has a certain amount of latitude with regard to this ratio, to take care of varying qualities of oil. Customarily, however, this factor can be ignored. The flame breaks at the center door.

How the Fuel Is Burned

Oil is used at a pressure of 50 lb. at the burner, and heated to 160 deg. Fahr. It is atomized by super-heated steam at a temperature of 480 deg. and a pressure at the furnace of 100 lb. The oil used is from 8 to 12 gravity and consumption is reported at about 27 gal. to the gross ton of ingots.

The furnace atmosphere is so well balanced that the draft gages for both ends of the furnace were reading about 0.07 in. of water, negative pressure. A by-pass air valve with a butter-fly valve operates to open up a passage to the stack whenever the stack draft becomes too great. This is continually changing its position slightly, to maintain the draft balance automatically.

This furnace has a bath 14 ft. wide and 36 ft. long at the slag line, and with 27-in. depth from the beginning of the taphole to the metal line. The roof is straight from end to end. The charge is running about 220,000 lb., all cold, to which is added 6800 lb. of burnt lime.

Even Control Easy on Roof

Refractories are running about 1190 lb. of dolomite and 800 lb. of Granite. More than 350 heats have been taken out of this furnace, averaging 10 hr. 24 min. each. Most of the speed is gained during the melting period. It is expected that this run will reach 60,000 tons of ingots. The roof is still in excellent condition, having had one hot patch above the taphole. A new front wall was put in at 27,000 tons.

The regenerator chambers are insulated with 4½ in. of Sil-o-cel brick and encased in steel plate, thus shutting off all infiltration of air. There are 39 courses of checker brick measuring 13½ x 6 x 3 in. The checkers are running at a good white heat, and are reported to be fairly clear of sediment, and there is a very small quantity of slag—about 6 in.—in the slag pockets.

Reversing is manual on a schedule of about 22 min. Record of the reversals is made on a recording instrument, while the temperature gradient in the regenerators is recorded on another Leeds & Northrup instrument.

The superheater for the steam consists, for this furnace, in coils within a drum between the regenerators and the stack. The temperature at this point is about 1100 deg. Fahr. A somewhat different type of superheater is employed in the three other furnaces. Each has a group of bent tubes inserted into the flue itself, and receiving heat as the gases pass through on the way to the stack. This arrangement is reported to give better results than the one on the Stevens furnace.

[*More of the technical discussion of the meetings will be published next week.*—EDITOR.]

Furnace Cooled by Double Auxiliary

Air is Circulated in Built-In Pipes—Further Cooling by Air Blast Through Chamber

BY R. E. COX*

DEMAND for quick turn-over of material in conjunction with modern production methods has necessitated annealing furnaces having variable but controllable heating and cooling cycles. A furnace meeting these conditions yet maintaining high thermal efficiency has been designed, and several are now under construction. It is heated electrically and the design embodies the following features:

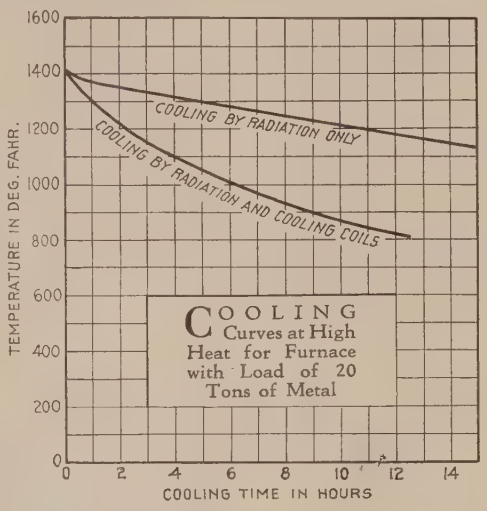
1. Even and efficient heating at such a rate as may be desired in the process.
2. Cooling periods either short or long controlled by the operator according to the method desired in the process.
3. Fast cooling without expensive honeycomb wall construction and without air in contact with work, thereby eliminating oxidation and decarburization.
4. A first grade product in a very short time with unusual economies per ton of material.

Even and efficient heating is accomplished by several points in furnace construction which lend themselves to fine temperature control. The furnace is heated electrically, an exceptionally good type of heat because the units are so distributed as to give uniform and even temperature throughout the furnace. It insures against hot spots and cold drafts and lends itself readily to close control. There are no flues or gas vents through which unnecessary air is admitted or heat lost. The furnace is sealed air-tight during the heating period.

Walls of the furnace are insulated like those being operated continuously at higher temperature. In most furnaces where a rapid cooling cycle is used the furnace walls are under-insulated; this aids cooling, yet gives the inevitable low economy during the heating cycle. With the present arrangement the walls are fully insulated, thus insuring high efficiency and economy of the heating cycle, and the standby losses of the furnace are cut to a minimum.

To reduce the heat capacity of the furnace structure, the chamber is lined with lightweight semi-refractory brick, allowing the walls to heat or cool very quickly, in nearly half the time consumed by ordinary refractories. Much flexibility to the heating and cooling cycle is thus secured and the furnace economy increased.

Adjustable cooling cycles are accomplished by cooling coils and an auxiliary ventilating system, the latter controlled by blast gates sealed tight by insulated doors during the heating period. The cooling coils consist of seamless alloy tubing, formed to allow for expansion and generally installed in the top of the furnace chamber. These coils may, however, be installed in the sides or bottom or both, according to the particular conditions. The tubes are so installed that both ends protrude through the furnace; the inlet end of each tube is connected to a header which in turn is connected to a blower. The outlet end is open to exhaust to the outside air. Thus none of this cooling air enters the furnace chamber. Rate of cooling can be controlled by the amount of air blown through the pipes and by the number of pipes per furnace.



COOLING Curves at High Heat for Furnace with Load of 20 Tons of Metal

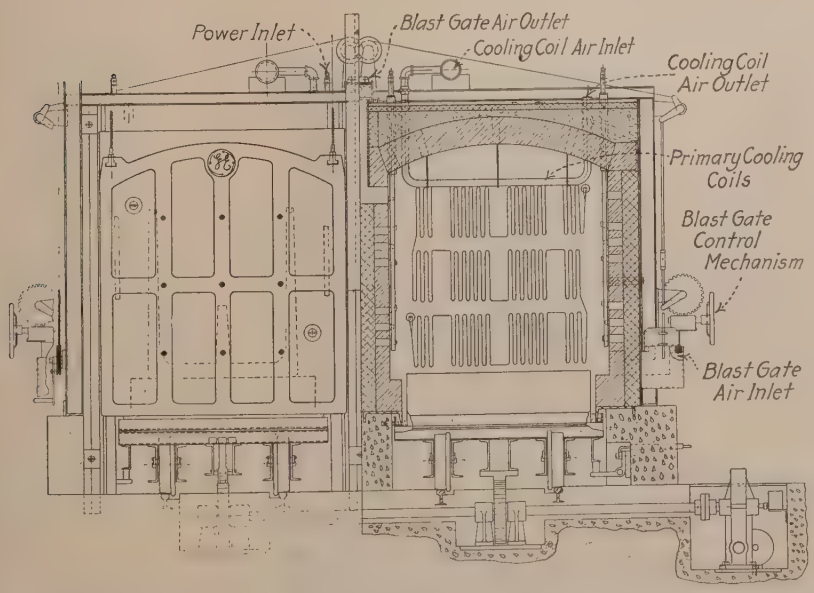
Fast cooling without oxidation or decarburization of the hot metal in the furnace is accomplished by using the cooling coils until the temperature of the load is reduced to about 900 deg. Fahr. Supplementary blast gates are then opened and the load is cooled swiftly to room temperature or to such a temperature that the material can be easily handled.

This supplementary system for rapid cooling in the non-scaling range comprises ventilation holes in the sides of the furnace near the bottom and in the roof. These holes are fitted with insulated covers seated in a sand seal. When closed they prevent heat leakage during the heating cycle and insure a thoroughly tight furnace. These covers or "blast gates" are operated through a system of levers and reduction gears by a hand wheel. This gives a single point control which can be installed at an easily accessible place on the furnace and assures the operator of the exact position of the covers at all times. When set for rapid cooling the outside air enters through the bottom holes, passes through the furnace chamber and out the top holes, the covers being in a raised position.

No special honeycomb wall construction is necessary with this design and, therefore, no complicated repair jobs are necessary.

Of course, the furnace may be left to cool by itself without using either coils or blast gates, but owing to the thickly insulated walls, this would

*Industrial Heating Engineering Department, General Electric Co., Schenectady, N. Y.



SECTIONAL Elevation of Double Furnace with Pipe Coolers for High Heat and Air Blast for Low Heat

require a very long period, as is shown by the curves.

The most interesting features to the manufacturer are doubtless unusual economy per ton of material, fast treating time, and a high grade product.

All the above is made possible by first, a scientific analysis of the steel to determine the best possible heating and cooling cycle, and second, a proper adjustment of the furnace, as described in this article, to the cycle desired.

Slat Conveyor to Turn Corners

Special Design for Use in Constricted Quarters—Handles Tote-Boxes of Materials

WHILE the slat conveyor is a type of equipment which has been in use for many years in handling materials along a straight run, it is an innovation to use that type in turning a sharp or right-angle corner. Such a device, however, has been put into use, as is here illustrated, in a plant manufacturing springs for upholstery purposes. As will be noted, the inner corners of the slats are cut away so that they may have clearance for making the turn.

Previously the work which this conveyor does would have been performed by two separate straight-line conveyors at right angles to each other, the one discharging upon the other. There has, however, been considerable difficulty and annoyance at transfer points of this type.

Taking Off the Corners of the Slats

Hence the idea was conceived, which has taken form in the new equipment, of beveling the slats at one end or at both ends. Instead of carrying them on two strands of chain, requiring both stands to have exactly the same distance to travel from one end to the other, the slats are attached here to a single strand of chain. Attachment is made near the center of the slat and the chain is carried in a vertical plane, with its pins up and down instead of crosswise.

This arrangement permits the slats to be carried around corners in their normal horizontal plane, and at the same time passes the chain over sprocket wheels with vertical axes, or over a series of rollers, permitting a curved path of any desired radius and to any angle which may be necessary.

In this manner the packages may be carried along a path of any amount of crookedness required by conditions, and, if desired, the circuit may be a closed one. A rectangular conveyor might run through a stockroom, going through or passing various bins, and come back to its starting point. An empty pan put on at one point would pass the bins and be loaded, and then returned to the same point where it was put on, filled with the parts necessary to take care of any required orders.

Openings Between Slat Ends Do Not Harm

It is obvious that the surface of this conveyor is not so solid or unbroken as in the case of a straight conveyor. With the latter the slats may be separated by as little as ⅛ in. However, for handling tote-pans, boxes or other packages with flat surfaces, and having sufficient length and width, the opening, as shown in the illustration, will not cause any difficulties in handling the material. Guides at the turning points serve to carry the load around the corners without spillage or piling up.

This equipment was designed and built and put into operation by Mechanical Handling Systems, Inc., Detroit.

New Machine to Polish Metal Specimens

METAL crystals are sometimes large enough to be seen with the unaided eye, but ordinarily they are so small that a microscope is required. Before the metal can be examined under the microscope it must be polished. This, with the hand methods ordinarily used, is a tedious task and requires long experience. It is important, in polishing metals for this purpose, that no pitting occur, since any pits thus produced may be mistaken for defects in the metal.

An automatic machine for polishing metal specimens for microscopic examination has been developed at the United States Bureau of Standards. The machine was designed primarily for use in a study of polishing methods, so as to get reproducible results free from human equation errors. It produces a high-grade polish and should prove of great value in metallographic laboratories.

Polishing is done on revolving cloth-covered disks with alundum powders and aluminum or magnesium oxide as abrasives. In the machine three specimens are polished on one disk so that with, say, three disks, nine can be polished at a time. When a large number of specimens have to be polished, a considerable saving of time compared with hand polishing can thus be obtained.

BY Cutting Away the Inner Corners of the Slats, a Flat Slat Conveyor May Be Made to Go Around a Corner of Any Desired Radius or Angle

New Shaper-Planer

Hydraulically-Actuated Table Drive and Feeds Provide Smooth and Rapid Operation

IN the new shaper-planer recently brought out by the Rockford Machine Tool Co., Rockford, Ill., both the table and the feeds are hydraulically actuated. Compared to the previous design, the new machine has greater power, rigidity and work capacity, as well as finger-tip convenience of control, and exact adjustment of speeds and feeds to suit the requirements of the work.

An Oilgear pump operates a hydraulic cylinder mounted in the bed close up under the table. The piston of this cylinder is connected directly to the table and exerts a maximum pull of 10,800 lb. Any cutting speed desired, up to 75 ft. per min. is instantly available, and the ratio of cutting speed to return is 1 to 3. Table reversal is smooth and shockless.

Hydraulic power for the feeds is provided by a separate pump. There are 20 horizontal feeds, ranging from 0.010 to 0.200 in., and an equal number of vertical feeds, ranging from 0.004 to 0.080 in. Feed takes place after the table returns and before the cut starts. The table and feed pumps, with the pump that supplies oil to the ways, are inclosed in a housing at the rear of the machine, and are accessible through a large door.

Power for raising and lowering the counterbalanced rail and for rapid traversing the head in either direction is supplied by a small motor at the top of the column. Interlocking mechanisms, automatic trips, and shear pins serve to protect the machine against damage. Centralized, sensitive and accurate control is a feature emphasized as contributing to increased productiveness.

The hydraulic table drive removes cross shafts and working parts from the interior of the bed, permitting it to be extra heavy in section and reinforced to withstand the heaviest loads. The ways are scraped to gages and are lubricated by filtered oil under pressure.

The column is keyed and bolted rigidly to the bed. The crossrail is L-shaped with long vertical bearing and narrow guide fitted and gibbed to the front face of the column. The side head and its rail are adjustably mounted on the front of this vertical section. A sturdy box-section brace is bolted and doweled to the crossrail; it reaches back to the rear of the column where it may be clamped on an accurately machined surface. Both rail and side heads are of graduated swiveling type, provided with tapered gibs. The rail head has horizontal and vertical power feeds in both directions, and rapid traverse to the right or left. The side head has vertical power feed and hand horizontal feed.

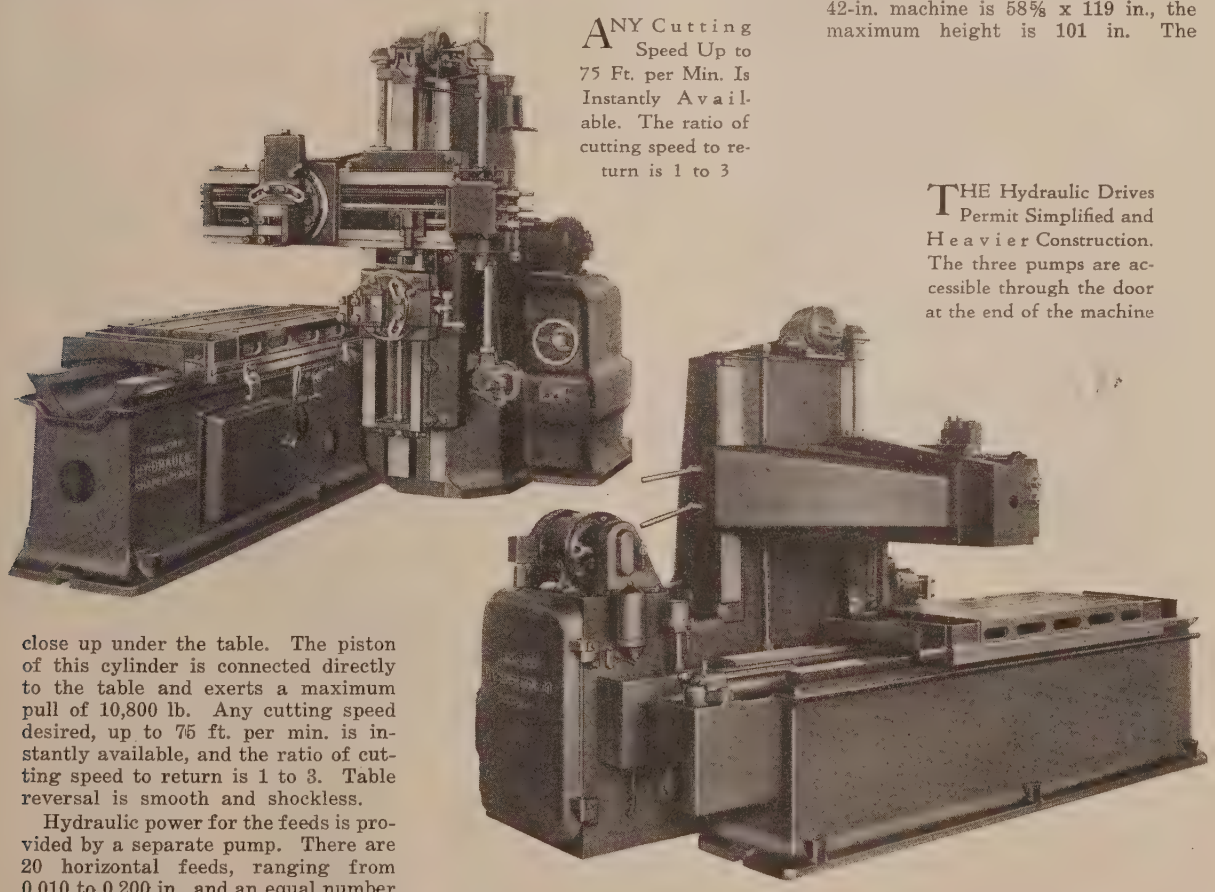
By mounting a grinding head on the crossrail, a reversing cam on the table, and making two simple adjustments the machine may be used for accurate surface grinding. Provision is made for the protection of all finished surfaces on the machine. The table speed, approximately the same in both directions, is correct for surface grinding, and the feed takes place at both ends of the stroke.

Extra equipment available for the machine includes a second rail head, side head, circular planing head, boom crane, shoe and wedge chuck, and driving rod brass planing fixture.

The stroke of table of the standard machine (42 in.) is 43 in., while that of the 66-in. machine is 67 in., and of the 90-in. machine, 91 in. The length of the table is 54, 78 and 102 in., respectively, and the width of table of all machines is 24 in. The maximum distance from table to crossrail is 24 in. Floor space occupied by the 42-in. machine is 58⅝ x 119 in., the maximum height is 101 in. The weight of the standard machine, 42-in., with side head but without motor, is approximately 14,000 lb.

ANY Cutting Speed Up to 75 Ft. per Min. Is Instantly Available. The ratio of cutting speed to return is 1 to 3

THE Hydraulic Drives Permit Simplified and Heavier Construction. The three pumps are accessible through the door at the end of the machine



Correct installation and maintenance of lathes are described and illustrated in a 20-page booklet issued by the Monarch Machine Tool Co., Sidney, Ohio. Subjects include methods of leveling, care and lubrication of the apron and the headstock, adjustment of the driving clutch and motor belts and chain, adjustment of the spindle, and the proper method of changing spindle speeds. A page is devoted to questions and answers to various unusual problems of lathe operation.

Six-Station Vertical Automatic

Adapted for Wide Variety of Work—Operations Speeded by Use of Multiple-Cutting Tools

A SIX-STATION five-operation vertical automatic for high production and long runs of a variety of work is being marketed by the Pratt & Whitney Co., Hartford. Operations performed include milling, drilling, sawing, facing, threading, tapping, hollow milling, reaming, serrating, knurling and boring. Parts to be machined can have holes off center and various machining operations on different center lines can be finished at the same set-up. In addition to flexibility, simplicity of operation is a feature, the only duty of the operator being to load and unload the work and keep the cutting tools in condition.

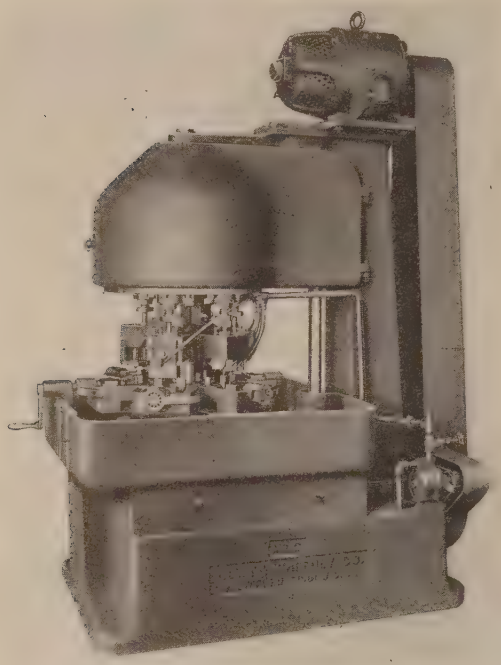
The machine is designed for individual motor drive, with full electrical equipment, including push-button control. A 7½-hp. 1150-r.p.m. motor mounted on top of the column is belted to the drive pulley at the rear of the bed. From the gear box in the bed, power is transmitted to the spindles through a large vertical shaft in front of the column, and a set of change gears in the head. From the gear box the power is also transmitted through a clutch and a worm-wheel to the table mechanism. By means of the two sets of change gears the speeds of the spindles and the table are controlled separately. A friction clutch operated by foot lever stops the movement of the table without stopping the spindle.

Completely inclosed, the gears in the gear box run in oil. Filling of the box is from an oiler at the side of the bed. A pump inside of the gear box supplies oil to the head, which is arranged to supply a drip oil feed to the spindle drive mechanism and the work tables. The same pump also supplies oil for the table driving parts. The only oiling attention required is filling the large gear box reservoir in the bed and the oil cup on each idler spindle. Removable covers at the side of the bed give access to the interior mechanism.

The work tables index progressively from one spindle to another and are locked in each position automatically. Vertical movements of the work during cutting are controlled by cams placed on an oscillating ring under the table. These cams move back and forth, each remaining under its particular spindle at all times. The cam followers are rollers on the lower ends of the six work-table elevating spindles, and move progressively from cam to cam as the work advances from spindle to spindle. The cams may be removed and replaced conveniently.

Power from the vertical shaft is taken to the spindles through bevel gearing, and a large central gear meshes with the separate gear trains for each spindle. Each work spindle has an idler spindle carrying compounding gears, which permits the speed of individual spindles to be controlled over a wide range. The spindles are carried in a large circular bracket and are supported rigidly in sleeves mounted in widely spaced ball bearings. Each spindle is threaded its entire length so that the tools it carries can be positioned vertically and locked in place. During operation the spindles revolve but do not move up and down.

Multiple-cutting tools, such as multiple drill units, combination facing and drilling devices, drills running inside a box mill, etc., can be used on each spindle. Specifications of the machine, which is designated as the No. 2 vertical automatic, are: Maximum distance from flange of work-holding spindle to flange of cutter spindle, with work-holding spindle in lowest position, 14⅛ in.; maximum travel of work, 3½ in.; maximum adjustment of the cutter spindle, 6½ in.; and maximum work diameter swing, 8⅞ in. The speed of the cutter spindles, which are independent of each other, ranges from 150 to 1500 r.p.m. Floor space occupied by the automatic is approximately 40 x 74 in., and the height, not including motor, is 81 in. The net weight, without motor and tooling, is 6750 lb.



(Left) The Vertical Automatic May Be Used for Quantity Machining of Valve Stems, Guide Bushings, Bibb Stems, Spark Plugs, Small Shafts and Numerous Other Parts. The work is advanced and withdrawn from the tools by cam action

(Right) Control of the Furnace Atmosphere Prevents Pitting and Scaling of Material Being Heat Treated

---

Atmosphere Controlled in Heating High-Speed Steel

A NEW patented device which controls the furnace atmosphere, thereby preventing the pitting and scaling of metal parts and tools during the heat-treating process, is a feature of the Hayes Globar electric furnace which is being manufactured and sold by C. I. Hayes, Inc., Providence, R. I. Furnaces are made in two general types, one for intermittent, light-duty purposes and the other for continuous, heavy-production operation.

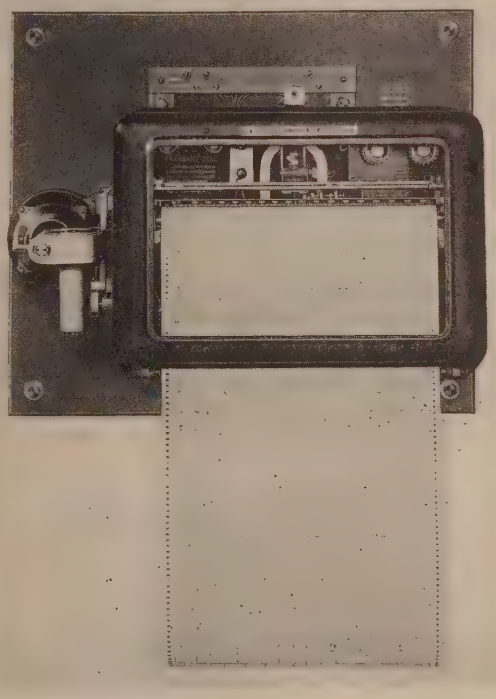
One of the most important uses of these furnaces is for heat treating high-speed steel tools. The method of controlling the temperature of the furnace's atmosphere is claimed to involve a new principle, which con-

sists of maintaining an unbroken curtain of burned gases across the furnace opening, forced through a slot in the throat of the furnace between the door and the heating chamber. The volume and mixture of the gases may be controlled to produce the ideal furnace atmosphere, which is neutral or slightly reducing. The curtain of gases, being transparent, does not interfere with the operator's judgment of color. It is maintained under sufficient pressure to prevent admission of air while the furnace is in operation. This permits the use of the furnace with the door open, if desired.

Furnace type HG 22 is of the light-duty or intermittent type with a heating chamber 3 in. high, 4 in. wide and 12 in. long and has a capacity of 12 kw. Type HG 32, also of the intermittent type, has a heating chamber 4 in. high, 6 in. wide and 12 in. long and a capacity of 16 kw. Types HG 42 to HG 72, five in number, are of the heavy - duty, production types. HG 42 has a heating chamber 4 in. high, 8 in. wide and 12 in. long and a capacity of 20 kw. These dimensions are increased in the other types until in type HG 72 the heating chamber is 12 in. high, 16 in. wide and 30 in. long and the capacity is 60 kw. All furnaces operate on 110 or 220 volts, either alternating or direct current.

Recording Pyrometer with Chart 12-In. Wide

USE of a 12-in. wide temperature record chart, automatic electric cold junction compensator, external electric motive power and three different chart speeds are features of a new potentiometer recording pyrometer which has been added to the line of the Wilson-Maeulen Co., 383 Concord Avenue, New York. The unusual chart width provides openness of scale and more exact readings; with the legible printing in ink of contrasting color it permits readings to be made at a distance from the instrument.



THE Chart Record Is Visible as Soon as Made. The pen never lifts from the paper, and, therefore, the record is continuous. Three chart speeds, ¾, 1½ and 3 in. per hr., are available to suit heating conditions. The temperature lines and figures are plain, and the record may be read at a distance from the instrument. The electric motor drive is externally located, as shown, and a group of recorders may be operated by one drive unit

In this instrument, designated as the No. 8201, when the measured voltage from the thermocouple changes as a result of temperature change at the thermocouple, the galvanometer pointer deflects in the corresponding direction. At intervals of 10 sec. a boom descends and grips the pointer firmly, while two sensing fingers, moving in a vertical plane, approach the pointer from each side, exploring for the location of the pointer. If either finger finds the pointer deflected and away from its central or null position, a roller ratchet dog is released by the finger, causing a drum to turn.

By means of a violin string, wound around the drum, passing over pulleys at each side of the chart and attached at opposite sides of a carriage, motion of the drum in either direction is transmitted to the carriage, which is arranged to travel back and forth across the entire instrument. The carriage carries the marking pen, and a contact brush that rides on the potentiometer slide wire. The selective operation of the drum's rotation, both in direction and extent, moves the contact on the slide wire to bring the galvanometer back toward its null or undeflected position; at the same time it moves the pen to record on the chart the temperature of the thermocouple.

The three chart speeds are ¾, 1½ and 3 in. per hr. On operations where temperature changes are slow and long periods of time are involved, the slow speed condenses the record and makes observation of trends and cycles easier. For rapidly fluctuating temperatures and short cycles of operation, the faster speeds allow more detailed analysis of changes.

Being integral, the recording pen and the slide wire contact cannot get out of relationship to each other. The pen has a metal tube siphon that can be cleaned and handled without breaking; the ink reservoir holds a supply sufficient for an entire record roll. The ink employed has a brilliant red color and dries before the chart emerges from the case.

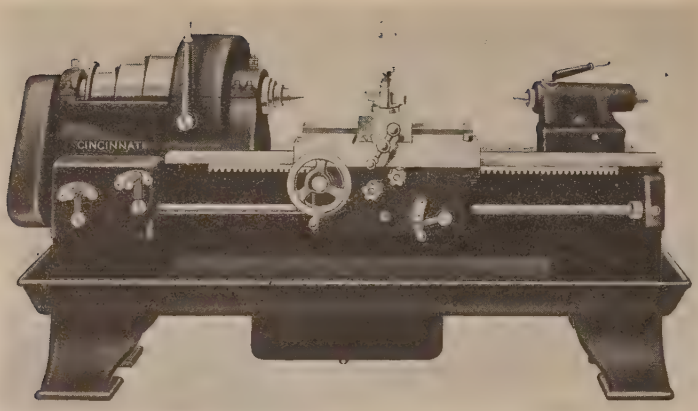
Provision for quickly adjusting the sprocket at one end of the paper roller as to distance from the sprocket at the other end of the roller permits adjustment for variation in the width of the chart paper due to atmospheric conditions.

The external drive unit, consisting of motor and double worm and gear speed reducer located outside the instrument case, is the same as that employed in connection with the company's automatic temperature controllers. It provides ample power for operating more than one instrument, and the arrangement is such that a group of recorders or a group combining this recorder and the company's automatic temperature control pyrometer, can be operated by one drive unit.

Charts are available for a wide selection of scale ranges, in both Fahrenheit and Centigrade. For low temperature operations, from 600 deg. Fahr. to 0 deg. Fahr. or lower, the recorder is supplied to operate as an electric thermometer employing resistance bulbs. The instrument case opens diagonally, making the entire mechanism easily accessible. A storage roll and holder that fits underneath the recorder is available for rolling up and holding the used portion of the chart.

American Steel Foundries reports, for the quarter ended Sept. 30, net profits of $1,053,842 after Federal taxes and depreciation, compared with $575,270 in the same period a year ago. Earnings are equivalent to 94c. a share for the 1929 period, as compared with 51c. a share in the corresponding quarter of 1928. Earnings for the nine months to Sept. 30 totaled $3,856,066, against $2,430,011 in the corresponding 1928 period.

Unfilled orders of Allis-Chalmers Mfg. Co., West Allis, Wis., on Nov. 1 were $13,900,000, against $13,446,000 on Oct. 1, an increase of $454,000. Unfilled orders Sept. 1 totaled $14,086,000. On Jan. 1, 1929, order books showed $9,639,000 of unfilled business.



New Line of High-Speed Lathes

TO permit economical use of tungsten-carbide cutting tools, the Cincinnati Lathe & Tool Co., Cincinnati, has developed a line of "Maxi-Production" lathes having speeds up to 1000 r.p.m. The machines are built in 17, 19 and 21-in. sizes, with 6-ft. and longer beds.

By operating a lever on the headstock, the spindle is started and stopped instantly through a positive friction clutch and brake, but the cone continues operating until stopped by the countershaft. The headstock is designed to assure adequate strength under severe conditions. The spindle is made from a high-carbon steel forging, has a 2⅜-in. hole for barstock, and is mounted in Timken roller bearings. The lathe can be furnished either with or without back-gears.

The tailstock construction permits a wide range of adjustments at different angles of the compound rest. Either a quick-acting or a standard screw feed tailstock can be furnished. The feed box gives a wide range, from very coarse to fine feeds; it may be replaced at any time with the company's quick-change gear unit for screw cutting. A plain rest is provided with the regular equipment, but any of the standard rests or turret attachments can be supplied.

Radial Drill Features Centralized Control

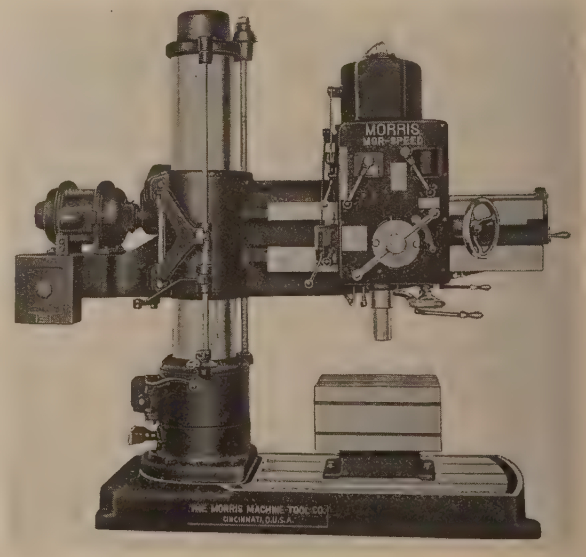
CENTRALIZED control and use of anti-friction bearings throughout are features of new 11-in. and 13-in. radial drills which have been added to the "Mor-Speed" line of the Morris Machine Tool Co., Cincinnati.

Only one constant-speed motor, mounted on the arm, is employed to drive the entire machine, including the elevating attachment. There are 27 speeds and 12 feeds. All speed and feed changes are located in the head, and changes may be made without leaving the operating position. The column clamp, elevating lever and head clamping lever are within easy reach.

All gears are hardened and have broached keyways, and shafts and spindles are heat treated and multiple splined. There are no loose keys, and clutches, tumbler gears or dive keys are not used in the making of speed and feed changes. The spindle can be started, stopped or reversed instantly at the highest speeds.

The arm is raised, lowered and clamped by means of a single lever. Both inner and outer columns are mounted on radial and thrust ball bearings to facilitate swinging and assure proper alinement. The head is clamped on both sides with one movement. An electrically actuated head-moving device and column clamp, operated from push buttons on the head, can be furnished. No part of the elevating device is in motion except when actually raising or lowering the arm. It is not necessary to stop or slow down the motor at any time, as the elevating lever is thrown to elevating or lowering position while the motor is running.

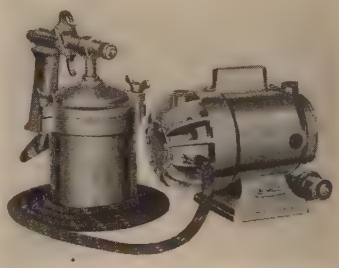
All moving parts of the machine are continuously lubricated. The entire head runs in oil, a ball-bearing pump delivering oil to the top of the head through a sight-feed oiler. Other parts are oiled from a central reservoir.



THE One Motor, on the Arm, Drives the Entire Machine, Including the Elevating Attachment. Twenty-seven speeds and twelve feeds are obtainable, all speed and feed changes being made at the head

Portable Electric Paint Spray

A NEW electric paint spray machine of the compressor type has been put on the market by the Breuer Electric Mfg. Co., 852 Blackhawk Street, Chicago. The equipment is designed for touch-up work, shading and light finishing and refinishing jobs, as well as semi-production and



maintenance industrial painting work. It has the trade name Tornado.

The sprayer, which is of the rotary compressor type, is built of aluminum castings and driven by a ⅓-hp. General Electric motor. The compressor unit weighs 7 lb. and develops a pressure of over 35 lb. to the square inch.

Two tips may be used with the spray-gun, one being slotted for a fan spray and the other a narrow spray. The area covered is from 2 to 14 in. A handy adjusting screw controls the amount of paint to be used. The spray-gun weighs 2 lb. and the container has capacity of 1 quart.

Tariff Bill May Be Killed

Opinion in Washington Is New Measure Will Never Become a Law—Coalition Group in Senate Reduces Pig Iron Duty, Restores Manganese Ore Rate

WASHINGTON, Nov. 12.—Slashing the duty on pig iron to 75c. a gross ton, restoring the duty on manganese ore to 1c. a lb. and making it apply on metallic content in excess of 10 per cent instead of 30 per cent, as in the present law, and making many other changes, the coalition of Democrats and irregular Republicans in the Senate completely dictated the draft of the metal schedule in the tariff bill. Administration forces were helpless, and offered no resistance. The metal schedule as a result has been greatly changed. The coalition at times had the support of regular Republicans. On the other hand, there were instances where Democrats stood with the Administration forces and went down to defeat with them. It was an exhibition of curious alinements, and difficult to explain, even when political expediency and sectional interest are kept in mind.

The prolonged debate on the metal schedule, begun on Thursday of last week, became heated at times, particularly during the dicussion on manganese ore. The Senate voted to place a duty of 1c. a lb. on the manganese content of 10 per cent or more, thus killing the committee amendment to place manganese ore on the free list and increasing the content range of manganese now dutiable when it grades 30 per cent or higher, a duty that was continued in the House bill. The manganese duty was voted upon an amendment by Sen-

Senate Action on Metal Schedule of Tariff Bill

Senate Bill Paragraph		Rate Adopted by Senate	Reported by Senate Finance Committee	House Bill Rate	Present Rate
301	Pig iron, ton	75c.	$1.50	$1.125	$1.125
301	Spiegeleisen, ton	75c.	$1.00	75c.	75c.

305	Tungsten iron or steel	8 per cent plus 72c. lb. contained tungsten in excess of 2/10 per cent	8 per cent plus 72c. lb. contained tungsten in excess of 2/10 per cent	8 per cent plus 72c. lb. contained tungsten in excess of 2/10 per cent	8 per cent plus 72c. lb. contained tungsten in excess of 6/10 per cent

*Earthenware Schedule (2).

(*Continued on page* 218)

ator Oddie of Nevada, who originally proposed to step up the rates to as high as 1½c. a lb. for 30 per cent manganese. The vote was 60 to 18. The only two Democrats voting to sustain the Finance Committee amendment were Senator Barkley of Kentucky and Senator Walsh of Massachusetts. Among regular Republicans who voted for the Oddie amendment was Senator Smoot of Utah, chairman of the Finance Committee.

Pig Iron Cut Carried 48 to 30

The amendment to cut the duty on pig iron to 75c. from the rate of $1.50 proposed by the committee was offered by Senator Barkley and was adopted by a vote of 48 to 30. The House bill continues the present duty of $1.125. The four Democrats who voted against the Barkley amendment were Senators Ransdell and Broussard of Louisiana; Senator Heflin of Alabama and Senator Kendrick of Wyoming. A number of regular Republicans voted for the Barkley amendment. These two record votes are typical of those made on other items. It is therefore not entirely true that the changes made in the schedule were dictated solely by the coalition, though its controlling position was manifest at all times.

One of the capricious turns taken in the course of action on the schedule was the retention of sponge iron in the earthenware schedule at the existing rate of 30 per cent ad valorem, or the specific equivalent of about $9, a rate apparently sought from no source. This product, so far made in the United States only experimentally, comes entirely from Sweden, and it was the purpose of the Senate Finance Committee to put the item in the first paragraph of the metal schedule with a rate of $2 a ton, as against the House bill rate of 0.3c. a lb. or $6.72 a ton.

Ferromanganese Duty 1⅞c. a Lb.

In voting the 1c. duty on manganese ore, the Senate found that it had automatically restored the compensatory duty of ⅞c. a lb. on ferromanganese so that the duty of 0.65c. a lb. on the alloy proposed by the Finance Committee was restored to 1⅞c. a lb. Likewise, it automatically eliminated the Finance Committee amendment reducing by 0.0087c. a lb. the duty on virtually all steel imports. The coalition left in the tariff bill the minimum of 1½c. a lb., as a base for applying steel duties. In the present tariff law the minimum is 1c. a lb., and the American Iron and Steel Institute urged the advance to the 1½c. minimum on the ground that steel, regardless of where it is made, can

Senate Bill Paragraph		Rate Adopted by Senate	Reported by Senate Finance Committee	House Bill Rate	Present Rate
305	Molybdenum steel or iron	8 per cent plus 65c. lb. contained molybdenum in excess of 2/10 per cent	8 per cent plus 65c. lb. contained molybdenum in excess of 2/10 per cent	8 per cent plus 65c. lb. contained molybdenum in excess of 2/10 per cent	8 per cent plus 65c. lb. contained molybdenum in excess of 6/10 per cent
305	Chromium steel or iron	8 per cent plus 3c. lb. contained chromium in excess of 3/10 per cent	8 per cent plus 3c. lb. contained chromium in excess of 3/10 per cent	8 per cent plus 4c. lb. contained chromium in excess of 2/10 per cent	8 per cent—no additional cumulative specific duty for chromium
312	Structural shapes, plain, lb.	1/5c.	3/10c.	1/5c.	1/5c.

338	Butts and hinges	40	50	50	40
344	Alloy steel cylindrical rolls, per cent	In excess of 1/10 per cent vanadium or in excess of 2/10 per cent tungsten, molybdenum or chromium, 40	In excess of 1/10 per cent vanadium or in excess of 2/10 per cent tungsten or molybdenum or in excess of 3/10 per cent chromium, 40	In excess of 1/10 per cent vanadium or in excess of 2/10 per cent tungsten, molybdenum or chromium, 40	25c. lb. plus 8 per cent
352	Alloy metal cutting tools, per cent	In excess of 1/10 per cent vanadium or in excess of 2/10 per cent tungsten, molybdenum or chromium, 60	In excess of 1/10 per cent vanadium or in excess of 2/10 per cent tungsten or molybdenum or in excess of 3/10 per cent chromium, 60	In excess of 1/10 per cent vanadium or in excess of 2/10 per cent tungsten, molybdenum or chromium, 60	In excess of 6/10 per cent of molybdenum, 60
353	Electrical products, per cent	30	30	40	30 to 40
369	Automobiles, motorcycles, light chassis, and body, per cent	10	10	25	25
372	Steam turbines	15	15	30	15
372	Full-fashioned knitting machines, per cent	40	40	45	40
372	Punches, shears and bar cutters per cent	30	30	40	30
372	Gear cutters and hobbers, per cent	40	40	40	30
372	Meat or food grinding or cutting machines, per cent	30 to 40	50	30 to 40	30 to 40
302	Tungsten ore	50c.			
302	Ferrotungsten	60c. and 25 per cent			
302	Cerium metal	$1	(Blank spaces indicate that no action was taken)		
302	Ferrocerium	$1 and 25 per cent			
316	Tungsten and molybdenum products, per cent	60			
372	Machine tools, per cent	30	30	30	30
398	Iron and steel not specially provided for (basket clause)	45	45	50	40

not profitably be sold at as low a price as 1c. and that therefore this base was absurdly low.

The amendment to reduce the committee duty on structural steel from 3/10c. to ⅛c. carried by a vote of 51 to 19 and it was by practically the same vote that the rate on sheet piling was reduced to ⅛c. The House and present rate on each product is ⅛c.

Alloy Steel Duties Changed

For the most part duties proposed by the Finance Committee on alloy steels were adopted and in some cases represented reductions under House rates. The Senate Committee increased from 2 per cent to 3 per cent the chromium content which was to be dutiable, thus having the effect of reducing the duties. After this change had been accepted in several cases by the Senate, Senator Walsh, Democrat, of Montana, oberved the change when it came to alloy cylindrical rolls and insisted that the 2 per cent be made applicable to chromium steel in this item as he did in the subsequent item of alloy metal-cutting tools. It was not clear whether Senator Walsh realized that he had actually voted for an increased duty, though he had been told by Senator Smoot that that would be the result. Nevertheless, the coalition accepted the Walsh amendment.

The application of the 1c. a lb. duty on 10 per cent manganese will, based on the 1928 movement, affect 15,000 additional gross tons of contained manganese which would be made dutiable over and above the 268,176 gross tons of contained manganese imported at a dutiable rate that year, and applying only to manganese grading 30 per cent or higher. The duties collected last year totaled $6,007,142. The duty on the additional 15,000 tons would be $33,600. The ad valorem equivalent of the 1c. duty on 1928 manganese imports was 88.8 per cent and it would be raised to 89.5 per cent under the amendment adopted by the Senate.

Bill May Be Killed

There is a growing belief that the bill will never emerge from conference. The prevailing opinion is that the Senate will pass the bill sometime during the forthcoming regular session. Senator Reed of Pennsylvania, in the Senate last week, reiterated the view that the bill is dead. He thinks the coalition intends to kill it. There are others who think that, since it is writing the bill, ostensibly in behalf of the agricultural interests, the coalition is anxious to have the bill enacted. The fact remains, however, that some irregular Republicans have openly expressed the hope that it will be killed. The view also prevails that the House conferees will not accept many of the changes made by the Senate and rather than yield to the latter will let it die. It is apparently clear that if the once rejected debenture bill is tied to the tariff, as proposed by the coalition, the House will not accept it, or, even if the House conferees did yield, it is assumed that the President would veto the bill. There is also a great deal of speculation as to whether the House conferees or the President will accept the flexible provision as written by the coalition. As drafted into the Senate bill the right of the President to increase or decrease rates, following investigation by the Tariff Commission, would be taken away and it would be vested in Congress. Those favoring retention of the Presidential authority claim that because of the always wide differences in Congress on tariff questions it would be impossible for it to put the flexible provision to practical use, either because of intolerable delays or complete deadlocks. One of the weak points of the flexible provision, as it now is operated, is the long time required for investigations. The House provision would eliminate this feature by permitting prices to be based upon invoices instead of calling for investigation abroad of costs.

Advantages of Mergers Discussed

Management Meeting Also Hears Talks on Bonuses Plans for Executives, Pension and Retirements Funds

MERGERS in business were discussed at the autumn meeting of the American Management Association, held Oct. 29 to Nov. 1, inclusive, at the Hotel Statler, Detroit. "Conditions That Bring About Mergers" was the subject of a talk by O. W. Visscher, editor of the *Business Bulletin* of La Salle Extension University. Mr. Visscher said that the country is going through the greatest merger development in its history, and that only two-thirds of the businesses of 1914 remain, the reduction being almost solely due to mergers. He pointed out that both political and public opposition to mergers is disappearing.

That mergers offer certain advantages to business, such as lessening competition, reducing selling overhead, more effective advertising and greater buying efficiency, was suggested by Mr. Visscher, who added that the human factor as exemplified in management is the greatest value. Often, he said, a better and more permanent management is gained through consolidations of companies.

Some disadvantages were pointed out, such as loss of incentive among valuable employees because of lesser opportunities for promotion and inefficient functioning of new associates due to lack of coordination in new surroundings.

A. D. Berning, partner in Ernst & Ernst, accountants, in a paper entitled "Factors to Consider in Working Out Mergers," said that the benefits to be derived from mergers are in the operation and not in the forming. He outlined various essential factors upon which a successful merger must be predicated.

W. E. Harris, United Fruit Co., Boston, contended that the need of American industry is not for new large combinations of productive capacity, but a more thorough search for new markets. Mr. Berning replied to this that he considered mergers to be a definite step toward the development of new markets because larger organizations are in a better position to undertake such work, which often involves expensive research and advertising.

At a session devoted to bonus systems for executives, S. R. Rectanus, American Rolling Mill Co., Middletown, Ohio, described the executive bonus methods of that company. He said that originally it was the company's belief that all salaried employees should receive bonuses in proportion to their salaries, but this idea has changed. In 1922, 900 salaried employees were compensated out of a fund set aside from the earnings. Length of service was taken into consideration, 1 per cent extra having been awarded for each ten years of service. From 1922 to 1928, 200 of the company's 1500 salaried employees received shares in a bonus fund of $200,000. The bonus plan is restricted to a fewer number now, it being believed that many of the company's employees are not interested in earnings and that those who are responsible for growth in business in profits should receive the rewards.

A. S. Rodgers, president, White Sewing Machine Co., Cleveland, explained the managerial profit sharing plan of that company, which is based on performance of duty over certain pre-determined standards.

Eastman Pension Plan

Employee pension plans were also discussed. M. B. Folsom, assistant to the chairman, Eastman Kodak Co., described the pension, retirement and benefit plan of that company. The company has created a fund of $6,500,000, two-thirds of which has been paid in. This money is administered by an insurance company, which pays a wage dividend of 10 per cent of a worker's salary after five years' service, a weekly salary of $26.50 during sickness, a year's salary in the event of death, besides life insurance and certain remuneration upon retirement. The employee pays nothing. When the full principal is paid in, which will be within the next few years, all employees of 10 years' service or more will be covered.

Disagree on Depreciation Rate

Machinery and Equipment Builders at Odds With Bureau of Internal Revenue—Proposed Schedules Held Unacceptable

WASHINGTON, Nov. 11.—Meeting here today at the Chamber of Commerce of the United States, the fourth conference of representatives of machinery and equipment associations expressed strong disapproval of depreciation rates which the Bureau of Internal Revenue Treasury Department, is reported to have set up for application in making income tax returns. The conference adopted a resolution to be forwarded to the Commissioner of Internal Revenue suggesting that basic rates should be established through cooperation between trade associations and the bureau, action which was prompted by the fact that the bureau no longer is receiving data from the trade associations.

John T. Keenan, one of the bureau's engineers, however, told the conference that material which had been received from the bureau would be used. At the same time the conference felt that there will be difficulty in convincing the bureau of the unfairness of the rates which, it is said, will be published early next year.

It was declared that the rate for one group of machinery items is listed at 5 per cent, while representatives of the industry are of the opinion that it should be at least 10 per cent. Many other rates were read to the conference by E. F. DuBrul, general manager, National Machine Tool Builders' Association, who presided as chairman.

Rates Not To Be Mandatory

Although Mr. Keenan said that the rates to be published will not be mandatory, and that the bureau had made an investigation for the purpose of helping all industries as well as the bureau in developing uniformity and establishing a guide for charging off depreciation, apprehension was expressed that the machinery and equipment interests would be unable to obtain proper allowances.

Mr. Keenan endeavored to assure the conference that the machinery and equipment manufacturers could charge whatever depreciation rates they thought were right, and that the bureau would give them fair consideration. He was told, however, that it would be more desirable to agree in advance upon basic rates, because such a policy would avoid conflicts and expense of litigation, etc., and also develop uniform accounting, a subject which has caused a great deal of difficulty to the industries.

When Mr. Keenan was told that the bureau had abandoned cooperation with the trade associations, he explained that the rates were arrived at after investigation among users of machine tools and equipment. He also pointed out that the field agents had found a broad difference of opinion among users as to the useful life of machinery.

Depreciation Charges Have Not Been Uniform

He said he realizes the position of the manufacturers of machine tools and equipment and that he is of the opinion that some makers are not charging off enough for depreciation, while in some instances he believes too much has been charged off. It is the hope of the bureau, he said, to point the way to make the proper depreciation charges. It is his opinion that no one can determine definitely the useful life of machinery and equipment, but it can be estimated.

In reply to a question by Mr. DuBrul, Mr. Keenan said that after the engineers have completed the work on fixing rates, the entire matter will be turned over to Treasury officials. Mr. DuBrul predicted that there would be a great deal of trouble encountered with field agents, an opinion voiced also by W. W. Nichols, Allis-Chalmers Mfg. Co., president of the Machinery Builders' Society. Mr. Nichols spoke of the differences of opinion among field agents regarding rates of depreciation.

Obsolescence, also, was discussed in connection with depreciation. The conference felt that the Treasury grants inadequate allowances for obsolescence.

Profits in Various Lines

Chairman DuBrul laid before the conference reports of the Bureau of Internal Revenue showing returns of machinery, equipment and other lines of metal manufactures for 1924-1927. The tabulation showed 8 per cent profit earned against the total gross income for both 1926 and 1927 for 10 lines of production.

The lowest return, 4 per cent, made in 1927, was reported for products of blast furnaces, steel mills and rolling mills. The highest, 12 per cent, made in 1927, was reported for agricultural machinery and equipment. For the 10 lines, 11,644 companies reported no net income in 1927, while 12,139 reported no net income in 1926.

Handling Motor Discounts

The varying policy in each manufacturing group with regard to handling electric motor and other discounts was discussed at some length, without any action being taken. The differing discounts allowed by motor manufacturers to machine tool and machinery equipment makers was held to be based largely on the status of the purchasers. They range from 5 to 25 per cent, depending on whether they are large or small buyers.

It was the opinion that competitive conditions in the market for machine tools and equipment play an important part in the policy of makers of these lines, as to charges made for motors bought from manufacturers. Generally, it was stated, the charge made for motors by machine tool and equipment manufacturers merely represents the list price and discounts allowed by motor manufacturers.

When buyers of equipment purchase their motors direct for installing on the equipment, it was stated, the only charge is that for installation of the motors. It was declared that motor manufacturers do not ordinarily offer machine tool and equipment makers sufficient discount to provide the latter with a profit in stocking the motors, involving handling and other charges.

Oppose Trade Mark Proposal

Individuals in the conference expressed opposition to the trade mark and patent notice features added to the tariff bill by the Senate Committee on Finance, which would unconditionally prohibit American trade-marked imports, and supported the position of the Merchants' Association of New York, seeking repeal of the amendment. Restoration of the present provision in the existing tariff act and continued in the House bill was urged by the Merchants' Association.

The Conference voted to hold its next meeting in Washington, on Feb. 3, 1930.

Those attending the present conference were:

Association of Manufacturers of Woodworking Machinery, Fred A. Collinge manager, Chicago; L. P. Monks, president Hermance Machine Co., Williamsport, Pa.; Bakery Equipment Manufacturers Association, Miss Olga Christianson; Compressed Air Society, C. H. Rohrbach, secretary, New York; Concrete Mixer Manufacturers Bureau, Clifford F. Messinger, Chain Belt Co., Milwaukee; Dairy and Ice Cream Machine and Supplies Association, C. E. Breece, assistant secretary, New York; Forging Manufacturers Association, G. H. Weiler, secretary-manager, New York; Foundry Equipment Manufacturers Association, Verne E. Minich, American Foundry Equipment Co., New York; Machinery Builders' Society, W. W. Nichols, president, Allis-Chalmers Mfg. Co., New York; Associated General Contractors, C. S. Embrey, secretary, Mixer Manufacturers Bureau, Washington; National Machine Tool Builders' Association, C. A. Johnson, president, Gisholt Machine Co., Madison, Wis.; Ernest F. DuBrul, general manager, Cincinnati; Pressed Metal Institute, Malcolm Baird, secretary-treasurer, Buffalo; Refrigerating Machinery Association, D. N. Benedict; also Hugh P. Baker, manager and Philip P. Gott, assistant manager, Trade Association Department, Chamber of Commerce of the United States, Washington; E. W. McCullough, manager, Department of Manufacture, Chamber of Commerce of the United States, Washington; W. H. Rastall, chief, Industrial Machinery Division, Department of Commerce, Washington; M. Bacher, manager, Foreign Commerce Department, Chamber of Commerce of the United States, Washington.

Rejuvenation of Gray Iron Planned

Gray Iron Institute to Undertake Campaign to Enhance Prestige of Castings

BY L. W. SPRING*

STEEL has been made in many varieties since its production in commercial quantities as a result of Bessemer's invention of 1856 —some soft and ductile as in fence wire, some hard and brittle as in needles and sharp edged tools. Cast iron has none of such properties, but it has others which make it well adapted for certain purposes for which steel will not answer.

In brief, these properties are high fluidity, which enables molten cast iron at comparatively low temperatures to fill intricate molds; low shrinkage while the metal is solidifying in the mold; easy machining, because of the natural cleavage or breaking up of the grain of cast iron by the soft graphite flakes and the natural lubrication of the tool which these flakes afford, and considerably greater resistance to rusting and ordinary corrosive influences than steel.

The natural objections to ordinary cast iron are its lower strength of 20,000 lb. against the 60,000 to 80,000 lb. per sq. in. which steel has and its great brittleness or likelihood of breaking under shock which introduces grave danger of complete collapse under overload. Steel, because of its ductility, simply distorts and gives warning before any great danger to life comes about.

It now appears that this lowliest of the ferrous alloys is undergoing rejuvenation. Although it has been overlooked for many years and by some given up for lost, certain metallurgists have insisted that a material of so many excellent qualities perhaps could be converted into a more adaptable product if a fraction of the brains and money could be put into it that had been put into the development of steel and the steel industry. The results of two or three experiments have been so encouraging that a considerable change in the attitude toward cast iron is coming about.

Perhaps the most interesting point just now is the formation of the Gray Iron Institute, Inc., which will follow the system used by the steel manufacturers, by the American Malleable Iron Castings Association (now the Malleable Iron Research Institute, Inc.) and by others, the foundry owners supporting jointly a campaign of development which it is hoped will improve the inferior properties of cast iron and standardize the better product produced, following which advertising and sales campaigns will endeavor to bring this material into the position that it deserves.

*From a paper read before the Chicago Section of the American Chemical Society. Mr. Spring is chief chemist and metallurgist of the Crane Co., Chicago.

Types of Cast Iron

To many people, cast iron is cast iron, and it will be of interest to those who have paid slight attention to this valuable alloy to know that there are several varieties of this material each of which has certain particular advantages for certain service.

Soft or Gray Cast Iron.—Soft cast iron with about 20,000 to 25,000 lb. per sq. in. tensile strength owes the greater part of its character to the 3 to 3.5 per cent of carbon which it contains. The amount of free graphite which we may call the dominating influence in cast iron is controlled by the manufacturer mainly through the amount of silicon that he puts into the cast iron, and, secondarily, by his rate of cooling the iron from the molten into and through the solid state. The higher the silicon, therefore, the softer the cast iron because of the greater advantage of graphitization induced; also, the slower the cooling after the iron enters the mold, the softer the iron will be. Ordinarily, gray iron such as is found in stove parts, engine beds, water mains and soil pipes, is of this type.

Semisteel or High Test Cast Iron.—For some purposes, a considerably stronger cast iron is desired. By reducing the silicon content used in the cupola from the usual 2.50 per cent for soft cast iron to such lower amount as, say 1.80 per cent, less graphite is precipitated. The iron is a little harder, slightly less machineable, but with tensile strength of something like 35,000 lb. per sq. in. instead of the 20,000 lb. which soft cast iron shows. This type of cast iron is known generally as semisteel, though certain foundries and scientific societies are endeavoring to banish the name, giving it the more significant name, high test cast iron, which, of course, it is, because of its 50 per cent greater tensile strength.

Chilling Irons.—The farmer for several decades has known the Oliver chilled plow and the railroads have used chilled car wheels, though now steel wheels are available. Such products, along with brake shoes, chilled iron rolls for rolling mill work, gears and other parts which must stand hard wear have been cast from iron containing much less silicon even than semisteel. These "chilling" irons contain from 1.50 to 0.09 per cent silicon or thereabouts, the amount depending on the depth of chill desired. When cast against a "chill" (cold piece of iron which is inserted to form part of the mold), the entering molten iron is made to freeze almost instantly into a white, extremely hard layer so hard as to resist wear and abrasion very definitely. The iron is white because the quick cooling allows the graphite flakes little or no time to crystallize out. Usually the chill is so arranged that the white or chilled layer will be backed by a heavier layer of iron, which is kept gray by slower cooling. This gray layer, while much softer, has much less brittleness and thus contributes to the strength of the casting.

Malleable Cast Iron.—We are all acquainted with malleable cast iron, the somewhat ductile metal of which the cast parts for agricultural machinery, railroad car bumpers and brake beams, pipe fittings, and even cheap hammers, tin snips, and some other tools are made. The composition of such iron, its pouring temperature and handling have to be regulated with extreme nicety. It is a highly chilling iron with from 0.75 to 1 per cent of silicon, which chills so readily that every part of every casting must come white in fracture after cooling in the mold. This is necessary because such brittle iron can be made malleable only after 40 hr. or more of continuous annealing at a temperature ranging between 1400 deg. and 1800 deg. Fahr. in closed pots, followed by very slow cooling of not more than 10 deg. Fahr. an hour, through the "critical" range (from 1400 deg. to 1200 deg. Fahr.). When taken from the mold, a slight blow from a machinist's hammer will shatter a small casting into many pieces, all with white fracture, but after this annealing process of approximately a week, the casting is soft and malleable and can be broken only with difficulty. While this material after annealing has a total carbon content of from 2 to 3 per cent, the metal remains malleable because by the annealing process the carbon separates not in flake form, as in gray iron, but rather in granular form in which it is seen under the microscope as little balls of "coke" lying among the grains of iron. There are no cleavage planes in annealed malleable iron and the continuity and adjacency of the iron

grains obviates the brittleness and makes for ductility.

Pearlitic Irons.—Besides these four very common varieties of cast iron, which of course are varied in composition somewhat for different purposes so that one class sometimes merges into the other, we now have a newcomer—a more aristocratic cast iron known as pearlitic cast iron. As explained already, cast iron has been noted for and used because of its good qualities—fluidity, easy machineability, high compressive strength, and comparative cheapness—but always it has been heavily penalized because of its brittleness or low shock strength and for its lack of sufficient tensile strength.

By the metallurgist, cast iron, theoretically, is considered as being steel into which an added constituent, flake graphite, has been introduced and distributed. It occurred to the metallurgist that during the casting process it might be possible to diffuse this graphite in a way somewhat analogous to the manner of its form and distribution in malleable iron—that is, better distributed and without the long, curly, fragile flakes which produce cleavage planes in cast iron. The result is pearlitic cast iron, which, under the microscope, is seen to have a somewhat greater amount of pearlite (the strength-giving constituent of steel) with almost a total absence of long flakes of graphite, these being replaced by graphite in very small rosettes or better in little stubs. On viewing the structure through the microscope, probably even the least experienced would decide that there would be less fragility in the alloy, and this is the case.

This very desirable strong and tougher pearlitic cast iron can be made by three main processes which are coming gradually into use. By the first of these, a low silicon or chilling iron, which would give white fracture castings if poured as usual, is poured instead into heated molds, the higher temperature being sufficient to overcome any tendency of the iron to chill, and the lack of silicon preventing separation of graphite.

A second process produces castings with this desirable pearlitic structure through careful proportioning of the charge, carefully regulated composition, and the use of comparatively high-pressure blast in the cupola.

The third process brings about the same result by superheating the molten metal to a high enough temperature so that, on pouring, the molds themselves in effect are automatically heated by the metal, and the still molten iron is allowed to cool in them. While the first two processes mentioned are cupola methods, the third uses the electric furnace, by means of which the iron can be highly superheated, sometimes to 3000 deg. Fahr. or more.

Warehousing Rustless Iron Sheets

Polished Surfaces Are Handled With Gloves and Protected By Paper When Sheared Or Corrugated On Order

DISTRIBUTION of rustless iron from stock has added a product to the warehouse that must be handled with more than the usual care given to a high grade steel. In its Jersey City, N. J., warehouse, Joseph T. Ryerson & Son, Inc., maintains a stock of 60 to 70 tons and more of Nos. 11 and 12 to 24-gage sheets of Alleghany metal and Ascoloy. While the Ascoloy can be handled easily, as it is not highly polished, distribution of Alleghany metal sheets necessitates special care.

As a rule, the warehouse ships orders every second day. The sheets, which are received from the mill wrapped in a heavy tissue and crated, are taken from the crates to the shears by workmen wearing gloves to prevent finger marks appearing on the polished surface. In the shear, heavy tissue is placed on the sheet under the clamps to prevent scratching the surface, and before the shear can be used all grease and oil is removed from exposed parts to prevent soiling the sheet. After cutting, the sheets are returned to the rustless iron stock-room, and are wrapped in a heavy crimped paper with a tarred center and placed in a new crate for delivery to the consumer.

Shearing to the required size leaves a quantity of small strips, which with ordinary sheets would unquestionably go to the scrap pile. With rustless iron, however, only the smallest scraps of metal are discarded, strips, sometimes of only a few inches in width being carefully wrapped in paper and returned to stock as possibly salable at a slight reduction in price to some other customer. The salesmen, knowing of an accumulation of such material in a certain size, are often able to dispose of it to a manufacturer who has not been using rustless iron.

Recently a number of long narrow strips had accumulated in stock from an order placed by a large user, and a manufacturer of show cases, who had been using other metals, became interested and purchased the strips at a reduction from the full market price.

When a piece of rustless iron is so small that it reaches the scrap pile it has decreased in value far more than ordinary steel scrap and seldom brings much more than 1c. per lb., although the original selling price of the new material ranged from 45c. to 66c. per lb. out of stock. Consequently, the scrap pile is kept at a minimum to prevent unnecessary loss.

The care with which such sheets are handled is exemplified in a small order recently executed by this warehouse for sheets used in decorating a modernistic room in the Metropolitan Museum of Art in New York. The ceiling of the room was sheathed with corrugated, rustless iron sheets and, in corrugating them, each sheet was covered with paper before passing it through the corrugating machine, to prevent damage to the surface.

Program of Annual Meeting of Taylor Society

The annual meeting of the Taylor Society will be held at Hotel Pennsylvania, New York, Dec. 4 to 6. The program follows:

Wednesday afternoon, Dec. 4, Edward Eyre Hunt, presiding:

Analysis of "Recent Economic Changes", with emphasis on subjects of practical interest to management, by R. W. Burgess, chief statistician, Western Electric Co., New York.

Wednesday evening, Dec. 4, Henry Bruere, presiding:

"Are There Practical Steps Toward an Industrial Equilibrium?" by Wesley C. Mitchell, National Bureau of Economic Research and Columbia University, New York.

"What Bearing Has Industrial Equilibrium on Regularity of Operations and of Employment?" by Leo Wollman, New School of Social Research, and director of research, Amalgamated Clothing Workers of America, New York.

Thursday morning, Dec. 5, Morris L. Cooke, presiding:

"What Are the Controllable and the Uncontrollable Factors in Management?" by Howard Coonley, president, Walworth Co., Boston.

"Is There an Optimum Size of Organization (Centralization vs. Decentralization)," by John H. Williams, consulting engineer, New York.

Thursday afternoon, Dec. 5: Roundtable discussions on industrial standardization, accounting for distribution costs, and marketing with special reference to planning, organization and supervision.

Thursday evening, Dec. 5: Annual dinner, with reports on management in Western Europe, Russia and Japan from returned travelers.

Friday morning, Dec. 6, Percy S. Straus, presiding:

"Is it Good Management Policy to Assume That Consumer Wants for Particular Goods Are Insatiable?" by Paul H. Nystrom, business and marketing consultant, Columbia University, New York.

"Is it Sound Assumption That Consolidation Results in Reduction of Distribution Expense?" by J. E. Judson, Ford, Bacon & Davis, New York.

Friday afternoon, Dec. 6, R. H. Lansburgh, presiding:

"The Technique of Methods of Study," by H. K. Hathaway, consulting engineer, New York.

Friday evening, Dec. 6, Henry P. Kendall, presiding:

"How Shall Large Groups Be Organized and Managed to Secure the Ability, Capacity and Energetic Effort of Each Individual as Though He Were in a Business of His Own? by Malcolm C. Rorty, president, International Telephone Securities Corporation, and vice-president, International Telephone & Telegraph Co., New York.

This Issue in Brief

Good dividends in production are paid by apprenticeship course in machine tool plant. No shop training room is used. Apprentices are assigned directly to production departments, and work on a production basis, under joint supervision of foreman and shop instructor. Fifty per cent of the graduates since 1915 are still with the company, and nearly all hold responsible positions.—Page 1293.

* * *

"Anti-aging" steel is not an alloy, but a carefully made open-hearth steel. The German product, Izett, adapted especially for boiler fabrication, as it resists embrittling influence of alkaline feed water, is thoroughly "washed" with manganese during the melting process, and then killed with aluminum. — Page 1302.

* * *

True elastic limit of structural steel columns proves to be much lower than minimum yield point. Carbon steel columns failed at about 84 per cent of calculated yield point, silicon steel at 96 per cent and manganese steel at 99 per cent or better.—Page 1302.

* * *

Heat treating costs reduced by preheating air for oil combustion. Air for combustion is forced through a coil in a recuperator, where it is heated to about 600 deg. Fahr. and then delivered to oil burners.—Page 1304.

* * *

Reduction in oil consumption in steel casting plant is obtained by installing an oil indicator showing number of gallons burned each hour. As results are visible to operators, competition for low oil consumption is promoted.—Page 1308.

* * *

Poor quality steel results from use of scrap over and over again. "Inbreeding" process is undesirable. A prominent metallurgist declares that all heats of steel should be made with at least 70 per cent virgin metal.—Page 1310.

Overstressing increases the endurance limit of steel, metallurgists believe. Tests reveal that the yield ranges on overstressed specimens are always greater than corresponding results for steel in its primitive state.—Page 1306.

* * *

Better steel at lower cost results from providing proper amount of air for the fuel burned. Automatic open-hearth furnace control eliminates guesswork. Less excess air reduces fuel consumption, and, with less excess air, there is much less waste gas and longer furnace life.—Page 1308.

* * *

Rustless iron sheets are handled with gloves, to protect polished surfaces. Sheets are protected by paper when sheared or corrugated. As scrap value is low, only the smallest scraps are discarded. Small pieces are sold at slightly reduced price to manufacturers producing small parts. —Page 1322.

* * *

This slat conveyor turns corners. Inner corners of slats are cut away to allow clearance in making turns. Openings between slats do not interfere with handling tote pans, boxes and other packages with flat surfaces. —Page 1312.

* * *

Merger movement greatest in history of country, says economist. Only two-thirds of the businesses of 1914 remain, largely due to mergers. There is no economy merely in merging, but in cost reductions worked out after the merger.—Page 1319.

* * *

Cast iron is undergoing rejuvenation, says metallurgist. The lowliest of ferrous alloys is on the threshold of a new day, which would have dawned long before this if cast iron had received a fraction of the brains and money that have been put into the development of steel.—Page 1321.

Annealing costs cut and quality of product improved by controlling cooling as well as heating cycles. To reduce heat capacity of the furnace structure, the chamber is lined with light weight semi-refractory brick, which allows the walls to heat or cool in nearly half the time consumed by ordinary refractories. Cooling coils and auxiliary ventilating system permit the cooling cycle to be varied.—Page 1311.

* * *

Lubricating parts subjected to hot water or steam presents a difficult problem. Straight mineral lubricants will not withstand the washing action of hot water, so the lubricant is compounded with substances giving it adhesive properties. Bath lubrication is favored where conditions permit use of oil tight gear cases.—Page 1299.

* * *

Load-carrying strength of silicon structural steel and manganese structual steel box-section columns is much greater than that of carbon steel columns. Tests to destruction reveal that manganese steels will withstand almost twice the stress at which the carbon steel columns fail.—Page 1300.

* * *

Heat-treating labor cost cut by use of interconnected furnaces. Normalizing, hardening and drawing furnaces are in line, connected by automatic mechanical-handling system. The unit is flexible as to range of heat treatment and size of work.—Page 1304.

* * *

Increases open-hearth furnace output 10 per cent by installing special combustion control equipment to mix blast furnace and coke oven gas so as to give a constant value of about 500 B.t.u. to the cubic foot. Cost of equipping one furnace is about $10,000.—Page 1308.

ESTABLISHED 1855

Some Things That Will Help

IT is too early to foresee the full effects of the securities crash on business. That a shock to industry and trade is unescapable is well understood, but it is also appreciated that the shock will be much more severe if narrow, selfish motives are permitted to dominate business policy.

The force of circumstances is strong and the integrity of one's own business is perforce a prime consideration; but there is evidence that immediate private advantage is being subordinated to the general good to a greater extent than in other Wall Street crises. Business leaders have not forgotten the old alternations of feast and famine and in recent years have learned the benefits of stability. They realize that they are trustees of prosperity.

When the October hysteria in Wall Street was at its worst, the Rockefellers and others announced that the declines had gone too far and backed up that conviction by buying securities. Later, extra dividends were declared by the United States Steel Corporation, the American Can Co. and other companies.

What has been done to restore public confidence will be matched, it is hoped, by constructive measures to prevent trade reaction. A sharp increase in unemployment at this time would be a much more serious threat to business than Wall Street losses. While these losses will undoubtedly have an adverse effect on consumer buying, the importance of this factor may easily be overestimated. Granted that the speculative mania extended to virtually all classes of the population in New York and other large centers, there are many millions in the smaller towns and on the farms whom it did not reach. The total number of securities owners in this country is estimated at 4,000,000 by M. H. Hutchinson, secretary of the Conference of Statisticians in Industry. A large proportion of these own their shares outright or are paying for them out of their pay envelopes. Over 1,000,000 industrial employees hold stocks in the companies in which they work. Stockholders of this type are in the same position that they were before the stock market collapse except for the depressing knowledge that their holdings have declined in value. Even among those who speculated it is safe to say that paper losses outnumbered monetary losses.

But there is no blinking the fact that the disposition to buy consumer goods has been adversely affected, doubtless to a greater extent than purchasing power. This psychology should not lead business into short-sighted or hasty action. Happily the consequences of ill-considered moves that would seriously affect employment are now better understood than ever in our history. Even in the automobile industry, in which readjustment was under way before the securities debacle, part-time working schedules have been put into effect by certain companies in an effort to keep all employees on the payroll.

No longer are employees hired and fired with every fluctuation in business volume. Mass production depends on mass demand and the sources of mass demand must be protected. This fact not only tempers the attitude of business in times of stress like the present, but is becoming a fixture in the policy of a growing number of industrial companies. For example, a large manufacturer of heating equipment, whose business is highly seasonal, is now working under schedules which call for operations at an even rate throughout the year, to insure regular employment for its workers.

It is more and more appreciated that an executive's responsibility does not end with his stockholders; that his trusteeship extends to his employees and to the army of ultimate customers, the general public. Whatever we may think of some things that bear the New Era label, this more enlightened thinking of the heads of industry, in contrast with the old devil-take-the-hindmost policy, is one of the most favorable factors in the present situation.

Still a Great Year in Steel

BESSEMER and open-hearth steel ingot statistics for October have some interesting points. In daily rate of production there was almost as much decrease from September to October as there had been in the whole period May to September, which confirms what our market comments have brought out—that steel production was in an important decline before the crash in the stock market had time to become an influence. Beginning only on the afternoon of Oct. 23, the stock market disaster could not have affected the month's production materially. The September to October decrease in daily rate was 7.4 per cent, while the May to September decrease, in four months, was only 7.6 per cent. As to the recent movement being contrary to the usual seasonal swing, it is to be noted that in the last five years there has been an average increase in daily rate, September to October, of 3.9 per cent.

The monthly reports refer only to Bessemer and open-hearth ingots, electric and crucible ingot statistics being gathered only once a year. Last year electric and crucible ingots amounted to nine-tenths of one per cent of the Bessemer and open-hearth, while for this year an allowance of one per cent may be made. Total Bessemer and open-hearth for ten months

CARNEGIE LIBRARY OF ATLANTA

is given at 47,758,054 tons. Adding one per cent would make 48,233,000 tons for the full total.

We may now appraise the probable error of forecasts of the year's total steel ingot production. To bring out a total of 55,000,000 tons for the year there would be required a producing rate in the 51 working days of November and December of only 67 per cent, against 85 per cent reported for October, while to make a total of 56,000,000 tons a 77 per cent rate would be required for these two months. The probability is that the fact will lie between these limits. A total of 55,500,000 tons would represent 10.3 per cent increase over 1928, which stood at 50,325,393 tons. From 1923 to 1928 there was a total increase of 16 per cent, averaging 3.2 per cent a year. From 1926 to 1928, two record years with an off year between, the increase was 7 per cent. In future years 1929 will stand out as one of large gain, while the facts of its exceptional first three quarters and its relatively lame ending may be forgotten.

Lotteries and Plant Morale

LOTTERIES which have sprung up in recent years, aiming to reach people of small means, have taken on proportions at many manufacturing plants that demand serious managerial attention. For one thing, management complains, employees spend altogether too much of their earnings in the effort to secure one of the large prizes. For another thing, when some employee wins a few hundred dollars, or, in case of a capital prize, a thousand dollars or more, the fever spreads like wildfire, men and women buying ticket after ticket without thought of the needs of their families.

One of the worst features of the evil is that the lottery operates continuously and every work day some thousands of dollars are distributed to the holders of winning tickets. The usual price of a ticket is 50 cents, which for the habitues, who constitute at least a large minority, means $3 a week. Where the gambling germ has taken a real hold one daily ticket is not enough. The result is that case after case is brought to the attention of the office through the action of creditors, since too little money is left in the pay envelope for current expenses. Naturally under such conditions the worker's mind is not on his work, morale is lowered and with it production.

Of course the lotteries are illegal. State and Federal statutes prohibit them. But the promoters know the laws and the ways of outwitting them, in which they are abetted by a certain code among their customers, so that betrayals are rare. The promoters avoid the mails. A lottery operating in one State is conducted from an office in another State. The tickets tell no tales. There is no drawing. The winners are determined from published facts or figures, which all may read, such as baseball scores and financial record figures, a favorite being the daily clearing house totals. The owner reads for himself whether or not he has won. He believes the game a square one. But the lotteries always profit hugely.

To the average plant manager the question is not one of ethics or law-breaking, but of the effect of this persistent gambling on his employees. Officials may overlook the milder forms of gambling, such as a baseball or football pool within a department, where none may profit but the winner, and none may stake more than some trivial sum. The professional lottery is another matter, conducted day after day throughout the year, now dwindling in interest, now, because of a winning, breaking out into a flood of ticket-buying. The evil may be cut off at its root for the time being, where it is discovered that some employee is the ticket-selling agent. But usually the solution is not so simple. Not a few managers are still studying the proper approach. They realize that too drastic action may result only in inducing a more crafty, underground system of continuing the business. How to bring to bear persuasion and an appreciation of the folly of the practice is a baffling problem.

Foresees Better Building Situation

"BEFORE many months a sufficient supply of mortgage money should become available to afford the building industry with a marked stimulant," says the Alexander Hamilton Institute in its *Business Conditions Weekly*. "A second favorable factor is the reduction in the supply of vacant buildings which is resulting from the current curtailment of construction. The downward trend of rents which characterized the situation from the middle of 1924 to the end of 1928 has not been in evidence this year. The rent index (1924=100), after declining from 184 in August, 1924, to 159 at the beginning of 1929, is still at the latter figure."

It is admitted, however, that curtailed purchasing power and the caution of buyers may hinder a recovery of building, and it is also pointed out that high wages may prove a retarding factor. The wage index (1913=100) is now 238 as against 233 a year ago and 179 in March, 1922, when the advance started. The advance in wages, according to the institute, has more than offset the decline in building material prices, the index for the two factors combined now being 195 as against 191 a year ago.

Our Economic Ignorance

STOCK market ups and downs during the last two or three years give economists, professional and amateur, much upon which to reflect. When stocks were rising to an unprecedented average and many persons were realizing profits, while a great many more viewed with satisfaction the rise in the quotational value of their possessions, it was easy for economists themselves to become the victims of illusion in respect to increase in the national wealth, the national income, the national surplus, etc. Promoters made use of such data in their essays for the temptation of customers. There were few philosophers who tried to point out how such calculations would look if things turned the other way around. Since things have so turned we might as well be honest and admit that no one knows enough about our national economy to give him a standing as a prophet.

A national economy is essentially the same as that of an individual person, but it is multiplied by something like 50 millions in the instance of the United States and is immensely more complicated than are

the affairs of the average person among 50 million. However, the basic element is the same, i.e., wealth, and by that term we mean the summary of the physical things that we possess rather than quotational valuations, although we are bound to adopt estimates of value in order to make an addition. The careful individual does this in an annual inventory.

The next thing that he has to know is the amount of his income, which he may subdivide into earned income and profit realized from appreciation in value of property, as indeed he is obliged to subdivide in making his income tax return. He may then figure his saving—his surplus of income over his expenses—and that will be an addition to his wealth, providing he has not had losses by fire, flood and tempest, by property becoming obsolescent, or otherwise, thus losing its value.

The intelligent individual will also examine his expense account and consider what wastes are included in it that may be curtailed. He furthermore will budget the estimates for new facilities that will be required in the future. With such methods he will be able to do some reasonable forecasting. The economists who essay to forecast our national future have scarcely any data of this nature. How then can they do anything but conjecture?

Other data that are necessary in an examination of our national affairs are: Population; number of workers; percentage of employment; occupational statistics (determination of the personnel attached to the several industries); consumption of commodities; percentage of manufacturing capacity in use; index of general price level; aggregate of taxation (national, State, county and town). This recital of needs is by no means comprehensive; rather is it merely suggestive.

Many of the subjects above mentioned, as well as others of major importance, are already under investigation by economic and statistical organizations, and by departments of the Federal Government. Unfortunately there is an absence of uniformity in their methods and theories, and consequently they offer only fragmentary data that cannot well be pieced together. There is a great need for a council that would collect and summarize what the many individual bodies are doing, would undertake to coordinate their work, would arrange cooperation among them, would establish principles, and in short would assume the functions of a statistical clearing house. With such a directing head, which ought to be of recognized authority (but no part of the Federal Government), there would be developed in the course of time a mass of practical information that would enable us to manage ourselves better than we do now; also it would build some firm ground for prophecy, which there is not now.

Old and New Strategy of Industrial Progress

BY DR. WILLIAM E. WICKENDEN*

SOME men are so significant that they mark an epoch; an era of history closes when they pass to their reward. Will we see another Edison? Probably not. To get perspective on his life and times we must go back to times before the idea of progress was invented. Medieval Europe, living on ideas borrowed from the ancients, fell into static ways. Men cared more for preserving than for improving traditional ways. The free labor of the guilds was more fertile than the slave labor of the ancients. In it a revolutionary idea germinated, that tools and processes could be made better by deliberate effort without waiting for slow evolution.

Early Pioneer Inventors Were Workingmen

The century beginning with Watt's engine in 1767 was the most amazing in all industrial history. Its pioneers were nearly all workingmen, trained by apprenticeship and self-taught in rudimentary science. Their work was so brilliant that men came to have almost boundless confidence in trial and error process of experiment and invention. This tradition was Edison's inheritance and he its most brilliant exemplar.

In a few months we are to celebrate the semi-centennial of the incandescent lamp. Edison did not invent the lamp; the basic ideas were old; but he reduced them to commercial practicality with prodigious experimental labor and resourcefulness. As Edison himself described his method:

> Through all those years of experimenting and research I never once made a discovery. All my work was deductive, and the results I achieved were those of invention pure and simple. I would construct a theory and work on it until I found it untenable, then it would be discarded at once and another theory evolved. This was the only possible way for me to work out the problem.

The New Strategy of Progress

In the old order of events the technical arts grew out of discovery and science followed after—usually long after—with her higher refinements. Two great modern industries have grown by reversing this order, the chemical and the electrical. The new plan has been found immensely fertile and time-saving. Thirty years after Faraday worked out the principle of electromagnetic induction, Paccinoti had his dynamo running, while less than ten years separated J. J. Thompson's work on the electrical conduction of gases and Fleming's vacuum tube valve. Three years later De Forest added the third element on which the radio art has been built.

Contrast this record with the 150 years which elapsed between Newcomer's engine and the study of the essential conditions of its efficiency by Carnot and Rankine and you have the case in a nutshell.

The new strategy of progress is the substitution of the orderly attack of the research laboratory for our old dependence on sporadic invention. As one modern philosopher says:

> The greatest invention of the nineteenth century was the invention of the method of invention. . . . That is the real novelty which has broken up the foundations of the old civilization.

*Abstract of an address, "An Epoch in the Making," at the annual banquet of the American Society for Steel Treating at Cleveland, Sept. 12. Dr. Wickenden is the new president of Case School of Applied Science, Cleveland.

National Founders to Meet Nov. 20 and 21

The National Founders Association announces that the program for its thirty-third annual meeting, to be held at the Hotel Astor, New York, Nov. 20 and 21 has been completed and will include the following addresses: "Business Policies and Business Information," by Roland P. Faulkner, chief statistician, National Industrial Conference Board; "Seven Years' Foundry Development," by D. R. Wilson, president, Wilson Foundry & Machine Co., Pontiac, Mich.; "Finance," by Frank F. Winans, Baker, Winans & Harden, New York; "The Legislative Situation," by Walter Gordon Merritt, League for Industrial Rights; "Third International Foundrymen's Congress," by S. Wells Utley, Detroit Steel Casting Co., Detroit; "Changing Ideas of Control," by Elton Mayo, professor of industrial research, Harvard University, Graduate School of Business Administration; "The Business of Selling," by R. C. Borden and Alvin C. Busse, professors of public speaking, New York University.

At the convention dinner Wednesday evening, Nov. 20, Thomas S. Hammond of the Whiting Co., Harvey, Ill., president of the association, will be toastmaster. E. H. Sothern, noted actor, will be the principal speaker, his subject to be, "Reminiscences of the Stage."

Recommends Study of Steel Construction

Charles N. Fitts of the New England Structural Co., in his presidential address to the American Institute of Steel Construction, meeting in convention at Biloxi, Miss., Nov. 13, attributed the satisfactory structural steel sales to the fact that the public is beginning to realize the economies, as well as the safety and security, of steel construction. Mr. Fitts recommended:

1. That preparations be made for a semi-centennial celebration in 1934 of the invention of the skyscraper.

2. That the Federal Government be petitioned to create in the Bureau of Standards a division to diagnose demolished buildings.

3. That an expert investigation be made of the effect of the tall building on taxation, health and society.

4. That the Bureau of the Census be requested to enlarge its current statistics so that trading areas be measured and established for basic commodities, such as structural steel.

Tidewater Rolling Mills is the name of a new company which has taken over the rerolling mill of the Walash & McGee Steel Co. at 646 Doremus Street, Newark, N. J. A New York office has been opened at 75 West Street. The company will make angles, bands, bars, metal lath and special shapes.

The Week in Business

Drift of Current Financial and Economic Opinion

BUSINESS statistics are commanding less interest than usual, for it is realized that the forecast value of past performance in industry and trade has been materially reduced by the stock market collapse. The outlook is further clouded by the fact that a moderate business reaction was already under way, making it difficult to distinguish between normal trade retrenchment and the consequences of Wall Street losses.

Huge "Paper" Losses Will Affect Real Values

"It is all very well to talk of the fundamental soundness of business," says the *Commercial and Financial Chronicle*, "but the disappearance in a month of 25 to 40 billions of *paper values* in the leading industries of the country cannot fail to affect the *real values* thereof. Of course the wheels will continue to turn, production of some volume will go on, but the buying power of the people must be less."

A similar view is held by Benjamin Baker of the *Annalist*, who writes: "The effects of the crash will have an abnormally large influence in slowing business, and will not impossibly make full recovery slower and more difficult than would be the emergence from a depression not aggravated by the existing financial 'hangover.'"

More conservative is the opinion of Alexander D. Noyes, New York *Times*, who says: "Only the course of time will show whether trade has actually been affected, and how greatly." In 1907 and in 1920, he recalls, industrial reaction was cause rather than consequence of events on the Stock Exchange. But an accurate analysis of the present position of business cannot be made until it is ascertained "how far, in some great industries, the rash use of credit from which producers carefully abstained was practised by consumers."

The very attitude of self-examination and caution that business has now assumed will, of course, tend to slow up trade temporarily, but no one doubts the economic soundness and growth of the United States. As Theodore H. Price, *Commerce and Finance*, sums it up: "Even those plants which grow most vigorously do not always grow constantly, and the greatest prosperity has its vicissitudes."

Likens America to England After Napoleonic Wars

Enthusiasm over our prosperity, which was suddenly chilled by the securities collapse, is still held by Lord Hindlip, a British observer, writing in the *Bache Review*. "I think that the low levels reached by the good securities is an incident," he declares, "just as the high levels reached at the peak were an incident. I think they are both stupid, and neither have anything to do with values, and I have not the slightest doubt that in the course of time, maybe six months, maybe one year, or two, the prices reached at the peak will look cheap.

"I think it is quite impossible to be anything but optimistic about America. Shortly, the situation seems to be, on an infinitely greater scale, the same as obtained in England after she recovered from the Napoleonic Wars, when she had some 80 years of great prosperity. . . . We had cheap coal, steam; manufactured for the world in iron, steel cotton, wool; we had the money; we had the shipping trade. Now apart from the shipping trade—and your cotton trade is no worse than ours—you have everything that we had."

Stocks Back on Investment Basis

This picture is in sharp contrast with the gloom that continues to hang over the stock market. Deflation has been so drastic that representative common stocks are already back to prices only slightly more than ten times earnings and are yielding 6 per cent, according to a compilation by the Midland Bank of Cleveland covering 120 dividend-paying issues in ten important industries.

Growth in Structural Steel Sales

Increased Use and New Markets, Despite a Decline in Total Building Construction

STRUCTURAL steel was never selling better in the history of the country, declared Charles F. Abbott, executive director, in his report to the seventh annual convention of the American Institute of Steel Construction, meeting at Biloxi, Miss., Nov. 13. He pointed out that in 1921 some 1,188,600 tons of structural steel was sold in the United States, whereas this year the tonnage will probably exceed 3,950,000. This growth in the business has resulted despite the fact that there has been a decline of some 9 per cent from 1928 in all building operations during 1929.

Standard specifications and more rational use of structural steel promoted by the institute have in part effected this great change. Furthermore, there has been a tremendous increase in bridge building and aggressive work is being done toward promoting the use of steel in hangars, residences and dams. The time is now ripe, he said, to "rationalize output."

Stabilized Production Must Prevail

"The structural steel industry must understand and accept the theory of stabilized production," said Mr. Abbott. "It is only by an adjustment of supply to demand that prices can be stabilized or maintained at a given point. It is certainly the part of wisdom to have our resources of steel judiciously used, rather than to sell it very cheaply in bulk, with widespread waste and confusion.

"Fortunately, the steel construction industry, through the institute, is making a direct approach to the problem by first studying consumer interests and then adopting measures to meet them, which means a constantly increased use. As markets are extended and new uses developed, consumption will gradually exceed production facilities and thereby bring about rationalized output."

Large Merchant Iron Company Formed

Grouping of Toledo, Perry, Zenith and By-Product Coke Gives 1,100,000 Tons Annual Pig Iron Capacity

WITH an annual pig iron capacity of about 1,100,000 tons, one of the largest merchant pig iron producing companies in the country will be formed by the merger of four important Lake furnace interests operating six merchant blast furnaces, the Toledo Furnace Co., Toledo, Ohio, and the Perry Furnace Co., Erie, Pa., both controlled by Pickands, Mather & Co., and the By-Product Coke Corporation, Chicago, and the Zenith Furnace Co., Duluth. Lake Superior ore mines operated by Pickands, Mather & Co., with sufficient output to supply the new company with all of its iron ore requirements, will be included in the merger.

The linking of organizations that have been closely allied for several years will result in a company with approximately $75,000,000 in resources. All the merged companies have by-product coke ovens which supply gas to municipalities and districts in which they are located and plants for the recovery of by-products. The output of the furnaces will continue to be sold by Pickands, Mather & Co., Cleveland, and Pickands, Brown & Co., Chicago.

The Toledo Furnace Co. has two merchant stacks at Toledo, both with a daily capacity of 1200 tons; the By-Product Coke Corporation has two Federal stacks with an annual capacity of 300,000 tons, the Perry Iron Co. has one stack with an annual capacity of 125,000 tons, and the Zenith Furnace Co.'s one stack has a daily capacity of 300 tons.

The recently announced authorization of an increase in the capital stock of the By-Product Coke Corporation from 800,000 shares to 2,500,000 shares was the first step in effecting the merger of the four companies. Other details will be worked out shortly.

H. G. Dalton, partner in Pickands, Mather Co., is president of the Toledo Furnace Co. and he and Elton Hoyt, II, a partner in Pickands, Mather & Co., and Fayette Brown, president, Harvey H. Brown & Co., Cleveland, are directors of the By-Product Coke Corporation, of which C. D. Caldwell is president. Pickands, Mather & Co. has for some time been supplying the Chicago company with its iron ore requirements under a long term contract.

Nominating Committee Named by Foundrymen

The 1930 nominating committee of the American Foundrymen's Association was completed recently with the election of four members by a letter ballot of the association membership. Election judges canvassed 816 votes, declaring the following elected to the committee:

M. J. Evans, vice-president, Whiting Corporation, Harvey, Ill.
R. J. Doty, plant manager, Reading Steel Casting Co., Reading, Pa.
Wm. J. Grede, president, Liberty Foundry, Inc., Milwaukee.
T. H. Addie, president, American Manganese Bronze Co., Philadelphia.

In addition to four members elected annually, the by-laws of the association also provide that the nominating committee shall include the last three living past presidents of the A. F. A. The past presidents thus automatically members of the 1930 committee are A. B. Root, Jr., Hunt-Spiller Mfg. Corporation, Boston, senior past president and chairman of the committee; S. W. Utley, Detroit Steel Casting Co., Detroit, and S. T. Johnston, S. Obermayer Co., Chicago.

A meeting of the 1930 nominating committee will be held shortly after the first of the year, according to announcement by C. E. Hoyt, executive secretary. At that time the committee will consider suggestions from members of the association as to candidates for officers and directors.

New England Council to Meet

Governors of the New England States, editors and industrial leaders will be among the speakers at the Fifth New England Conference, to be held in Boston, Nov. 21 and 22.

Col. E. A. Deeds, chairman of the board of the Niles-Bement-Pond Co., and director of the United Aircraft & Transport Corporation; Henry D. Sharpe, president of the Brown & Sharpe Mfg. Co.; Col. Frederick H. Payne, president of the Greenfield Tap & Die Corporation; Howard Coonley, president of the Walworth Co., and E. F. Gay, National Bureau of Economic Research, Harvard University, will be speakers. The Hon. Charles Francis Adams, Secretary of the Navy, will address the conference.

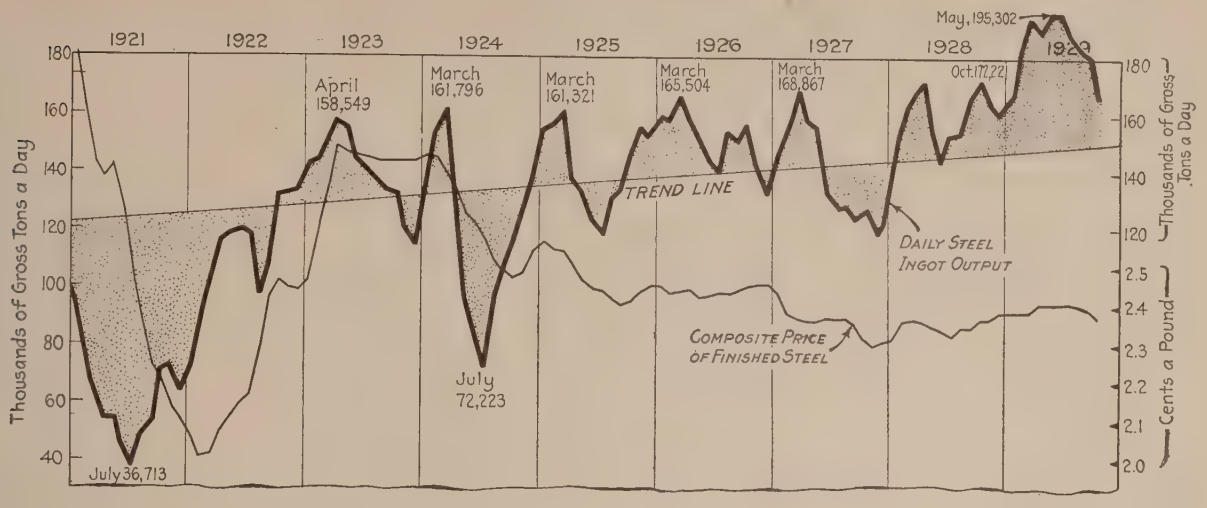
Electrochemists to Hear Address on Corrosion

Some of the fundamentals of corrosion, primarily from the viewpoint of the metallurgist, will be discussed by C. E. MacQuigg, manager, Union Carbide & Carbon Research Laboratories, Long Island City, N. Y., at the fall meeting of the New York Section of the American Electrochemical Society on Friday evening, Nov. 22. The meeting will be held at the Chemists' Club, 52 East Forty-second Street, New York, and will be preceded by a dinner at 6.45 p.m. The address will probably be supplemented by practical discussions from some of the leading metallurgists and electrochemists who have been interested in the solution of the corrosion problem.

Steel Founders to Meet

The Steel Founders' Society of America will hold its next regular meeting at Pittsburgh on Thursday, Dec. 12. This organization will also hold a regular meeting during the week of May 12, 1930, in Cleveland at the time the American Foundrymen's Association is having its annual convention there. Office of the society is at 932 Graybar Building, New York.

October Brings the Curve of Ingot Output Close to the Level of January, or More than 10 Per Cent Above Normal. Finished steel prices are about on parity with those a year ago



October Steel Ingot Output High

Ten Months' Production Exceeds Any Full Year Save 1928—Month's Daily Average Now Down Nearly to January Level

OCTOBER, with 27 working days, produced a tonnage of steel ingots slightly above September, with 25 working days. It brought the 10 months' total to a point nearly 15 per cent above the 10 months' output of 1928. This total for 10 months, in round numbers 47,755,000 gross tons, exceeds that for every full year save 1928.

The statistics are those of the American Iron and Steel Institute, and the calculations for the industry as a whole are based on the institute's returns from companies which made 94.51 per cent of the 1928 output. The accompanying table gives the figures for the past 22 months.

Last month there was a gain in output over September in Bessemer steel of about 1.4 per cent, which was not quite wiped out by the loss in the make of open-hearth steel. However, for the 10 months of this year the open-hearth production was some 15 per cent ahead of the same period of 1928 and the Bessemer output about 12.7 per cent ahead.

Daily averages, figured by eliminating Sundays from each month, show 167,098 tons for October, or 7.4 per cent off from the 180,435 tons of September. From the high point of May, exceeding 195,000 tons, the average daily output has now dipped nearly to the level of last January.

Electric and crucible ingots are not included in the current totals. Production of these two types of steel last year averaged about 1480 tons a day. Some such amount would have to be added to the daily figures in the table to obtain the total ingot output of the country.

The diagram traces the course of ingot production and finished steel prices over the period from the beginning of 1921.

PRODUCTION OF OPEN-HEARTH AND BESSEMER STEEL INGOTS
(GROSS TONS)

1928 Months	Reported by Companies Which Made 94.51 Per Cent of the Steel Ingots in 1928		Calculated Output of All Companies		No. of Working Days

Milwaukee Sheet Plant Makes Record

All previous shipping and production records were broken by the Inland Steel Co. of Wisconsin in October, when 7398 tons of finished material was turned out. This exceeded the August output of 7142 tons, the previous high mark.

Up to Oct. 31, this year, 2000 more tons had been produced than in all of 1928. A full time schedule is being maintained at the present time. The greater part of the sheet steel turned out goes to Wisconsin and Milwaukee industries.

Iron and Steel Markets

Railroad Buying Is Impressive

Large Orders for Rails and Equipment Placed As Caution Spreads Among Other Buyers—Steel Production Declines—Scrap Is Lower

HESITANCY is still marked among iron and steel buyers and both new business and production have undergone a further decline. In the main, apprehension regarding the consequences of the stock market collapse, rather than actual evidence of adverse effects, explains the attitude of the trade.

But this spirit is not universal. Railroad buying is conspicuously good and the requirements of farm equipment manufacturers continue to expand. Structural fabricating shops and shipyards, which are exceptionally well booked, are taking steel at a high rate. Manufacturers of steel pipe are bidding on an inquiry for 100,000 tons for a gas line to be laid by the Standard Oil Co. of California.

These indications of activity are counted on to restore general confidence and to release tonnage now held back. The present cautious policy of buyers is apparently not due to excessive inventories, because there is still pressure for deliveries against steel on order and suspensions of shipments are few and have come mainly from motor car builders.

The importance of railroad demand at this juncture is especially evident at Chicago, where 75 per cent of current specifications for finished steel are from the carriers and equipment builders. Rail buying came earlier than usual this year and much of the tonnage has been for fall shipment, tending to offset the reduced volume of business from other sources. The concentration of this rail tonnage, together with the large requirements of railroad car and locomotive builders, helps to explain the Steel Corporation's gain of 183,981 tons in unfilled orders in October.

The week's additions to rail bookings total 113,000 tons, of which 52,000 tons is for the Chicago & North Western, 23,000 tons for the Wabash, 15,000 tons for the Western Pacific, 8000 tons for the Kansas City Southern and the remainder miscellaneous lots. The Boston & Maine has entered the market for 10,000 tons, while the Southern Pacific is expected to take early action on its inquiry for 120,000 tons.

Freight cars ordered thus far in 1929 number 85,000, in addition to which railroads have placed 9000 cars with their own shops. Purchases for the year will probably run well over 100,000 cars, which would be the largest total since 1924. The Boston & Maine has bought 1500 cars, duplicating an order of a few weeks ago. The Union Tank Car Co. has purchased 1000. About 15,000 cars are pending, and additional inquiries for 20,000 cars are looked for before the end of the year. One large road has planned a three-year program, calling for the purchase of 10,000 steel box cars a year. Figures on the first 10,000 will be asked early in 1930.

Steel ingot production has declined to 60 per cent in the Valleys and to 75 per cent at Pittsburgh and Chicago. Eastern mills are operating at 65 to 80 per cent, the latter rate being that of the leading independent.

Finished steel prices show the strain of reduced demand, although in some lines the market remains untested because of the dearth of new business. Galvanized sheets are more commonly available at 3.40c., Pittsburgh, a decline of $2 a ton from the price heretofore quoted to others than jobbers. Sales of black sheets have been made at 2.70c., Pittsburgh, a concession of $1 a ton, while blue annealed sheets, which have been subject to severe competition from the continuous mill product, are openly quoted by some producers at 2.25c., Pittsburgh, for No. 13 gage and at 2.10c. for No. 10. Plates at Chicago have declined to a position of parity with bars and shapes.

Scrap, feeling the effects of curtailed consumption, is generally weaker. Heavy melting grade is $1 a ton lower at Pittsburgh and 50c. lower at Chicago.

Bookings in plates and shapes are important supports of mill operations in the East. Fabricating awards reported by the Structural Steel Board of Trade of New York for October were the second largest for any month on record, totaling 85,699 tons. Lettings reported from all districts this week aggregated 26,000 tons, which was slightly larger than the total for last week but below the average for the year.

In the pig iron market caution is as pronounced as among steel buyers. The prospect is that the beginning of next year will find melters with virtually no iron bought and producers with a minimum tonnage sold. Furnace stocks are low except in the Central West, where considerable deferred shipment iron, mainly for the automobile industry, is backing up. More surplus steel works iron is expected to reach the market and Alabama producers are not likely to abandon the Northern trade that they recently built up.

Steel ingot output in October, in terms of daily average, declined 7.4 per cent from the production of September. The rate, at 167,098 tons, was the lowest since January. October fell nearly 3 per cent below the corresponding month in 1928, being the first month of 1929 to have a smaller output than the same period last year.

THE IRON AGE composite prices are unchanged, pig iron at $18.38 a ton and finished steel at 2.362c. a lb.

On export business there are frequent variations from the above prices. Also, in domestic business, there is at times a range of prices on various products, as shown in our market reports on other pages.

Pittsburgh

Steel Orders Drop Further—Ingot Operations Reduced Also—Scrap Prices Break Sharply

PITTSBURGH, Nov. 12.—While steel orders have dropped off sharply in the last two weeks, specifications are reaching Pittsburgh and nearby mills in fair amount. In some cases, the tonnages released are somewhat smaller than they have been, but in few, if any, instances have shipments been entirely suspended. The importance of prompt delivery is being emphasized continually, but mills are in a position to meet such requirements and are inclined to regard the urgency for delivery as definite proof of low consumer inventories.

The sudden decline in steel demand is directly traceable to the recent stock market break and, in the absence of reliable estimates of just what the future course of general business will be, the steel industry is concerned with evaluating the potentialities of the large steel-consuming groups.

It is believed by some that the effect of the reduced automobile production is receiving overemphasis at this time. The two largest makers of cars in the low-priced field both expect to step up their production within the next month and will probably end the year with fairly heavy schedules. In both cases the cars to be produced represent model changes and the future course of production on these cars will depend upon public demand. Other automobile makers will probably maintain a sharply curtailed output for the remainder of the year.

Additional steel purchases by the railroads are not so certain, but car orders placed in the last 60 days have added a heavy tonnage to the backlogs of plate and sheet mills, against which shipment will be made well into the first quarter.

The agricultural implement industry continues to step up its production, and, as this is the season when peak production is reached, a good outlet for steel is promised. Implement makers generally feel that next year's demand from the farming industry has not been seriously impaired by recent financial happenings.

Shape and plate mills in this district are still fairly well occupied, and large construction projects on which fabricators are working will continue to require considerable steel. The Jones & Laughlin Steel Corporation has recently taken an order for 7000 tons of sheet steel piling for the Bonnett-Carre spillway in the lower Mississippi Valley and this is considered a forerunner of large steel tonnages which will be required for flood prevention work in that part of the country.

The pipe business has been dull in the last two weeks, but the Standard Oil Co. of California is inquiring for 80,000 tons of gas pipe in the larger sizes. Both lap-weld and seamless mills have thus far been able to maintain a fairly good operating rate.

Steel ingot operations continue to decline, with the average for the Pittsburgh district now about 75 per cent of capacity. The Valleys are at about 60 per cent and mills down the Ohio River are at no higher a rate.

Finishing mills generally average about the same as open-hearths, but the sheet industry as a whole is not above 60 per cent, with the leading interest about 10 points higher.

Tin plate production coincides roughly with sheets, but the 1930 price will probably be announced this

week and mills will soon begin to step up production on anticipated tonnage for next year. Strip mills are engaged at about half their capacity.

Prices are not strong, and concessions are reported in nearly all the principal lines. Upon investigation, most of these reports seem to emanate from buyers of steel. The hesitancy of these companies to place orders other than with their regular sources of supply indicates that prices are not as demoralized as they might seem and, with only small tonnages to quote on, the incentive for shading is lacking.

Makers of wire and wire nails have reaffirmed present quotations for first quarter business. Bars, shapes and plates seem to be holding at 1.90c., Pittsburgh, although this figure is not being tested by large tonnages. The 3.40c., Pittsburgh, price on galvanized sheets, which heretofore has been given only to jobbers, is growing more general, but otherwise sheet prices are not quotably lower. Cold-finishing mills have revised their contracts to meet the $2 a ton reduction announced last week. Strip prices are subject to some question, but are untested in a market of practically no buying.

Pig Iron.—Excepting a few sales of carload or slightly larger lots, this market is completely lifeless. Nevertheless, shipments are keeping up fairly well, and the leading merchant interest reports that its current output is all going into immediate consumption. Other merchant furnaces are piling very little iron, but two stacks are going out this week in order to keep stocks down. The Youngstown Sheet & Tube Co. is taking out one of its Hubbard furnaces, and one of the Shenango stacks is being banked. A large part of the output of both of these furnaces ordinarily goes to ingot mold plants, whose business has been sharply curtailed by reduced steel company operations. Prices are weak, but untested on large tonnages, with small lots bringing the full Valley furnace quotations of $18.50 on foundry and basic iron and $19 on malleable and Bessemer. The local merchant furnace is quoting prices 50c. a ton higher.

Prices per gross ton, f.o.b. Valley furnace:

Basic	$18.50
Bessemer	19.00
Gray forge	18.00
No. 2 foundry	18.50
No. 3 foundry	18.00
Malleable	19.00
Low phos., copper free	27.00

Freight rate to Pittsburgh or Cleveland district $1.76.

Prices per gross ton, f.o.b. Pittsburgh district furnace:

Basic	$19.00
No. 2 foundry	19.00
No. 3 foundry	18.50
Malleable	19.50

Freight rates to points in Pittsburgh district range from 63c. to $1.13.

Semi-Finished Steel.—Shipments of crude steel are lighter than they were during the greater part of October, as non-integrated steel companies are anxious to keep stocks at a minimum. Their operations are also rather light. Steel companies normally have large stocks of billets, slabs and sheet bars, and decreases in ingot production are being made in some plants to bring output in line with the lowest absolute needs. Prices are nominal, but the market on sheet bars, slabs and billets is still quotable at $35, Pittsburgh or Youngstown. Some users have contracts at this price, while large buyers are enjoying the usual differentials. Occasional sales of forging billets are reported, and the $40 price is holding on such transactions. Wire rods are also quotable at $40, Pittsburgh or Cleveland. Rod shipments are declining, as the requirements of bolt and nut makers are less than they were.

Bars, Shapes and Plates.—Demand for the heavy hot-rolled products leaves a good deal to be desired, but plate and shape mills are well engaged and extended rollings for large projects promise to hold output at close to the present level over the remainder of the year. Consumption of structural shapes by local fabricators is steady, and, while awards in the last two or three weeks have tended to slump, backlogs are satisfactory. Plate mills are not yet receiving specifications from the car builders in the amounts that had been expected, but, with freight cars on order approaching the highest total of the year, heavy specifications from this source are certain to appear. Shops served by Pittsburgh mills are booked for three or four months and reports persist that more large orders will be placed before the end of the year. Barge builders are now making deliveries regularly of barges booked early in the year and are reaching the point where they need additional orders. However, the shortage of barges on the rivers is self-evident and a number of interests are engaged in the formation of new lines which will take care of the growing river commerce. Railroads are mentioned as being interested in some of these projects and it seems certain that the barge business will benefit by this cooperative attitude. Bar mills are running at reduced rates and demand is not improving. The cold-finishing mills are taking a comparatively small percentage of their usual tonnage. Makers of farm implements are increasing their requirements, and builders of machinery and tools are still fairly large users. Prices are unchanged at 1.90c., Pittsburgh, on bars, shapes and plates, with occasional small lots bringing $1 a ton more.

Rails and Track Supplies. — Rail mill operations continue to improve and, as rail shipments gain, specifications for track accessories grow heavier. The Baltimore & Ohio has not yet made known its 1930 requirements for rails and track supplies, but most of the other Eastern roads have placed their business. Demand for light rails is keeping up and is particularly good in some of the coal regions where business is better than usual this year.

Wire Products.—With automobile and automotive parts makers taking only small tonnages, shipments of manufacturers' wire are less than they were during the corresponding October period. Other wire consumers are still taking their usual tonnage, but business is far from good, and demand from the jobbers is strictly of a hand-to-mouth character, involving very small lots. Prices seem to

Vitreous Enameling Stock

No. 24, f.o.b. Pittsburgh	3.90c.

Tin Plate

	Per Base Box
Standard cokes, f.o.b. P'gh district mills	$5.35
Standard cokes, f.o.b. Gary	5.45

Terne Plate

(*F.o.b. Morgantown or Pittsburgh*)
(Per Package, 20 x 28 in.)

8-lb. coating I.C.	$11.20
15-lb. coating I.C.	14.00
20-lb. coating I.C.	15.30
25-lb. coating I.C.	$16.70
30-lb. coating I.C.	17.75
40-lb. coating I.C.	19.85

Alloy Steel Bars

(F.o.b. makers' mill)

Alloy Quality Bar Base, 2.65c. to 2.75c. per Lb.

S.A.E. Series Numbers		Alloy Differential
2000	(½% Nickel)	$0.25
2100	(1½% Nickel)	0.55
2300	(3½% Nickel)	1.50
2500	(5% Nickel)	2.25
3100	Nickel Chromium	0.55
3200	Nickel Chromium	1.35
3300	Nickel Chromium	3.80
3400	Nickel Chromium	3.20
4100	Chromium Molybdenum (0.15 to 0.25 Molybdenum)	0.50
4100	Chromium Molybdenum (0.25 to 0.40 Molybdenum)	0.70
4600	Nickel Molybdenum (0.20 to 0.30 Molybdenum, 1.25 to 1.75 Nickel)	1.05
5100	Chromium Steel (0.60 to 0.90 Chromium)	0.35
5100	Chromium Steel (0.80 to 1.10 Chromium)	0.45
5100	Chromium Spring Steel	0.20
6100	Chromium Vanadium Bars	1.20
6100	Chromium Vanadium Spring Steel	0.95
9250	Silicon Manganese Spring Steel (flats)	0.25
	Rounds and squares	0.50
	Chromium Nickel Vanadium	1.50
	Carbon Vanadium	0.95

Above prices are for hot rolled steel bars, forging quality. The differential for cold-drawn bars is ¾c. a lb. higher, with standard classification for cold-finished alloy steel bars applying. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis.

Billets under 4 x 4 in. carry the steel bar base. Slabs with a sectional area of 16 in. or over carry the billet price. Slabs with sectional area of less than 16 in. or less than 2½ in. thick, regardless of sectional area, take the bar price.

Rails

	Per Gross Ton
Standard, f.o.b. mill	$43.00
Light (from billets), f.o.b. mill	36.00
Light (from rail steel), f.o.b. mill	34.00
Light (from billets), f.o.b. Ch'go mill	36.00

Track Equipment

	Base per 100 Lb.
Spikes, ⅞ in. and larger	$2.80
Spikes, ½ in. and smaller	2.80
Spikes, boat and barge	3.00
Tie plate, steel	2.15
Angle bars	$2.75
Track bolts, to steam railroads	$3.80 to 4.00
Track bolts, to jobbers, all sizes, per 100 count	70 per cent off list

Welded Pipe

Base Discounts, f.o.b. Pittsburgh District and Lorain, Ohio, Mills

Butt Weld

Steel Inches	Black	Galv.	*Iron* Inches	Black	Galv.
⅛	45	19½	¼ and ⅜	+11	+36
¼ to ⅜	51	25½	½	23	5
½	56	42½	¾	28	11
¾	60	48½	1 and 1¼	31	15
1 to 3	62	50½	1½ and 2	35	18

Lap Weld

2	55	43½	2	23	9
2½ to 6	59	47½	2½ to 3½	28	13
7 and 8	56	43½	4 to 6	30	17
9 and 10	54	42½	7 and 8	29	16
11 and 12	53	40½	9 to 12	26	11

Butt Weld, extra strong, plain ends

⅛	41	24½	¼ and ⅜	+13	+48
¼ to ⅜	47	30½	½	23	7
½	53	42½	¾	28	12
¾	58	47½	1 to 2	34	18
1 to 1½	60	49½			
2 to 3	61	50½			

Lap Weld, extra strong, plain ends

2	53	42½	½	29	13
2½ to 4	57	46½	2½ to 4	34	20
4½ to 6	56	45½	4½ to 6	38	19
7 to 8	52	39½	7 and 8	31	17
9 and 10	45	32½	9 to 12	21	8
11 and 12	44	31½			

On carloads the above discounts on steel pipe are increased on black by one point, with supplementary discount of 5%, and on galvanized by 1½ points, with supplementary discount of 5%. On iron pipe, both black and galvanized, the above discounts are increased to jobbers by one point with supplementary discounts of 5 and 2½%.

Note.—Chicago district mills have a base two points less than the above discounts. Chicago delivered base is 2½ points less. Freight is figured from Pittsburgh, Lorain, Ohio, and Chicago district mills, the billing being from the point producing the lowest price to destination.

Boiler Tubes

Base Discounts, f.o.b. Pittsburgh

Steel		*Charcoal Iron*	
2 in. and 2¼ in.	38	1½ in.	1
2½ in.—2¾ in.	46	1¾ in.	8
3 in.	52	2 in.—2¼ in.	13
3¼ in.—3¾ in.	54	2½ in.—2¾ in.	16
4 in.	57	3 in.	17
4½ in. to 6 in.	46	3¼ in. to 3½ in.	18
		4 in.	20
		4½ in.	21

On lots of a carload or more, the above base discounts are subject to a preferential of two fives on steel and of 10 per cent on charcoal iron tubes. Smaller quantities are subject to the following modifications from the base discounts:

Lap Welded Steel—Under 10,000 lb., 6 points under base and one five; 10,000 lb. to carload, 4 points under base and two fives. Charcoal Iron—Under 10,000 lb., 2 points under base; 10,000 lb. to carload, base and one five.

Standard Commercial Seamless Boiler Tubes

Cold Drawn

1 in.	61	3 in.	46
1¼ to 1½ in.	53	3¼ to 3½ in.	48
1¾ in.	37	4 in.	51
2 to 2¼ in.	32	4½, 5 and 6 in.	40
2½ to 2¾ in.	40		

Hot Rolled

2 and 2¼ in.	38	3¼ to 3½ in.	54
2½ and 2¾ in.	46	4 in.	57
3 in.	52	4½, 5 and 6 in.	46

Beyond the above base discounts a preferential discount of 5 per cent is allowed on carload lots. On less than carloads to 10,000 lb., base discounts are reduced 4 points with 5 per cent preferential; on less than 10,000 lb., base discounts are reduced 6 points, with no preferential. No extra for lengths up to and including 24 ft. Sizes smaller than 1 in. and lighter than standard gage take the mechanical tube list and discounts. Intermediate sizes and gages not listed take price of next larger outside diameter and heavier gage.

Seamless Mechanical Tubing

	Per Cent Off List
Carbon, 0.10% to 0.30%, base (carloads)	55
Carbon, 0.30% to 0.40% base	50

Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.

be much better, with both wire nails and plain wire quotable at 2.50c., Pittsburgh, in carload lots to the trade, while jobbers are getting the usual $2 a ton concession. Manufacturers' wire is quoted at 2.40c., Pittsburgh.

Tubular Goods.—The Standard Oil Co. of California has come into the market for 80,000 tons of 20, 22, 24 and 26-in. line pipe which will be required for a gas line running from the California gas field into San Francisco. Other than this the line pipe business is quiet. The projected gas line from the Texas fields into Chicago seems to have been postponed for the time being. Other lines of pipe are also inactive, and demand has weakened perceptibly during the last two weeks. In the case of standard butt-weld pipe, this decline is seasonal. The oil country is still disturbed by numerous conservation projects, some of which are expected to be of considerable benefit to the industry. Advanced prices on black and galvanized steel butt-welded pipe have been adopted by all producers who had previously granted concessions, the extra 2½ per cent supplementary discount having been withdrawn on all business.

Sheets.—This market is now facing seasonal curtailment in the requirements of a few large consuming industries as well as greatly reduced buying from the automobile makers. On the other hand, agricultural implement companies are regularly increasing their specifications and have given no indication of a belief that their next year's business will not be fully up to the high levels of the last two years. Car builders are also showing added interest in their sheet purchases, but have not yet released rolling orders on the bulk of the tonnage which is expected to reach sheet mills by the first of the year. The Ford Motor Co. has not yet completed its model revisions and its sheet orders are being delayed. Other makers of automobiles in the low-priced field are also postponing their commitments and companies which had planned improved output in November have curtailed production instead. This condition has naturally influenced the sheet business adversely. Demand for galvanized sheets has also declined as the roofing business closes its active season. Makers of electric refrigerators have become less important consumers, their season reaching its height in midsummer. One of the few industries which continues its heavy demand for sheets is the metal furniture business. Prices show no strength. On black sheets, most mills are quoting 2.75c., Pittsburgh, but sales have been made at 2.70c. The 3.40c. price on galvanized sheets, which has until recently been extended only to jobbers, is now applying on a growing number of sales to consumers. Some mills are openly seeking business in blue annealed at 2.10c. for the No. 10 gage and 2.25c. for the No. 13 gage.

Tin Plate. — Business is dormant, but, as the price for 1930 may be announced before the end of the week, it will not be long before specifications for next year's tonnage begin to reach the mills. Operations of the leading interest have dropped under 70 per cent of theoretical capacity for the first time in many months and the average for the independents is not higher than 60 per cent.

Strip Steel.—Demand for hot and cold-rolled strip steel is extremely dull and the industry's operating rate is not much above 50 per cent of capacity. Occasionally, specifications are sufficient for a slightly higher rate for a short time, but no general improvement is reported. The Chevrolet Motor Co. is soon expected to make known its requirements for the remainder of the year, but other motor companies are cautious buyers and the same is true of the parts makers. Prices are not quotably lower, although occasionally they are subject to shading. On hot-rolled material, the usual price is 2c., Pittsburgh, for material less than 6 in. wide and 1.90c., for 6 in. and wider. Cold-rolled strip is quoted at 2.75c., Pittsburgh or Cleveland.

Cold-Finished Steel Bars and Shafting.—Mills have marked down contracts on cold-finished steel bars to 2.20c., Pittsburgh, effective Nov. 1, and new business is being taken at that figure. The $2 a ton reduction did not stimulate buying, but a steady flow of light specifications is still reaching the mills, assuring a constant though light operating rate.

Coal and Coke.—Weakness and inactivity are the prominent characteristics of this market. Furnace coke is occasionally bringing $2.75 a ton, Connellsville, but $2.65 applies on all sizable tonnages and lower prices have been quoted. Production is still being curtailed in the Connellsville region. Domestic coke has not developed much life, but cold weather would undoubtedly stimulate business. Shipments of foundry coke to steel foundries are holding up, but tonnage going to other plants is only fair. The coal business seems to be slightly better than it was at this time last year, but industrial consumption is constantly decreasing and the movement to the Lakes is about ended for this year.

Old Material.—After maintaining some semblance of strength for two or three weeks, the scrap market in this district has broken sharply. The Pennsylvania Railroad steel brought from $16.50 to $17 last week, and, although this must be considered the market on No. 1 heavy melting steel in the absence of other transactions, it is generally admitted that further decline in values cannot be avoided. With the possible exception of the blast furnace grades, all items on the list are off about 50c. a ton, as compared with last week. Machine shop turnings are weak as the principal consumer is expected soon to hold up shipments. Specialties are also quotably lower at $20 to $20.50, but are strong at this range in contrast with the weakness of other grades. Holdups continue at several important consuming points and others plan restricted shipments. Dealers have practically exhausted old orders on which they have been shipping for the last two or three months, and it would be difficult to say what price a mill might get which came into the market for a large tonnage of scrap.

Prices per gross ton delivered consumers' yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$16.50 to $17.00
No. 2 heavy melting steel	14.50 to 15.00
Scrap rails	15.50 to 16.00
Compressed sheet steel	16.25 to 16.75
Bundled sheets, sides and ends	15.00 to 15.50
Cast iron carwheels	15.00 to 15.50
Sheet bar crops, ordinary	18.00 to 18.50
Heavy breakable cast	11.50 to 12.00
No. 2 railroad wrought	16.50 to 17.00
Hvy. steel axle turnings	15.50 to 16.00
Machine shop turnings	11.00 to 11.50
Acid Open-Hearth Grades:	
Railr. knuckles and couplers	20.00 to 20.50
Railr. coil and leaf springs	20.00 to 20.50

Chicago

Steel Orders Largely Supported by Rails and Car Requirements—Miscellaneous Buyers are Cautious

CHICAGO, Nov. 12.—The bulk of support given to the local iron and steel market is coming from the railroads. Fully 50 per cent of the volume of specifications for finished steel was issued by car builders and another 25 per cent is accounted for by new releases for standard-section rails. Western railroads have made definite inquiries for over 12,000 cars and there is in prospect, in some cases from railroads that bought cars earlier in the year, new requests for prices on 13,000 cars.

Changes in other phases of business are having no adverse bearing on equipment purchase programs. One instance of this is shown by the fact that the St. Louis-San Francisco, which originally asked for bids Nov. 17, accepted figures on the 11th of this month. New rail contracts have reached an impressive tonnage.

Taken as a whole, consumers of steel are using extreme caution in making commitments even for immediate use. This is reflected in the proportionately small part of current specifications entered by miscellaneous users this week. In some cases, consumers have cut too close and have had to supplement recent orders.

A leading radio manufacturer stopped all production activities last week with the intention of not resuming them until about the first of the year. This drastic move has already been modified and output has been started on a one-third capacity basis.

Several automobile manufacturers which recently swung into heavy production with new models have cut schedules to avoid overstocking new cars.

Structural awards, though light in the immediate vicinity of Chicago, are in substantial tonnage in the Central and Western States. Agricultural implement manufacturers are maintaining a high rate of production.

Ingot output at Chicago mills has failed to hold, and the average now is about 75 per cent of capacity. No. 4 stack at Gary has been banked, leaving 24 furnaces in blast out of a total steel mill count of 36.

Ferroalloys.—This market is quiet and tonnages placed are of such character as to afford little or no test of current quotations.

Prices delivered Chicago: 80 per cent ferromanganese, $112.56; 50 per cent ferrosilicon, $83.50 to $88.50; spiegeleisen, 19 to 21 per cent, $39.76 to $41.76.

Pig Iron.—Shipments of Northern iron have started to taper, but the rate is slow and as yet little opportunity has been afforded producers to enlarge furnace stocks that have been unusually small. Most users are showing caution both in making new commitments and in issuing releases against old contracts. Producers of Southern iron are taking a stand for higher prices. One furnace is said to have withdrawn all quotations and to have named prices at $13.50 to $14 a ton, Birmingham. Charcoal iron has moved in small lots at $24 a ton, furnace. Prices for silvery show no recovery from the recent low point. Sales this week have reaffirmed present quotations.

Prices per gross ton at Chicago:

N'th'n No. 2 fdy., sil. 1.75 to 2.25	$20.00
N'th'n No. 1 fdy., sil. 2.25 to 2.75	20.50
Malleable, not over 2.25 sil.	20.00
High phosphorus	20.00
Lake Super. charcoal, sil. 1.50	27.04
So'th'n No. 2 fdy. (all rail)	$19.01 to 19.51
Low phos., sil. 1 to 2, copper free	29.50
Silvery, sil. 8 per cent	$28.79 to 29.79
Bess. ferrosilicon, 14-15 per cent	46.29

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Sheets.—The effects of reduced tonnages of sheets released a week ago are now being felt at local mills, which have curtailed output to an average rate of 75 per cent of capacity. In view of the current rate of specifications, it is doubtful in the minds of some producers that this new rate of output can be maintained unless incoming business increases at an early date. Prices in the local market are holding moderately well, though competition is becoming increasingly severe, and there is a growing urge on local producers to reach out into a wider territory for business which must be taken at prices below local quotations. Deliveries show marked improvement and rolling schedules are more flexible than in many weeks. Galvanized sheets may be had in two to three weeks and other hot mill commodities are being promised in 10 days to two weeks. The manufacturing trade is taking sheets at extremely close range. Some believe this to be partly a reflection of the approach of the inventory period. Shipments of sheets to jobbers show little variation from the rate maintained in October.

Base prices per lb., deliv'd from mill in Chicago: No. 24 black sheets, 2.85c. to 2.95c.; No. 24 galv., 3.65c.; No. 10 blue ann'l'd, 2.35c. Deliv'd prices at other Western points are equal to the freight from Gary, plus the mill prices, which are 5c. per 100 lb. lower than Chicago delivered prices.

Cast Iron Pipe.—Inquiries and orders from municipalities are few, and there is little prospect of an early revival. Private buying is confined to small and scattered lots, but it is hoped by the trade that large inquiries for 1930 delivery to public utilities will develop in the early part of December. Current transactions do not afford tests of prices at $43.70 to $45.70 a net ton, delivered, Chicago, for diameters 6 in. and over. Genoa, Neb., has placed 10,000 ft. of 8-in. pipe with an unnamed bidder. Frank Wilsey, Hammond, Ind., will lay 7000 ft. of 6 and 8-in. gas pipe at Lowell, Ind.

Prices per net ton, deliv'd Chicago: Water pipe, 6-in. and over, $43.70 to $45.70; 4-in., $47.70 to $49.70; Class A and gas pipe, $3 extra.

Warehouse Business.—Orders received by warehouses continue to taper, but the rate downward is slow. In view of the total business already on books for this year and the general tendency at this time, warehouse operators do not expect that 1929 will show a volume of business equal to that of the previous year. Prices generally are steady, with the exception of quotations on nails.

Cold-Rolled Strips.—Prices have settled to 2.75c. a lb., Cleveland, or 3.05c., delivered, Chicago. New business is light and output is at the low point of the year.

Rails and Track Supplies.—New orders for standard-section rails total more than 80,000 tons. The Chicago & North Western has ordered 52,000 tons, of which 36,000 tons was taken by the Illinois Steel Co. and 16,000 tons by Inland Steel Co. The Western Pacific is reported to have placed 15,000 tons with the Colorado mill, and miscellaneous orders in the Chicago territory total 15,000 tons. A part of this last tonnage is an addition to a new contract and another part is tonnage which is being added to a 1929 rail contract. It is reported here that the Southern Pacific will buy its 120,000 tons of rails this week. It is expected that orders will be placed in Colorado and in the South. Local rail mill operations are steady, with sufficient tonnage lined up to sustain the current rate to the end of the year. Miscellaneous orders for track supplies total 6000 tons, the bulk of which is for immediate needs. Fresh inquiries total 20,000 tons for accessories that will go with 1930 rails now being rolled. Prices for tie plates are showing a variation of $1.50 a ton, the range in quotations being $41.50 a ton

Warehouse Prices, f.o.b. Chicago

	Base per Lb.
Plates and structural shapes	3.10c.
Soft steel bars	3.00c.
Reinforc'g bars, billet steel	1.90c. to 2.25c.
Reinforc'g bars, rail steel	1.85c. to 2.00c.

Hot-pressed nuts, sq., tap. or blank	60
Hot-pressed nuts, hex., tap or blank	60
No. 8 black ann'l'd wire, per 100 lb.	$3.45
Com. wire nails, base per keg	$2.75 to $2.95
Cement c't'd nails, base per keg	2.75 to 2.95

to $43. The lower prices are being quoted to meet competition which develops when the purchaser serves territory surrounding two steel producing centers. The light rail market is without feature.

Prices f.o.b. mill, per gross ton: Standard section open-hearth and Bess. rails, $43; light rails, rolled from billets, $36. *Per lb.:* Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.07½c. to 2.15c.; angle bars, 2.75c.

Reinforcing Bars.—Prices for reinforcing bars continue to drag bottom, with further weakness shown in quotations on rail steel. On attractive business new billet bars are commonly quoted at 1.90c. a lb., Chicago warehouse, and rail steel reinforcing bars can be had at 1.85c. a lb. Feeble attempts to bolster prices have been without effect. Shop backlogs are shrinking and operations by most bar benders are at a lower stage than at the beginning of the month. The credit situation is giving trouble, and sellers find collections considerably more difficult to make. Fresh inquiry is below normal for this time of the year.

Wire Products.—Demand from the manufacturing trade continues to grow lighter, and wire mill output has been cut to a range of 55 to 60 per cent of capacity. With open weather still prevailing over much of the country, the demand for wire goods by jobbers and retailers is heavier than usual at this time of the year. Shipment of electrical wires is steady except to manufacturers of radio equipment. Demand for wire rope is steady and order books for heavy electrical cables are well filled to the end of the year.

Plates.—Prices for this commodity have settled to a flat 2c. a lb., Chicago, except for small tonnages that are of the less desirable kind. Shipments have been cut rather sharply, owing in large measure to the lessened need of plates for the manufacture of steel pipe. A bright spot in this market is the demand for car material, which this week totaled 50 per cent of the aggregate of finished steel specifications. Much of the 85,000 to 100,000 tons of steel needed for the Santa Fe cars has been placed. Orders for tank plates are small, at not more than 1000 tons. Fresh inquiry from the Oklahoma fields is for 5000 tons in one lot. Deliveries are at close range and rolling schedules are flexible, so that most buyers' immediate needs can be met promptly. Pending railroad car business is moving slowly, but according to the view taken by the trade is steady.

Structural Material.—New contracts placed this week are largely for highway bridge work for erection at points widely scattered throughout the Western part of the country. Locally, there is little to brighten the outlook. New bids are being asked for the 5000 tons needed for a traction company's bridge at Indianapolis. Figures to be submitted this week are to include prices for erection. Plans for the $15,000,000 Chicago Postoffice are said to be nearing completion and soon will be submitted to Washington. Lake shore protection improvements, made necessary by the high water level in Lake Michigan, give promise of the use of much steel piling. Structural shapes are being quoted at 2c. a lb., Chicago.

Mill prices on plain material, per lb.: 2.00c. base, Chicago.

Bars.—Prices for bars have settled to the low figure of the range quoted a week ago. Mild steel bars will not bring above 2c. a lb., Chicago, except for the less desirable class of business. Specifications are lighter than a week ago and deliveries on most sizes are prompt. Common quotations for iron bars are 2c. a lb., Chicago. The bulk of new business, which is fairly steady in volume, is being placed by railroads and car builders. The alloy steel bar market is quiet, with prices untested at 2.65c. to 2.75c. a lb., base. New buying of rail steel bars is at close range, and the bulk of going tonnage is being taken at 1.90c. a lb., Chicago Heights. Specifications closely match shipments, which still afford double turn operations at local mills.

Bolts, Nuts and Rivets.—Specifications are a trifle lighter from builders of automobiles. Jobbers and manufacturers of farm implements find steady use for these commodities.

Coke.—Producers are being hard pressed for shipments of by-product foundry coke. Prices are steady at $8 a ton, local ovens.

Old Material.—Prices for scrap iron and steel have given ground in the last week and the tendency in many grades, in which the supplies are well above consumption, is still downward. Heavy melting steel, on business that aggregated close to 15,000 tons, has been sold at $14 a gross ton, delivered. Iron rails and 2-ft. steel rails are marked down $1 a ton. The cast iron borings market is at a standstill, with brokers being able to draw freely against available supplies at 25c. a ton below their prices of a week ago. It is evident that most heavy tonnage users have of late been accumulating stocks and their commitments are ample for immediate needs. Shipments of heavy melting steel to mills are about 25 per cent of the normal flow at this time of the year, while borings and hydraulic bundles are moving in even lighter proportionate tonnage. Small users and melters of specialties are buying with greater care and at closer range and also at lower prices. Few speculative transactions are being made by brokers, who prefer at this time to trade on an even basis for tonnages which they feel they can ship in the very near future. Prices paid for railroad scrap show variation, but the general level is well below that of several weeks ago. When bidders wish to rush through tonnages on orders which they fear may be cancelled, going prices to railroads are about equal to present market quotations. However, the bulk of tonnage is not for this purpose and prices generally are such that a fair margin of profit can be realized at the present market. Railroad scrap lists are impressive in aggregate tonnage. The Milwaukee road, the Chicago Great Western, Pere Marquette, Wabash, Rock Island and the Monon all have tonnages to sell.

Prices deliv'd Chicago district consumers:

	Per Gross Ton	
Basic Open-Hearth Grades:		
Heavy melting steel	$13.25 to	$13.75
Shoveling steel	13.25 to	13.75
Frogs, switches and guards, cut apart, and misc. rails	14.00 to	14.50
Hydraul. compressed sheets	11.50 to	12.00
Drop forge flashings	10.75 to	11.25
No. 1 busheling	11.50 to	12.00
Forg'd cast and r'l'd steel carwheels	18.00 to	18.50
Railroad tires, charg. box size	18.00 to	18.50
Railroad leaf springs cut apart	18.00 to	18.50
Acid Open-Hearth Grades:		
Steel couplers and knuckles	16.50 to	17.00
Coil springs	19.00 to	19.50
Electric Furnace Grades:		
Axle turnings	12.75 to	13.25
Low phos. punchings	15.25 to	15.75
Low phos. plates, 12 in. and under	15.25 to	15.75
Blast Furnace Grades:		
Axle turnings	11.50 to	12.00

Brake shoes	10.25 to	10.75

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

Canadian Steel Is to Build Tin Plate Mill

The Canadian Steel Corporation, Ojibway, Ont., is contemplating the construction of a tin plate mill there to cost $1,000,000, according to a statement by Ward B. Perley, president of the corporation. Mr. Perley said that the Canadian organization had been planning such a unit for some time. The Canadian plant is operating chiefly a wire mill.

New York

Structural Steel Tonnage in October a Record—Sheet Prices Weaker—Pig Iron Buyers Cautious

NEW YORK, Nov. 12.—Pig iron sales for the week totaled less than 4000 tons, reflecting the extreme caution now prevalent among buyers. Merchant furnaces are not burdened with stocks, but, with consumers staying out of the market, it is not unlikely that Jan. 1 will find most buyers without any iron bought and producers with very little iron sold. Melters are disposed to defer action on their needs both because of the uncertainties introduced by the stock market crash and the possibility of larger offerings of surplus steel company iron. Steel producers operated throughout the first eight months of the year with virtually no reserves of pig iron. Now that they have had an opportunity to replenish these reserves there is reason to expect that more of their iron will find its way into the market. It is easier to put out open-hearth furnaces than blast furnaces; hence pig iron production is not so quick to adjust itself to reduced steel-making requirements. There are also indications that Alabama furnaces will not abandon the Northern trade they recently built up without attempting to keep pace with competition. The condition that prompted their invasion of the North, i.e., a slump in the requirements of Southern cast iron pipe shops, has not changed for the better. The American Locomotive Co. has bought 500 tons of foundry iron from a Buffalo furnace for spot shipment to its Schenectady, N. Y., plant. The activity of the railroad equipment plants is one of the bright spots of the present situation. Melt generally is rather well maintained and there have been few suspensions of pig iron shipments. Here and there some of the smaller jobbing shops are reducing operations and one large New York State manufacturer making domestic appliances has curtailed foundry production. With inquiries few, prices are getting very little test. On Buffalo foundry iron, $17.50, furnace, is still the usual minimum on No. 2 plain, although silicon differentials are occasionally waived on the higher grades. William R. Thropp & Sons, Trenton, N. J., are in the market for 200 tons of No. 2X.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil. 1.75 to 2.25	$22.41 to $22.91
*Buf. No. 2, del'd east. N. J.	20.78 to 21.28
East. Pa. No. 2 fdy., sil. 1.75 to 2.25	19.89 to 21.02
East. Pa. No. 2X fdy., sil. 2.25 to 2.75	20.39 to 21.52

Freight rates: $4.91 from Buffalo, $1.39 to $2.52 from eastern Pennsylvania.

*Prices delivered to New Jersey cities having rate of $3.28 a ton from Buffalo.

Finished Steel.—Orders for steel placed with local sales offices in the past week were generally in larger volume than in the previous week. While the steel demand is not active, there has been a smaller decline in business than some had expected. The Bethlehem Steel Co. continues to operate at about 80 per cent, orders for structural steel, plates and rails accounting in large measure for the maintenance of this rate. The Fore River yard of the Bethlehem Shipbuilding Corporation now has every one of its ways occupied by ships in course of construction, the first time that this has happened in years. Considerable steel for these ships is being rolled by Bethlehem mills. Building construction in the New York district is taking steel in large volume. Although awards in the past week were in lesser aggregate volume than in preceding weeks, the mills have large orders for plain material on their books resulting from the record-breaking tonnage awarded in October. The Structural Steel Board of Trade of New York reports that October bookings by members and non-members of all types of work exclusive of civil engineering projects totaled 85,699 tons, as compared with 54,119 tons in September and 50,264 tons in October, 1928. Previous high monthly records this year were 74,566 tons in August and 72,003 tons in March. Only once since the Structural Steel Board of Trade was organized has the October record been surpassed and that was due to special circumstances. In November, 1925, the total was 112,000 tons. Price developments, particularly in sheets, tend toward weakness. Although most sellers are quoting and getting 2.75c. for black sheets, some sales have been made at $1 a ton less. The 3.40c. price on galvanized sheets, hitherto rated as a special concession to jobbers, has been extended in many instances to manufacturing consumers. Blue annealed sheets, which have been subject to severe competition from the continuous mill product, are being openly quoted by some mills at 2.25c., Pittsburgh, for the No. 13 gage and at 2.10c. for No. 10, concessions of $2 a ton from the prices which prevailed for many months. Throughout the steel list other prices are holding fairly well, although a quotation of 2c., Coatesville, on plates is becoming commoner, but at the same time the Eastern mills are also getting orders at 2.05c., Coatesville base.

Mill prices per lb., deliv'd New York: Soft steel bars, 2.24c. to 2.29c.; plates, 2.17½c. to 2.22½c.; structural shapes, 2.14½c.; bar iron, 2.14c.

Reinforcing Bars.—The stock market crash has had no noticeable effect on reinforcing business and in the long run is expected to have a favorable influence. Numerous jobs that had been held on architects' boards pending an easing in money rates will probably now be released. Warehouse business is holding up and thus far this year has shown an appreciable gain over the same period in 1928. Prices remain at 2.05c., New York.

Warehouse Business.—Demand for sheets continues fairly active, but prices are still subject to shading. Structural steel buying is light.

Cast Iron Pipe.—While Northern makers of pressure pipe are maintaining a fairly high rate of operation on the large sizes, tonnage is needed in pipe 12-in. and smaller. Certain

Warehouse Prices, f.o.b. New York

	Base per Lb.

No. 26	4.90c. to 5.00c.
No. 28*	5.15c. to 5.25c.
No. 30	5.55c. to 5.65c.

*No. 28 and lighter, 36 in. wide, 20c. higher per 100 lb.

Southern producers are barely able to maintain a low rate of operation and are seeking new business. Prices continue irregular, with most of the current small buying in this district at $32 to $33 a ton, f.o.b. foundry. No municipal inquiries are reported and not much buying from this source is expected until late this year or early in January.

Prices per net ton deliv'd New York: Water pipe, 6-in. and larger, $34.60 to $36.60; 4-in. and 5-in., $37.60 to $39.60; 3-in., $44.60 to $46.60. Class A and gas pipe $3 extra.

Coke.—Prices of standard furnace coke eased off slightly last week as a result of some substantial tonnages of this grade offered for prompt shipment at $2.65 a net ton and less by an operator in the Connellsville district who had received a request for postponement of delivery on a contract with a large user. Special brands of beehive foundry coke are quoted at $4.85 a net ton, ovens. By-product foundry coke is quoted at $9 to $9.40 a net ton, Newark or Jersey City, and $10.06, New York or Brooklyn.

Old Material. — Dealers' buying prices on No. 1 heavy melting steel have been reduced to $14.50 a ton, delivered eastern Pennsylvania, based on an order for upward of 10,000 tons at $15, delivered Bethlehem, Pa. Meanwhile, brokers with old contracts for No. 2 heavy melting steel, which they have not yet completed, are paying up to $13.50 a ton, delivered, although most of the tonnage moving is at $12.75 a ton, Harrisburg, Pa., and $13 a ton, delivered Phoenixville, Pa. Specification pipe is off 50c. a ton, with dealers paying $13.50 a ton, delivered. Most other grades have declined 25c. to $1 a ton on the basis of recent purchases by brokers and a minimum volume of consumer buying.

Dealers' buying prices per gross ton, f.o.b. New York:

No. 1 heavy melting steel	$11.00 to	$11.85
Heavy melting steel (yard)	8.00 to	9.50
No. 1 hvy. breakable cast.	10.25 to	11.00
Stove plate (steel works)		8.00
Locomotive grate bars		8.25
Machine shop turnings	7.00 to	7.50
Short shoveling turnings	7.25 to	7.50
Cast borings (blast fur. or steel works)	7.00 to	7.50
Mixed borings and turnings	6.75 to	7.50
Steel car axles	16.75 to	17.25
Iron car axles	22.00 to	22.50
Iron and steel pipe (1 in. dia., not under 2 ft. long)		9.75
Forge fire	8.50 to	9.00
No. 1 railroad wrought	12.00 to	12.50
No. 1 yard wrought, long	11.00 to	11.50
Rails for rolling	12.00 to	12.50
Stove plate (foundry)	8.25 to	9.00
Malleable cast (railroad)	13.50 to	14.00
Cast borings (chemical)	9.00 to	9.50

Prices per gross ton, deliv'd local foundries:

No. 1 machry. cast	$15.50 to	$16.00
No. 1 hvy. cast (columns, bldg. materials, etc.), cupola size	13.50 to	14.00
No. 2 cast (radiators, cast boilers, etc.)	13.00 to	13.50

Cleveland

Further Slowing Down in Steel Demand—Outlook in Automotive Industry Has Not Brightened

CLEVELAND, Nov. 12.—There was a further slowing down in the demand for finished steel the past week, and some of the mills again curtailed operations. The automotive industry continues to mark time and its view of the outlook is not very optimistic. Because of various unfavorable factors that have developed, the time that that industry expects a revival in production has now been extended until February.

Hesitancy prevails in the industry, and some of the motor car manufacturers that had planned to start manufacturing their new models this month apparently have not yet decided when they will go ahead. Shipments have been deferred on considerable steel for this industry scheduled for November delivery, although one maker of low-priced cars continues to take sheets for the manufacture of 160,000 cars according to its November-December schedule.

Motor car manufacturers are still confronted with unsold stocks of old models, which are moving very slowly, their sale having been seriously affected by the stock market collapse. Probably the brightest spot in the present unfavorable situation in respect to the motor car industry is that inventories are exceedingly low. This is also true of industries outside of the automotive field.

Consumers needing steel are ordering only in very small lots for immediate requirements. Hesitancy that prevails in the automotive industry has spread to other industries in the metal-working field, resulting in some curtailment in plant operations.

Pig Iron.—A little interest has developed in first quarter contracts, one producer having received inquiries during the week for a few lots aggregating 3000 tons for that delivery. Current sales are light and confined mostly to small lots, coming from foundries that had not previously bought enough iron to carry them through the year. Sales by Cleveland interests during the week totaled 8700 tons, or slightly less than during the previous week. One producer has shipped a little more iron so far this month than during the corresponding period in October, but another reports a falling off in shipments this month. While there has been a slight increase in shipping orders from one or two automobile foundries, the movement of iron to this industry is still very light and considerable deferred shipment iron is backing up at the blast furnaces. There has also been a slowing down in shipments to other industries. The market is holding steady at regular quotations of $18.50, Cleveland, for foundry and malleable grades for out-of-town shipment and $19, furnace, for local delivery. In Michigan, there is a spread of from $19.50 to $20.

Prices per gross ton at Cleveland:

N'th'n fdy., sil. 1.75 to 2.25	$19.50
S'th'n fdy., sil. 1.75 to 2.25	$20.50 to 21.00
Malleable	19.50
Ohio silvery, 8 per cent	28.00
Basic Valley furnace	18.50
Stand. low phos., Valley	26.50 to 27.00

Prices except on basic and low phosphorus are delivered Cleveland. Freight rates: 50c. from local furnaces; $3 from Jackson, Ohio; $6 from Birmingham.

Iron Ore.—Ore firms are cleaning up their shipments for the season, and the movement will be light the latter part of the month. Ore on Lake Erie docks Nov. 1 amounted to 6,365,342 tons, compared with 6,472,840 tons on the same date last year. Receipts at these docks for the season to Nov. 1 were 42,627,849 tons, compared with 33,343,785 tons during the same period last year. Shipments from Lake Erie docks to Nov. 1 were 30,886,416 tons, against 23,526,093 tons during the corresponding period in 1928. Receipts at Lake Michigan and other receiving ports other than Lake Erie ports until Nov. 1 were 17,105,832 tons, against 14,900,813 tons during the same period a year ago.

Semi-Finished Steel.—Specifications against contracts, which have been light for some time, show no improvement. Some of the mills would be glad to make sales, but there is no demand. The leading local producer continues to operate eight of its 14 open-hearth furnaces. Shipments are being made against $35 contracts for sheet bars, billets and slabs.

Bars, Plates and Shapes.—Steel bars are in very light demand, and local mills are operating at not over 60 per cent of capacity. Plates are moving fairly well in small lots. Detroit will take bids this week for a pipe line requiring 1500 tons, cutting its original inquiry from 4500 tons, having decided to do only a portion of its pipe line extension work at present. Structural shapes are quiet, and there is not much building work up for figures. Inquiries are out for highway bridge work in Ohio, western New York and Pennsylvania requiring several hundred tons. While a 1.85c., Cleveland, price is occasionally reported on steel bars, 1.90c. is

Warehouse Prices, f.o.b. Cleveland

	Base per Lb.
Plates and struc. shapes	3.00c.

No. 9 gal. wire, per 100 lb.	3.00
Com. wire nails, base per keg	2.65

*Net base, including boxing and cutting to length.

being maintained by most mills. Pressure is being encountered for concessions to 1.90c., Pittsburgh, on structural shapes and plates. However, the 1.95c. price is being pretty generally adhered to.

Sheets.—Mills entered very little tonnage during the week either in new business or in specifications against contracts. Automobile body sheets are the quietest item on the list. One automobile manufacturer sent out an inquiry during the week for a good-sized lot and later withdrew it. Independent mills have further reduced production and are operating at the most from 50 to 65 per cent. Mills making common black and galvanized sheets are running better than those that specialize on high-finished sheets. Orders are not of sufficient size to test prices. Black sheets are holding at 2.75c., Pittsburgh. Blue annealed sheets are not firm, concessions being made to 2.10c. for No. 10 and 2.25c. for No. 13. Galvanized sheets are generally quoted at 3.50c.

Strip Steel.—The tendency in the demand still appears to be downward, and little improvement is looked for until there is a revival in orders from the automotive industry. Operations are spotty. Some mills are running at about 50 per cent of capacity and others are near the closing down point. While hot-rolled strip is holding to regular quotations, it is not improbable that a good inquiry might bring out a concession. Shading to 2.65c., Cleveland, is reported occasionally on cold-rolled strip.

Warehouse Business.—Sales have fallen off in about all lines this month, as compared with the early part of October. This reflects a slowing down of consuming industries. Prices are well maintained. Jobbers have not followed the mills in making a $2 a ton reduction on cold-finished steel bars and it seems improbable that a change will be made.

Warehouse Prices, f.o.b. Philadelphia

	Base per Lb.
Plates, ¼-in. and heavier	2.70c.

†For 50 bundles or more; 10 to 49 bun., 4.95c. base; 1 to 9 bun., 5.30c. base.

Bolts, Nuts and Rivets.—Bolt and nut orders so far in November have been in about the same volume as in October, which, because of the reduced orders from the automotive industry, was the poorest month of the year. Prices are being well maintained, although there is some shading on special bolts for the automotive industry. Rivet demand shows a slight gain over last month due to better orders from shipbuilders. The industry is operating at about 60 per cent of capacity.

Coke.—Mild weather has interfered with shipments of domestic coke and has checked new buying. Foundry coke is not moving very well owing to some curtailment by the foundry industry. Prices are unchanged. Ohio by-product foundry coke is quoted at $8.25, ovens.

Old Material.—There has been further holding up of scrap shipments by Cleveland and Valley district consumers. Only one local mill is at present taking any scrap and that in steel-making grades in rather limited quantities. Inability to make shipments has driven dealers out of the market and they are not buying scrap of any grade. The existing situation is reflected in a weak market. However, in the absence of transactions quotations are nominal.

Prices per gross ton delivered consumers' yards:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$14.50 to $15.00
No. 2 heavy melting steel	14.25 to 14.50
Compressed sheet steel	14.75 to 15.25
Light bundled sheet stampings	12.00 to 12.50
Drop forge flashings	13.00 to 13.25
Machine shop turnings	10.00 to 10.25
Short shoveling turnings	11.50 to 12.00
No. 1 railroad wrought	13.50 to 14.00

Rails for rolling	16.25 to 16.50

Philadelphia

Steel Prices Lack Strength—Heavy Melting Scrap Declines —Pig Iron Market Quiet

PHILADELPHIA, Nov. 12.—Consumers of steel show no inclination to alter their attitude of delaying purchases to determine, if possible, what effect the unsettled stock market may have upon their business. Meanwhile, mill backlogs are steadily decreasing and operating rates of eastern Pennsylvania mills range from about 65 per cent to 80 per cent. Prices generally lack strength, but sellers are endeavoring to maintain the market on small tonnage buying, which constitutes most of the present business, offering concessions only to the larger, preferred buyers.

Eastern Pennsylvania shipbuilders are well engaged and are bidding on some new contracts for ship construction, but railroad buying is on a smaller scale than earlier in the fall. The Boston & Maine Railroad is expected to close shortly on 10,000 tons of 100-lb. and 130-lb. rails.

The pig iron market is quiet, and most prices of iron and steel scrap show a tendency toward further decline.

Pig Iron.—Foundry iron buying is limited to small lots, few consumers showing any desire to provide for their requirements beyond a few weeks. On such business, prices are being fairly well maintained at $21, furnace, with only occasional small concessions in the immediate Philadelphia district. On business outside this territory, however, where competition is encountered from furnaces in other districts, concessions range up to several dollars a ton. The Baldwin Locomotive Works is in the market for 750 to 1000 tons of cylinder iron for delivery beginning the second week in December at the rate of 50 to 100 tons a week. The Newport News Shipbuilding & Dry Dock Co. is inquiring for a carload of No. 2X foundry iron for shipment before the end of the month. The Brooklyn Navy Yard is asking for 200 tons of low phosphorus iron, and the New York Air Brake Co., Watertown, N. Y., is in the market for 400 tons of malleable and 250 tons of No. 2 plain foundry iron. The Virginia furnace, which has been offering foundry iron in the Cumberland Valley at competitive prices, has not closed any substantial business, as most consumers have already covered their requirements to the end of the year. Basic iron users in this district have not yet bought, but a Claymont, Del., mill has been obtaining prices. A Coatesville, Pa., consumer has about 3000 tons of Southern basic iron in transit by barge from the Birmingham district.

Prices per gross ton at Philadelphia:

East. Pa. No. 2, 1.75 to 2.25 sil.	$21.26 to $21.76
East. Pa. No. 2X, 2.25 to 2.75 sil.	21.76 to 22.26
East. Pa. No. 1X	22.26 to 22.76
Basic (del'd east. Pa.)	19.75 to 20.25
Gray forge	20.00 to 20.50
Malleable	21.25 to 21.75
Stand. low phos. (f.o.b. N. Y. State furnace)	22.00 to 23.00
Cop. br'g low phos. (f.o.b. furnace)	23.50 to 24.00
Va. No. 2 plain, 1.75 to 2.25 sil.	22.29
Va. No. 2X, 2.25 to 2.75 sil.	22.79

Prices, except as specified otherwise, are deliv'd Philadelphia. Freight rates: 76c. to $1.64 from eastern Pennsylvania furnaces; $4.54 from Virginia furnaces.

Bars.—Buying is limited to occasional small lots of a carload or less. Since the reduction of price to 1.90c., Pittsburgh, or 2.22c. per lb., delivered Philadelphia, the market is being maintained, present orders being too small to bring any concession from this level.

Reinforcing Bars. — Some sizable tonnages of bars will be required for projects on which bids have been taken, but new business has been light. The price situation is unchanged, with billet steel bars quoted at 1.95c. to 2c., Pittsburgh, or 2.27c. to 2.32c., delivered Philadelphia, and usually no extra for cutting to length. Rail steel bars are quoted at 1.85c. to 1.95c., Franklin, Pa., and Tonawanda, N. Y., or 2.17c. to 2.27c., delivered Philadelphia, with no extra for cutting to length or bending.

Shapes.—Mills are still fairly well engaged and able to maintain fair operations, but the tonnage in the individual rollings is smaller than for some time. Prices show a slightly more definite trend toward a lower level, and one seller has been quoting 1.855c. per lb., Pencoyd, Pa., or 1.915c., delivered Philadelphia, on desirable business. On small lots, the market ranges up to 1.95c., Pencoyd, or 2.01c., Philadelphia. Bids were opened today on the general contract for the new convention hall in Philadelphia, which requires 7000 tons, and the low bidder for the building was McCloskey & Co., Philadelphia. The total bid was considerably in excess of the original estimate.

Plates.—Although 2c., Coatesville, Pa., or 2.10c., Philadelphia, is being quoted on plates, mills in this district are seeking to limit this concession to the more desirable orders, and are quoting 2.05c., Coatesville, or 2.15c., delivered Philadelphia, on the smaller lots, which represent a considerable part of present buying. Operating rates of plate mills are slightly better than the rates maintained by mills rolling other products, but the highest is not more than 75 per cent of capacity. Shipbuilding orders have provided some substantial tonnages on mill books and more business from this source is expected.

Sheets.—Operations of leading local consumers of sheets are still greatly restricted, but automobile body builders which have contracts with leading makers have recently been testing the market on blue annealed and high-finished sheets and expect to begin production of new models shortly. Radio manufacturers are entering their usual dull season and have curtailed their output accordingly. Sheet prices have been shaded on recent business, so that black sheets range from 2.70c. to 2.75c., Pittsburgh, or 3.02c. to 3.07c., Philadelphia, and galvanized are quoted at 3.40c., Pittsburgh, or 3.72c., Philadelphia. Blue annealed sheets have been sold at 2.25c., Pittsburgh, or 2.57c., Philadelphia, for No. 13 gage, and blue annealed plates at 2.10c., Pittsburgh, or 2.42c., Philadelphia, for No. 10 gage. Eastern Pennsylvania sellers are endeavoring to quote these prices only on the larger orders from automobile builders and other preferred buyers, maintaining 2.35c., Pittsburgh, for No. 13 gage sheets and 2.20c., Pittsburgh, for No. 10 gage plates, on small orders and the miscellaneous specifications of jobbers.

Imports.—In the week ended Nov. 9, a total of 3449 tons of pig iron arrived at this port, of which 1949 tons came from British India and 1500 tons from the United Kingdom. A total of 4650 tons of chrome ore was received from Portuguese Africa. Steel imports consisted of 11 tons of drill steel from Sweden and 4 tons of scrap from the United Kingdom.

Old Material.—No. 1 heavy melting steel has declined another 50c. a ton to $15, delivered eastern Pennylvania, following purchase of upward of 15,000 tons of this grade for delivery to Bethlehem, Steelton and Coatesville, Pa. Other grades of scrap are weaker. No. 2 automobile steel has been bought by a consumer at Pencoyd, Pa., at $13.75 a ton, delivered, and specification pipe is off 50c. a ton, following purchase of a small tonnage at $14, delivered by a Lebanon, Pa., user. A report that a Claymont, Del., mill bought a small tonnage of No. 1 steel is attributed to the fact that this consumer recently accepted shipments of steel by brokers with the price to be agreed upon when the mill was ready to buy. Settlement is understood to have been made for the total tonnage, which was small, at $15.50 a ton, delivered.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel	$15.00 to $15.50
Scrap T rails	14.50 to 15.00
No. 2 heavy melting steel	12.50 to 13.75
No. 1 railroad wrought	16.00 to 16.50
Bundled sheets (for steel works)	11.50
Hydraulic compressed, new	14.50 to 15.00
Hydraulic compressed, old	12.00 to 12.50
Machine shop turnings (for steel works)	11.50
Heavy axle turnings (or equiv.)	14.00 to 14.50
Cast borings (for steel works and roll. mill)	11.00 to 11.50
Heavy breakable cast (for steel works)	14.50
Railroad grate bars	12.00 to 12.50
Stove plate (for steel works)	12.00
No. 1 low phos., hvy., 0.04% and under	21.00 to 22.00
Couplers and knuckles	19.50 to 20.50
Rolled steel wheels	19.50 to 20.50
No. 1 blast f'nace scrap	10.50 to 11.00
Wrot. iron and soft steel pipes and tubes (new specific.)	14.00
Shafting	19.00 to 19.50
Steel axles	22.50 to 23.00
No. 1 forge fire	13.50
Cast iron carwheels	15.50 to 16.00
No. 1 cast	16.00 to 16.50
Cast borings (for chem. plant)	14.50
Steel rails for rolling	16.50 to 17.00

National Steel Co. Is Incorporated

The National Steel Co., the organization recently formed by a merger of certain subsidiaries of the M. A. Hanna Co., Cleveland, and the Great Lakes Steel Corporation, Detroit, and the Weirton Steel Co., Weirton, W. Va., filed articles of incorporation in Delaware on Nov. 7.

The new company, which will have assets aggregating in excess of $150,000,000, will be effected through the exchange of securities. The stock tranfers are to be completed by Nov. 30. Properties involved in the merger will come under control of the new organization effective Dec. 1.

Lamson & Sessions Co. and Lake Erie Bolt Merge

Merger of the Lamson & Sessions Co. and the Lake Erie Bolt & Nut Co., Cleveland, has been approved by the directors of the two companies and shortly will be submitted to the stockholders for ratification. The combined business of the two companies is approximately $10,000,000 a year.

Under the terms of the merger the capital stock of the Lamson & Sessions Co. will be changed to no par value from $25 par and an increase authorized from 100,000 to 350,000 shares. There will be issued 172,500 shares to present shareholders of the Lamson & Sessions Co. in exchange for the present 100,000 shares and 70,000 shares to the stockholders of the Lake Erie company, one share to the latter for each share now held. In addition, Lamson & Sessions stockholders are to receive an extra cash dividend of $1 a share on present capital stock. On completion of the merger the Lamson & Sessions Co. will have 242,500 shares of no par common stock outstanding and $904,500 of 7 per cent preferred stock.

Westinghouse Radio Hour a Tribute to Steel

The steel industry was the subject of the first of a series of radio programs dedicated to the country's leading industries which are being broadcast by the Westinghouse Electric & Mfg. Co., East Pittsburgh, in an attempt to build up the good-will of the radio public for each particular industry. The series is being broadcast on Wednesday evenings at 7.30 over the country-wide network of the blue chain of the National Broadcasting Co., and other groups to be included are aviation, paper, food, textiles, pumping and irrigation and various phases of the electrical industry.

Detroit Scrap Prices Drop

DETROIT, Nov. 12.—Decided weakness in the market for old material has developed, declines in some instances running more than $1 a ton. There is very little buying, and some steel companies have suspended shipments.

Dealers' buying prices per gross ton, f.o.b. cars, Detroit:

Hvy. melting and shov. steel	$12.00 to $13.00
Borings and short turnings	8.00 to 8.50
Long turnings	7.75 to 8.25
No. 1 machinery cast	12.50 to 13.00
Automobile cast	11.50 to 12.00
Hydraul. comp. sheets	12.00 to 12.50
Stove plate	9.00 to 9.50
New No. 1 busheling	11.00 to 11.50
Old No. 1 busheling	9.50 to 10.00
Sheet clippings	8.00 to 8.50
Flashings	10.50 to 11.00

Pacific Coast

Standard Oil of California Seeks 300 Miles of Pipe—Southern Pacific Rail Inquiry for 120,000 Tons

SAN FRANCISCO, Nov. 9 (*By Air Mail*).—The recent stock market break apparently has had little effect on the iron and steel industry on the Pacific Coast, as bookings for the week compare favorably with the weekly average of the year and inquiries include some heavy tonnages. The Southern Pacific Co. is in the market for 120,000 tons of rails, together with a heavy tonnage of tie plates, track bolts and track spikes. The Standard Oil Co. is taking bids on upward of 300 miles of gas pipe, with an estimated weight of about 100,000 tons.

Building activity is well sustained, as shown by permits issued during the past month, and, from present indications, construction will continue unabated during the remainder of the year.

Pig Iron.—Demand for pig iron continues spotty, most consumers having fair-sized stocks. No change in quotations has occurred.

Prices per gross ton at San Francisco:

*Utah basic	$25.00 to $26.00
*Utah fdy., sil. 2.75 to 3.25	25.00 to 26.00
**Indian fdy., sil. 2.75 to 3.25	25.00 to 26.00

*Delivered San Francisco.
**Duty paid, f.o.b. cars San Francisco.

Bars.—Among the larger lettings of reinforcing steel bars was 363 tons for approaches for the West Spokane Street bridge, Seattle, placed with the Pacific Coast Steel Co., and 100 tons for an apartment house in Sacramento, Cal., booked by the Truscon Steel Co. Pending business calls for a fair-sized total and includes 800 tons for the Eleventh Street viaduct in Tacoma and 325 tons for a power house for the Lake Cushman dam project, Tacoma. Out-of-stock prices in San Francisco continue unchanged at 2.30c., base, on carload lots and at 2.60c. on smaller quantities. Merchant bar prices are firm at 2.35c., c.i.f., but demand is limited to small lots.

Plates.—Bookings of plate material this week were confined to lots of less than 100 tons. The Steel Tank & Pipe Co. was low bidder on 100 tons of 24-in. welded steel pipe for the East Bay Municipal Utility District, Oakland. Bids were opened on 370 tons of 52-in. pipe for the Cedar River pipe line No. 2 at Seattle. While 2.35c., c.i.f., is the general quotation, this price has been shaded, at least in one instance, by $4 a ton, and desirable tonnages can be placed at 2.25c.

Shapes. — Structural steel shape bookings exceeded 2100 tons and included 800 tons for a power house for the Pacific Gas & Electric Co., San Francisco, placed with the Judson-Pacific Co.; 525 tons for a soundproof stage for the RKO studios, Los Angeles, booked by the Consolidated Steel Corporation, and 300 tons for a mill for the Hines Lumber Co., Burns, Ore., secured by the Minneapolis Steel & Machinery Co. Lindstrom & Feigenson, Portland, got the general contract for the 2400-ton Eleventh Street viaduct at Tacoma, but have not yet awarded the sub-contract for the structural steel. Other pending business includes 830 tons for an office building in Phoenix and 600 tons for the Bremerton bridge, Seattle. Prices on domestic material continue firm at 2.35c., c.i.f.

Cast Iron Pipe.—Awards and new inquiries were not of heavy proportions this week. The National Cast Iron Pipe Co. took 297 tons of 10-in. Class B pipe for El Segundo, Cal., and the American Cast Iron Pipe Co. booked 200 tons of 6 and 8-in. Class 150 pipe for Burbank, Cal. Santa Ana, Cal., placed 449 tons of 2 to 8-in. Class B pipe with the Western Construction Co. The University of California, Berkeley, has abandoned the project at Redwood City on which it recently requested bids for 287 tons of 4 to 10-in. Class 150 pipe. The Los Angeles County Water Works District No. 16 will open bids Nov. 25 on 477 tons of 4 to 10-in. Class B pipe. San Diego, Cal., will open bids Nov. 14 on 293 tons for the improvement of La Mesa Colony and on Nov. 25 on 230 tons of 4 and 6-in. Class C pipe for Coronado Avenue.

Steel Pipe.—The Standard Oil Co. has an inquiry out for 44 miles of 18-in., 46 miles of 20-in., 82 miles of 22-in., 100 miles of 24-in. and 72 miles of 26-in. gas line pipe. Bids are being asked on several weights of pipe totaling approximately 100,000 tons. Foreign interests have been asked to quote on the pipe, but English and Continental mills are not able to make deliveries in the time specified.

Warehouse Prices, f.o.b. San Francisco

	Base per Lb.
Plates and struc. shapes	3.30c.
Soft steel bars	3.30c.
Small angles, ¾-in. and over	3.15c.
Small angles, under ¾-in.	3.55c.
Small channels and tees, ¾-in. to 2¾-in.	3.75c.
Spring steel, ¼-in. and thicker	5.00c.
Black sheets (No. 24)	4.90c.
Blue ann'l'd sheets (No. 10)	3.80c.
Galv. sheets (No. 24)	5.30c.
Struct. rivets, ½-in. and larger	5.65c.
Com. wire nails, base per keg	$3.40
Cement c't'd nails, 100 lb. keg	3.40

Boston

Export Demand for Scrap Grows as Call From Domestic Mills Declines—Pig Iron Dull

BOSTON, Nov. 12.—Current demand for pig iron is largely for car lots and for mixture purposes. The Mystic Iron Works reported the past week sales as 3000 tons, but other sellers did much less. While Buffalo district furnaces openly quote $18 a ton, furnace, for No. 2 plain and No. 2X, concessions of 50c. a ton are sometimes given. Foundries intimate they will buy first quarter iron next month, but there is no certainty on that point as many are covered into January.

Foundry iron prices per gross ton deliv'd to most New England points:

†Buffalo, sil. 1.75 to 2.25	$21.55 to $22.05
†Buffalo, sil. 2.25 to 2.75	22.05 to 22.55
*Buffalo, sil. 1.75 to 2.25	22.41 to 22.91
*Buffalo, sil. 2.25 to 2.75	22.91 to 23.41
East. Penn., sil. 1.75 to 2.25	22.65 to 23.15
East. Penn., sil. 2.25 to 2.75	23.15 to 23.65
Va., sil. 1.75 to 2.25	25.21
Va., sil. 2.25 to 2.75	25.71
*Ala., sil. 1.75 to 2.25	24.11
*Ala., sil. 2.25 to 2.75	24.61
†Ala., sil. 1.75 to 2.25	20.25
†Ala., sil. 2.25 to 2.75	20.75

Freight rates: $4.91 all rail from Buffalo, and $4.05 rail and water; $3.65 all rail from eastern Pennsylvania; $5.21 all rail from Virginia; $9.61 all rail from Alabama and $5.75 rail and water from Alabama to New England seaboard.

*All rail rate.

†Rail and water rate.

Reinforcing Steel.—Billet steel bar business is confined mostly to small lots, and the past week's aggregate was below average. Numerous prospects for round tonnages have either been abandoned or have shrunk to small proportions. Competition for business is keen, and quoted prices are often shaded. Prices quoted openly are 2.61½c. a lb., base, from stock on large tonnages and 3.16c. for small lots. The rail steel bar price is 2.26½c. a lb., base, delivered common Boston freight rate points, but concessions can be obtained.

Fabricated Steel.—No large ton-

Warehouse Prices, f.o.b. Boston

	Base per Lb.
Plates	3.365c.

Cold-punched nuts	50 and 5
Stove bolts	70 and 10

*Including quantity differentials.

nages were taken by fabricators the past week. Although pending jobs are relatively small, the aggregate is larger than a year ago. Competition among fabricators is still keen and some low prices are being made.

Cast Iron Pipe.—Chelsea, Mass., will close bids Nov. 14 on 100 tons of 6 and 8 in. pipe, and Keene, N. H., early next year will buy 3600 ft. of 12 in. No other open business developed the past week, but a fair tonnage was bought privately. Use of welded pipe by gas companies is materially cutting into New England sales of cast iron pipe. Prices quoted openly on domestic pipe are: 4-in., $44.10 to $45.10 a ton, delivered common Boston freight rate points; 6 to 12-in., $40.10 to $41.10; 16 to 20-in., $39.60. A $4 differential is asked on Class A and gas pipe.

Coke.—Virtually every New England foundry that makes a practice of contracting ahead for its fuel supply has done so for the first half of 1930 on a sliding price scale. According to coke makers, there is no indication that the present delivered price, $11 a ton, within a $3.10 freight rate zone, is likely to be changed soon. Current specifications against contracts hold about on a level with those for October.

Old Material.—The scrap market, so far as domestic consumption is concerned, is in the doldrums. Steel mills apparently want little scrap. Dealers' yard stocks are comparatively small, while scrap owners are reluctant to sell at prevailing prices. Values continue to seek new low levels, materials usually active being 25c. to 50c. a ton lower than a week ago. Quotations on girder rails, railroad and yard wrought, car axles and shafting are nominal. While domestic demand for scrap is lacking, that for foreign shipment is increasing. The 3000 tons of scrap reported as being loaded here for Danzig will go to Genoa instead. The freight is $6 a ton. Another boat will shortly load 3000 tons of rails and miscellaneous scrap for Danzig, with a $5.25 a ton freight rate. Negotiations are going on for other foreign shipments, aggregating about 10,000 tons.

Buying prices per gross ton, f.o.b. Boston rate shipping points:

No. 1 heavy melting steel	$10.00 to $10.25
Scrap T rails	10.00 to 10.25
Scrap girder rails	9.00 to 9.50
No. 1 railroad wrought	10.00 to 10.50
No. 1 yard wrought	9.50 to 10.00
Machine shop turnings	6.00 to 6.50
Cast iron borings (steel works and rolling mill)	6.00 to 6.50
Bundled skeleton, long	8.75 to 9.00
Forge flashings	9.00 to 9.50
Blast furnace borings and turnings	6.00 to 6.25
Forge scrap	8.50 to 9.00
Shafting	14.00 to 14.25
Steel car axles	17.00 to 17.50
Wrought pipe 1 in. in diameter (over 2 ft. long)	9.00 to 9.50
Rails for rolling	11.50 to 12.00
Cast iron borings, chemical	9.50 to 9.75

Prices per gross ton deliv'd consumers' yards:

Textile cast	$14.00 to $14.50
No. 1 machinery cast	15.00 to 15.25
No. 2 machinery cast	13.00 to 13.25
Stove plate	11.00 to 11.50
Railroad malleable	18.50 to 19.00

Youngstown

Valley Open-Hearth Operations Down to 60 Per Cent But Finishing Mills Are Doing Slightly More

YOUNGSTOWN, Nov. 12.—Steel operations in the Valleys are considerably lower than they have been this year, but further curtailment, at least in the rate of open-hearth operations, now seems unlikely. Only a few more than half of the total available open-hearth furnaces in the district are operating, although production is not less than 60 per cent of capacity. Finishing mills are running at a slightly higher rate, as the output of raw steel was not reduced as rapidly as rolling mill operations during October, and at this time steel companies are anxious to reduce their stocks of steel to the absolute minimum.

Last week pipe mills were running at a slightly better rate than sheet and strip units, a rather unusual occurrence in this district. Bar mill operations were also low, averaging between 50 and 60 per cent. However, the rate for bar mills is no longer fixed at the beginning of the week, and a plant which began the week at 50 per cent might end up at close to 70. The same thing is true with strip mills, although some strip units, as well as sheet mills, are being closed down occasionally for an entire week. In this manner a more economic operation is assured for the active weeks. Makers of automobile body and other special sheets are particularly hard hit, although the output of metal furniture sheets is still comparatively high.

Valley sheet mills are receiving slightly improved specifications from the Chevrolet Motor Co. for shipment during the last week of the month, but more conservative opinion does not interpret this as an indication of greater activity in the automobile industry during the remainder of this year. Further curtailment in the requirements of the Ford Motor Co. is expected, and other large users of steel in Michigan are tending to curtail rather than step up their production schedules during this month and December. The automobile industry has been the first to suffer definite adverse effects from the recent sharp decline in stock prices, but there is yet nothing to indicate that this will seriously interfere with production during the first half of 1930. Large users of steel in the immediate Youngstown district have also curtailed production slightly, but these companies are admirably located to maintain low stocks of steel, and have always taken advantage of their position in order to reduce inventories. Consequently Youngstown and nearby companies feel that they can count on a fairly good demand from this source over the remainder of the year.

Prices are fairly satisfactory for a period of such light demand. Although sheet quotations are $2 or more below those of the second quarter, they seem to be holding better at present levels than at any time during the last three months. Black sheets may be considered firm at 2.75c., Pittsburgh, and galvanized material is still generally quoted at 3.50c. However, jobbers are able to purchase material at $2 under this figure. Blue annealed sheets and light plates are still quoted at 2.35c. and 2.20c., Pittsburgh, respectively, and on the small tonnages, which constitute the bulk of business being placed at this time, these figures are holding fairly well. Wide strip competition occasionally develops sharp concessions, but sellers of the jobbing mill product are not inclined to meet such prices. Automobile body sheets are holding at 4c., Pittsburgh, and metal furniture at 4.10c. Reports that the auto body sheet price is meeting with considerable pressure in the Michigan territory are scouted in this district, as sellers say that no tonnages are coming out which could be considered attractive enough to invite price shading. Bars and plates are holding at 1.90c., Pittsburgh, and wire and wire nail prices are not as weak as they have been.

Pig iron demand is very light. Shipments have declined and curtailment in operations is expected to follow. The Youngstown Sheet & Tube Co. soon expects to blow out one of its Hubbard, Ohio, furnaces, which is generally considered a merchant stack, and another Valley producer may soon take similar action. The Carnegie Steel Co. has recently reduced its furnace operations rather sharply in the Valleys, and is now operating only three of its six stacks at Youngstown, one of three at New Castle and one of three at Farrell. The Republic Iron & Steel Co. is operating all four of its Haselton furnaces, while the Sheet & Tube company has four on at the Campbell works, and one at Brier Hill.

The scrap market is weak, and dealers would sell No. 1 heavy melting steel at $17. Hydraulic compressed sheets might bring almost as much, as the supply is limited, but there is little on which to base quotations in the absence of mill buying.

General Refractories Co., Philadelphia, has appointed as high-temperature cement representative in the Pittsburgh district the Harris Pump & Supply Co., 321 First Avenue, Pittsburgh. The territory will cover the western half of Pennsylvania, northern part of West Virginia, the eastern edge of Ohio and the extreme western end of Maryland. The commodities to be handled are Grefco, chrome high-temperature cement and standard silica bonding cement.

Cincinnati

Pig Iron Sales, at 3900 Tons, Largest in Four Weeks—Sheet Demand Declines

CINCINNATI, Nov. 12. — Although the district pig iron market is quiet and buyers are adhering to a conservative purchasing policy, the total sales last week were approximately 3900 tons, the largest amount sold in this district for about four weeks. Despite this apparent good tonnage, the break in stock market prices and the slackening of automotive production are having a depressing effect on the local market. Among the orders last week was one from a southern Ohio consumer for 200 tons of Southern foundry iron. This is the first fair-sized order since the return of Southern furnaces to formal price schedules, and the furnace representative indicates that this tonnage was taken at $14.50, base Birmingham. Southern furnaces are said to be adhering to this quotation. There is talk among furnace representatives here of a movement to increase the Southern price schedules. Other sizable orders were 300 tons of Northern iron from a Chattanooga, Tenn., buyer; 600 tons of Northern foundry from a Zanesville, Ohio, consumer and 250 tons of the same grade from a Kokomo, Ind., buyer. The rest of the week's business was in small quantities. Except for an inquiry from a Hamilton, Ohio, consumer for 1250 tons of Northern foundry iron, there is no pending business.

Prices per gross ton, deliv'd Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25	$19.89 to $20.39
Ala. fdy., sil. 1.75 to 2.25	17.69 to 18.19
Ala. fdy., sil. 2.25 to 2.75	18.19 to 18.69
Tenn. fdy., sil. 1.75 to 2.25	17.69 to 18.19
S'th'n Ohio silvery, 8 per cent	26.89

Freight rates, $1.89 from Ironton and Jackson, Ohio; $3.69 from Birmingham.

Finished Material.—The recent stock market break has brought an attitude of caution among district consumers of sheets. District mills report that specifications are lighter than a week or two ago. A leading interest in this district indicates that bookings last week were only slightly more than 50 per cent of capacity. Not only is this true of the automotive demand, but the general sheet demand also shows easing. Although a number of large construction projects are under way or contemplated, no movement has been made to cover for fabricated materials. The district fabricated steel market is dull.

Coke.—The movement of coke on contract has slackened noticeably this month. By-product oven representatives report that during the last week automotive foundries refused most of their shipments and, while other foundries took some coke, their specifications were not so large as usual. Beehive oven representatives, on the other hand, report that shipments are going forward at a fair rate. New business is virtually negligible.

Old Material.—Although mills in the South are taking scrap on contract and even in some instances making new purchases, local mills and those in the Valley are curtailing both shipments and purchases. The local old material market is feeling the pinch of the lessened demand and dealers are bidding 25 to 50c. less on the leading grades of scrap than they were a week ago. Dealers are exercising caution in their purchases. The Louisville & Nashville Railroad is offering a list of 7500 tons, of which 1600 tons is rails. The Southern Railway and the Chesapeake & Ohio are offering their usual lists.

Dealers' buying prices per gross ton, f.o.b. cars, Cincinnati:

Heavy melting steel	$12.75 to $13.25
Scrap rails for melting	14.00 to 14.25
Loose sheet clippings	8.50 to 9.00
Bundled sheets	10.75 to 11.25
Cast iron borings	8.50 to 9.00
Machine shop turnings	8.00 to 8.50
No. 1 busheling	10.25 to 10.75
No. 2 busheling	7.00 to 7.50
Rails for rolling	14.25 to 14.75
No. 1 locomotive tires	14.25 to 14.75
No. 2 railroad wrought	12.75 to 13.25
Short rails	18.00 to 18.50
Cast iron carwheels	12.50 to 13.00
No. 1 machinery cast	18.50 to 19.00
No. 1 railroad cast	15.00 to 15.50
Burnt cast	10.00 to 10.50
Stove plate	10.00 to 10.50
Brake shoes	10.00 to 10.50
Agricultural malleable	14.00 to 14.50
Railroad malleable	15.00 to 15.50

Warehouse Prices, f.o.b. Cincinnati

	Base per Lb.
Plates and struc. shapes	3.40c.
Bars, soft steel or iron	3.30c.
New billet reinforc. bars	3.15c.
Rail steel reinforc. bars	3.00c.
Hoops	4.05c.
Bands	3.50c.
Cold-fin. rounds and hex.	3.85c.
Squares	4.35c.
Black sheets (No. 24)	4.05c.
Galvanized sheets (No. 24)	4.90c.
Blue ann'l'd sheets (No. 10)	3.45c.
Structural rivets	3.85c.
Small rivets	65 per cent off list
No. 9 ann'l'd wire, per 100 lb.	$3.00
Com. wire nails, base per keg	2.85
Cement c't'd nails, base 100 lb. keg	2.85
Chain, per 100 lb.	8.75
	Net per 100 Ft.
Lap-weld steel boiler tubes, 2-in.	$16.50
4-in.	34.50
Seamless steel boiler tubes, 2-in.	17.50
4-in.	36.00

Birmingham

Pig Iron Shipments Large but New Business Is Light—Steel Orders Decline Slightly

BIRMINGHAM, Nov. 12. — A good movement of iron on contract is the chief activity in the pig iron market. A continuation of this active rate of shipments is expected for the remainder of November, at least. There has been only a small amount of forward coverage in the past few weeks. Inquiry for first quarter iron that began to develop in late October has subsided, and buyers appear satisfied to await developments. It is now predicted that the present quietness will delay the opening of books for the first quarter longer than had been expected. Prices show no change, the base being $14.50 for district sales. The number of active furnaces remains at 15.

Prices per gross ton, f.o.b. Birmingham dist. furnaces:

No. 2 fdy., 1.75 to 2.25 sil.	$14.50
No. 1 fdy., 2.25 to 2.75 sil.	15.00
Basic	14.50

Finished Steel. — Last week was quieter than any of the three weeks preceding. There was a drop in the number of large orders and a small decrease in specifications. There has been very little change in the volume of inquiries. Prices are unchanged. The Tennessee company has booked upward of 10,000 tons of rails for the Missouri Pacific Railroad. The Bessemer plant of the Pullman Car & Mfg. Co. is bidding on the large car inquiry of the St. Louis - San Francisco Railroad Co. Structural steel fabricators have booked several small orders. The tendency in the reinforcing bar market is toward slowness in placing contracts. The Tennessee company is operating seven open-hearths at Ensley and six at Fairfield, a decrease of two for the latter works. The Gulf States Steel Co. continues to work all six at Alabama City.

Cast Iron Pipe.—The National Cast Iron Pipe Co. has booked 2000 tons of 30 to 36-in. pipe for Kansas City, Mo. The project at Murfreesboro, Tenn., requiring three miles of 8 to 12-in. pipe was let to the American Cast Iron Pipe Co. The 4000-ton project at Dallas, Tex., is expected to be awarded this week. Several smaller projects have also been awarded, making the total bookings last week the highest for any week since September. With the development of "feelers" from public utilities on their requirements for next year, the market has a better outlook. Pressure pipe makers are keeping stocks light. Prices continue at $37 to $38, base.

Old Material.—Steel grades have rallied somewhat, following the slump about 10 days ago and they are now moving in fairly good volume. Iron scrap remains inactive. Steel axles are now quoted at $22, an increase of $1. All other prices are unchanged.

Prices per gross ton, deliv'd Birmingham dist. consumers' yards:

Heavy melting steel	$13.00 to $13.50
Scrap steel rails	14.00
Short shoveling turnings	9.00
Cast iron borings	9.00
Stove plate	11.50 to 12.00
Steel axles	22.00
Iron axles	23.00
No. 1 railroad wrought	10.00 to 10.50
Rails for rolling	15.50
No. 1 cast	13.00
Tramcar wheels	12.50
Cast iron carwheels	13.00 to 13.50
Cast iron borings, chem.	13.50 to 14.00

Buffalo

Pig Iron Shipments Hold Up but New Business Is Slack —Steel Mill Operations Reduced

BUFFALO, Nov. 12.—Shipments of pig iron are holding up well, but new business is slack. Current buying is in small lots for prompt shipment. The price of $19.50, base, is firm in the district, but the Eastern price of $18 is being shaded to $17.50. Barge canal shipments of pig iron will cease between Nov. 15 and 20. The "X" furnace of the Wickwire-Spencer Steel Corporation will go out within a short time and will be replaced by a "Y" furnace, which will resume operation on foundry iron.

Prices per gross ton, f.o.b. furnace:

No. 2 fdy., sil. 1.75 to 2.25	$19.50
No. 2X fdy., sil. 2.25 to 2.75	20.00
No. 1 fdy., sil. 2.75 to 3.25	21.00
Malleable, sil. up to 2.25	20.00
Basic	$17.50 to 18.00
Lake Superior charcoal	27.28

Finished Steel.—Mill operation is slightly lower than a week ago. The Lackawanna plant of the Bethlehem Steel Co. is now operating 18 open-hearths, the lowest number in some time; the Donner Steel Co. is operating four open-hearths, and the Wickwire-Spencer Steel Corporation is operating three out of its four. The Seneca Iron & Steel Co. is operating at 65 to 70 per cent. The structural steel market is quiet, with one inquiry out from Albany for 800 tons. The small structural tonnage has dropped off, though most fabricators report business booked sufficient to run shops for two months.

Old Material.—The latest purchase of No. 1 heavy melting steel was made about a week ago at $15. The tonnage is understood to have been comparatively small, but a considerable amount of No. 2 heavy melting steel was taken by the same consumer at $13.50. There has been a small sale of rolled steel wheels and railroad knuckles and couplers at about $18. Cast iron borings have become scarce. Production of turnings and borings is off, and there is a fair demand for turnings. General production of scrap has dropped off almost as much as shipments. One large mill here continues to hold up shipments, although some relief is in prospect for the dealers. The market is no weaker. One mill in this territory has received so far this year 200,000 tons of railroad and structural scrap, hydraulic compressed and drop forge flashings by boat shipment from West.

Warehouse Prices, f.o.b. Buffalo

	Base per Lb.
Plates and struc. shapes	3.40c.
Soft steel bars	3.30c.
Reinforcing bars	2.95c.
Cold-fin. flats, sq. and hex.	4.45c.
Rounds	3.95c.
Cold-rolled strip steel	5.85c.
Black sheets (No. 24)	4.20c.
Galv. sheets (No. 24)	4.85c.
Blue ann'l'd sheets (No. 10)	3.50c.
Com. wire nails, base per keg	$3.60
Black wire, base per 100 lb.	3.75

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades:		
No. 1 heavy melting steel	$15.00 to	$16.00
No. 2 heavy melting steel	13.50 to	14.50
Scrap rails	15.00 to	15.50
Hydraul. comp. sheets	13.50 to	14.50
Hand bundled sheets	11.00 to	11.50
Drop forge flashings	13.75 to	14.00
No. 1 busheling	13.50 to	14.50
Hvy. steel axle turnings	13.50 to	14.00
Machine shop turnings	7.50 to	8.00
No. 1 railroad wrought	13.00 to	13.50
Acid Open-Hearth Grades:		
Knuckles and couplers	17.00 to	17.50
Coil and leaf springs	17.00 to	17.50
Rolled steel wheels	17.00 to	17.50
Low phos. billet and bloom ends	18.00 to	18.50
Electric Furnace Grades:		
Short shov. steel turnings	11.25 to	11.75
Blast Furnace Grades:		
Short mixed borings and turnings	11.25 to	11.75

Steel rails, 3 ft. and under	18.75 to	19.00
Cast iron carwheels	13.00 to	13.50
Malleable Grades:		
Industrial	17.50 to	18.00
Railroad	17.50 to	18.00
Agricultural	17.50 to	18.00
Special Grades:		
Chemical borings	12.50 to	13.50

Canada

Pig Iron Demand Eases; Structural Steel Quieter

TORONTO, ONT., Nov. 12.—The demand for merchant pig iron in the Canadian markets continues to ease off. Spot buying in small tonnages is responsible for practically the entire business done during the week, with sales totaling about 1500 tons. No forward delivery orders were taken, but producers are heavily booked to the end of the year and are making regular and large tonnage shipments against contract. The daily melt has been slightly reduced as a result of curtailed operations among some of the automotive plants, but, taken as a whole, mills, foundries, radiator plants, etc., are running only slightly under the capacity mark. Backlogs are sufficient to maintain the present rate of operations for some time to come. It is reported that agricultural implement plants are now running under 50 per cent capacity. While the slowing down in this industry has some reaction on the Canadian iron and steel industry, its chief effect is on the importation of pig iron and other raw materials. Pig iron imports have been materially reduced during the past month or six weeks. The recent reduction in Canadian iron prices has brought the local quotations under the price quoted by United States furnaces for delivery in this market, with the result that there is little merchant iron coming into Canada other than that for use in the agricultural implement industry. Canadian iron prices are firm.

Prices per gross ton:

Delivered Toronto	
No. 1 fdy., sil. 2.25 to 2.75	$23.60
No. 2 fdy., sil. 1.75 to 2.25	23.10
Malleable	23.60
Delivered Montreal	
No. 1 fdy., sil. 2.25 to 2.75	$25.00
No. 2 fdy., sil. 1.75 to 2.25	24.50
Malleable	25.00
Basic	23.50
Imported Iron, Montreal Warehouse	
Summerlee	$33.50
Carron	33.00

Structural Steel. — With winter weather only a short way off, building activities in Canada are gradually declining, and a slowing down in structural steel demand has resulted. Only small tonnages were awarded during the week. Fabricators, however, are well supplied with orders and are assured of capacity operations well into the new year. Deliveries against contract are going forward on schedule.

Old Material—Little or no interest developed in the Canadian markets during the week. Buying by both Ontario and Quebec consumers appears to be held to a minimum, with the result that only small tonnages were closed. Consumption, however, is well sustained. Prices are unchanged.

Dealers' buying prices:

	Per Gross Ton	
	Toronto	Montreal
Heavy melting steel	$10.00	$8.50
Rails, scrap	11.00	9.00
No. 1 wrought	10.00	12.00

Malleable scrap	14.00	....

Change Reinforcing Steel Trade Practice

WASHINGTON, Nov. 11.—The Federal Trade Commission has reconsidered and modified Rule 8, adopted by the reinforcing steel fabricating and distributing industry in its recent trade practice conference. The rule, which came under Group II, was changed to read as follows:

> The industry approves the practice of each individual member of the industry independently publishing and circulating to the purchasing trade his own price lists.

The rule formerly provided for circulating an individual member's current price lists and also notices of advances, declines or other changes in prices. Group II rules are those which are accepted by the commission as expressions of the trade, and which may or may not concern practices in violation of the law.

St. Louis

Pig Iron Sales, 23,000 Tons, Include 10,000 Tons of Basic —Two Roads Buy 31,000 Tons of Rails

ST. LOUIS, Nov. 12.—The principal transaction in a week which showed a marked improvement over the preceding period was the sale of 10,000 tons of basic pig iron by the St. Louis Gas & Coke Corporation to an East Side melter for shipment during the remainder of 1929 and the first quarter of next year. The local maker, whose total sales for the week exceeded 23,000 tons, also sold 2000 tons of foundry iron to an Illinois implement manufacturer for shipment during the remainder of the year, 500 tons to an Illinois car builder for prompt shipment, and 200 tons and 300 tons respectively to jobbing foundries in St. Louis for first quarter shipment, the remainder being for prompt delivery. The melt in the St. Louis district is reported to be holding up well. Foundries catering to the automobile trade show a decrease in business, while the stove plants are exceedingly busy.

Prices per gross ton at St. Louis:

No. 2 fdy., sil. 1.75 to 2.25, f.o.b. Granite City, Ill.	$19.50 to $20.00
Malleable, f.o.b. Granite City	20.00
N'th'n No. 2 fdy., deliv'd St. Louis	22.16
Southern No. 2 fdy., deliv'd	16.92 to 18.92
Northern malleable, deliv'd	22.16
Northern basic, deliv'd	22.16

Freight rates: 75c. (average) Granite City to St. Louis; $2.16 from Chicago; $4.42 from Birmingham.

Rails.—The Wabash Railway purchased 23,000 tons of 110-lb. rails for January, February and March delivery, allocated as follows: Illinois Steel Co., 11,000 tons; Inland Steel Co., 9000 tons and Bethlehem Steel Co., 3000 tons. The Kansas City Southern Railway has purchased 8000 tons of rails from the Illinois Steel Co., Bethlehem Steel Co. and Inland Steel Co., the exact division not being known here.

Finished Steel.—Warehouse business for October is said to have been about 5 per cent better than that of the same month last year and slightly better than that of September. The increase has been on virtually all lines except structural. Structural fabricators are looking elsewhere for business, now that there is very little doing in St. Louis. The Mississippi Valley Structural Steel Co. got the order for 3500 tons for the Biltmore Hotel in Oklahoma City, Okla. The Missouri Highway Commission has opened bids for road and bridge work calling for 500 to 700 tons of reinforcing bars and 400 tons of structural steel.

Coke.—By-product ovens in the district report heavy shipments of domestic grades, and one factor reports stocks are lower than at any time in its history. Foundry and furnace coke also are in good demand.

Old Material.—The market for old material continues weak, as a result of the continued lack of buying by mills in the district, although two mills have indicated they will take supplies at their own prices, which dealers say are far too low. Dealers are buying only against contracts. There is some "distressed" material. No. 2 heavy melting steel, miscellaneous standard-section rails are 25c. lower, while railroad springs, bundled sheets, No. 2 railroad wrought, steel car axles, short steel rails and railroad malleable are 50c. lower. Railroad lists: Wabash, 3335 tons; Texas & Pacific, 1500 tons; Chicago, Rock Island & Pacific, 200 carloads; Great Northern, 106 carloads; St. Louis-San Francisco, 60 carloads, and Chicago & Eastern Illinois, 25 carloads.

Dealers' buying prices per gross ton, f.o.b. St. Louis district:

No. 1 heavy melting or shoveling steel	$13.00 to $13.50
No. 2 heavy melting or shoveling steel	12.25 to 12.75
No. 1 locomotive tires	15.00 to 15.50
Misc. stand.-sec. rails including frogs, switches and guards, cut apart	14.25 to 14.75
Railroad springs	16.00 to 16.50
Bundled sheets	9.50 to 10.00
No. 2 railroad wrought	13.00 to 13.50
No. 1 busheling	9.75 to 10.25
Cast iron borings and shoveling turnings	9.25 to 9.75
Iron rails	13.00 to 13.50
Rails for rolling	15.25 to 15.75
Machine shop turnings	7.25 to 7.75
Heavy turnings	9.50 to 10.00
Steel car axles	18.50 to 19.00
Iron car axles	27.00 to 27.50
Wrot. iron bars and trans.	21.50 to 22.00
No. 1 railroad wrought	13.00 to 13.50
Steel rails, less than 3 ft.	17.00 to 17.50
Steel angle bars	14.00 to 14.50
Cast iron carwheels	14.00 to 14.50
No. 1 machinery cast	15.25 to 15.75
Railroad malleable	14.00 to 14.50
No. 1 railroad cast	14.50 to 15.00
Stove plate	12.00 to 12.25
Agricult. malleable	14.00 to 14.50
Relay, rails 60 lb. and under	20.50 to 23.50
Relay, rails 70 lb. and over	26.50 to 29.00

Canadian Tariff Board Schedules Hearings

WASHINGTON, Nov. 12.—All items bearing upon the iron and steel industry of Canada, together with machinery and other lines, will be covered at hearings to be held at Ottawa by the Canadian Advisory Board on Tariff and Taxation, to begin Nov. 26, according to a telegram received by the Department of Commerce from Commercial Attache Lynn W. Meekins. Instructions to this end have been issued to the board by the Minister of Finance, who also asked that the hearings include a review of the various applications for duty changes on iron and steel products and machinery. The Minister of Finance likewise has requested the board to investigate relative prices of automobiles in Canada and in the United States, as well as the percentage of Canadian material and labor used in each model upon which Canadian manufacturers are now claiming exemption from excise tax. The final date of hearing has been set for Dec. 12, when motor vehicles will be the subject under discussion and when also the board will consider an application by a Canadian company for reduced duties on axles, bolts, shafts, radiators, and other parts for motor trucks.

The schedule of hearings follows:

Nov. 26.—Scrap, pig iron, ferroalloys, ingots, blooms, and billets, bars, and rods.

Nov. 27 and 28.—Sheets, plates, hoop, band, strip, skelp, structural steel, railroad track equipment.

Nov. 29.—Alloy provisions, special steel provisions, castings and forgings.

Dec. 3.—Pipes and tubes, chains, wire springs.

Dec. 4 and 5.—Machinery (agricultural, mining, printing and all other); engine and boilers, not including aeroplane engines.

Dec. 6.—Cutlery, hardware, tools, stamped and coated products, including enameled ware.

Dec. 10 and 11.—Railroad rolling stock, vehicles other than automobiles; stoves, and miscellaneous products.

Dec. 12.—Automobiles and motor trucks, including engines and parts.

Steel Corporation's Orders Gain 183,981 Tons

Another gain in the unfilled orders of the United States Steel Corporation was registered in October—183,981 tons. The gain in September was 244,370 tons. These two gains contrast with losses in the previous four months, the August decline having been 429,966 tons. The total on Oct. 31 was 4,086,562 tons as against 3,751,030 tons on Oct. 31, 1928.

Unfilled tonnage at the end of each month for the past three years follows:

	1929	1928	1927
October	4,086,562	3,751,030	3,341,000
September	3,902,581	3,698,368	3,148,113
August	3,658,211	3,624,043	3,196,037
July	4,088,177	3,570,927	3,142,014
June	4,256,910	3,637,000	3,053,246
May	4,304,167	3,416,822	3,050,941
April	4,427,763	3,872,133	3,456,132
March	4,410,718	4,335,206	3,553,140
February	4,144,341	4,398,189	3,597,119
January	4,109,487	4,275,947	3,800,177
	1928	1927	1926
December	3,976,712	3,972,874	3,960,696
November	3,673,000	3,454,441	3,807,447

Non-Ferrous Metal Markets

Lead and Zinc Again Decline —Tin at New Low—Copper Steady

NEW YORK, Nov. 12.

Copper. — Despite the sharp declines in prices of tin, lead and zinc, no marked weakness has yet appeared in copper. Within the week a few lots of so-called distress metal have been offered as low as 17.75c., delivered in the Connecticut Valley, but all producers, both primary and custom smelters, are rigidly adhering to 18c. and do not see any reason for a lower price for some time to come, if at all. Actual buying of copper is extremely light. Domestic consumers are taking only hand-to-mouth lots, although they admit that orders on their books for fabricated material are not all covered by copper contracts. Foreign consumers are also buying sparingly. There is some talk that the situation may reappear which prevailed during the summer when primary producers were entirely out of the market and left such business as there was to custom smelters. Copper exporters continue to hold their quotation to 18.30c., c.i.f. usual European ports, although in the last week electrolytic copper in London has sold at an equivalent of 18.15c. Production is being curtailed at the mines, one company announcing a reduction of 25 per cent in its output, with others reported to be planning reduction. October statistics out today were quite favorable to producers. Refined stocks were reduced 6350 tons, and total stocks about 5000 tons, which means an increase in blister copper stocks of about 1350 tons. Shipments in October were the second best total at 105,729 tons, compared with 105,860 tons in March. Foreign shipments in October were 53,000 tons against 59,000 tons also in March. Lake copper is very quiet and steady at 18.12½c., delivered.

Tin.—Spot Straits tin yesterday at 39c., New York, is the lowest price since Aug. 14, 1923. Lower prices have been the rule since last week, due largely to weakness in London. Sales have been larger, however, at these prices, the total for the week ended Saturday, Nov. 7, having been about 800 tons. Yesterday, 200 tons was sold, but the most active day was Thursday, Nov. 7, when 400 tons changed hands. This single day of activity was due largely to a stronger stock market and a heavy reduction in brokers' loans. In yesterday's

Rolled Products

List Prices, Per Lb., f.o.b. Mill

On Copper and Brass Products, Freight up to 75c. per 100 Lb. Allowed on Shipments of 500 Lb. or Over

Sheets—
- High brass ..... 23.25c.
- Copper, hot rolled ..... 26.75c.
- Zinc ..... 10.50c.
- Lead (full sheets) ..... 10.25c.

Seamless Tubes—
- High brass ..... 28.25c.
- Copper ..... 29.25c.

Rods—
- High brass ..... 21.25c.
- Naval brass ..... 24.00c.

Wire—
- Copper ..... 19.87½c.
- High brass ..... 23.75c.

Copper in Rolls ..... 26.75c.
Brazed Brass Tubing ..... 30.87½c.

Aluminum Products in Ton Lots

The carload freight rate is allowed to destinations east of Mississippi River and also to St. Louis on shipments to points west of that river.

Sheets, 0 to 10 gage, 3 to 30 in. wide ..... 33.00c.
Tubes, base ..... 42.00c.
Machine rods ..... 34.00c.

Zinc	3.25c.	3.75c.
Sheet aluminum	13.00c.	14.00c.
Cast aluminum	11.25c.	13.25c.

market, prices ranged from 39.25c. down to 38.87½c., for spot and November shipment, both positions selling at the same price. At the close of the day there were more buyers than sellers. Tin closed today at 39.37½c. in a very dull market. Consumers are not buying far ahead, but dealers are more active than for some time. London prices today were £174 15s. for spot standard, £178 for future standard and £178 15s. for spot Straits. The Singapore price today was £180 12s. 6d. A week ago the London prices were about £7 a ton higher.

Lead.—Another reduction by the American Smelting & Refining Co. on Nov. 7, the third in the last 10 days, has brought the New York contract price down from 6.50c. to 6.25c. Here also the decline is largely due to weakness in the London market. Buying is a little more active, but by no means heavy, and is confined to November and December shipment. Some inquiry has appeared for January, but producers are not quoting. At St. Louis, the price is down to 6.10c.

Zinc.—Still further declines in London have forced the quotation of prime Western zinc from 6.50c. to 6.25c., East St. Louis. A little business is reported each day, but buyers continue extremely cautious. Two reductions in the price of ore at Joplin, Mo., have been made in the last two weeks and the quotation now stands at $40, a decline of $4 a ton. The corresponding decline in the metal has been about 55 points. Production was fairly large at 13,000 tons for the week ended Saturday, Nov. 7, and the surplus is now estimated at 58,010 tons. Sharp curtailment is reported planned during the present month.

Antimony.—Prospects that the duty on antimony may be higher because of action this week by the Senate has caused some anxiety and prices are a little higher than they were during the week. Chinese metal for spot and early delivery is quoted at 8.62½c., duty paid. Should the Senate's view prevail, the duty would be 4c. instead of at 2c. as at present.

Nickel.—Wholesale lots of ingot nickel are quoted at 35c. per lb. with shot nickel at 36c. and electrolytic nickel in cathodes at 35c.

Aluminum.—Virgin metal, 98 to 99 per cent pure, is quoted at the published price of 23.90c. per lb., delivered.

Non-Ferrous Markets at Chicago

CHICAGO, Nov. 12.—Sales in this market are quiet as prices, except for copper, continue to sag. The old metal market is dull and prices are untested.

Prices per lb., in carload lots: Lake copper, 18.50c.; tin, 40.12½c.; lead, 6.20c.; zinc, 6.35c.; in less-than-carload lots, antimony, 9.35c. On old metals we quote copper wire, crucible shapes and copper clips, 14c.; copper bottoms, 11.50c.; red brass, 11.50c.; yellow brass, 8c.; lead pipe, 4.50c.; zinc, 3c.; pewter, No. 1, 24.50c.; tin foil, 24c.; block tin, 34c.; aluminum, 12.87½c.; all being dealers' prices for less-than-carload lots.

Railroad Equipment

Boston & Maine Orders 1500 Additional Cars

THE outstanding railroad equipment order of the week was placed by the Boston & Maine, calling for 1000 steel box cars and 500 steel hopper cars, which is a duplicate of an order placed by this road a few weeks ago. Both orders went to the Standard Steel Car Co. The Union Tank Car Co. has ordered 1000 tank cars.

Prospects for continued buying of cars is regarded by the car building trade as exceedingly bright. About 15,000 cars are pending, and action on these is expected before the end of the year. The Rock Island inquiry for 5000 and that of the St. Louis-San Francisco for 3800 may be decided within a week or two. Inquiries are also pending for more than 200 locomotives.

Inquiries that are expected before the end of the year make a total of about 20,000 cars. One large road is said to have planned a car-building program for the next three years that will call for the purchase of 10,000 steel box cars a year.

Car orders thus far in 1929 total about 85,000 units, in addition to which railroads have ordered 9000 cars to be built in their own shops. It is probable that car purchases for the year will run well over 100,000, which would be the largest total since 1924.

Boston & Maine on Tuesday announced the purchase of 1000 steel box cars and 500 steel hopper cars from Standard Steel Car Co., duplicating an order placed with the same car builder a few weeks ago.

Seaboard Air Line is now inquiring for a total of 20 locomotives.

Western Electric Co. is inquiring for 15 flat cars.

National Railways of Mexico have ordered 600 standard gage box cars, 200 gondola cars and 240 sets of trucks from Standard Steel Car Co.

New York, Chicago & St. Louis has ordered 10 steel underframes from Canton Car Co.

Chevrolet Motor Co. has ordered 20 hopper cars from Standard Steel Car Co.

Anglo-Mexican Petroleum Co., Ltd., has ordered six tank cars from General American Tank Car Corporation.

Montour Railroad is inquiring for two locomotives.

Georgia, Ashburn, Sylvester & Camilla is inquiring for one locomotive.

Milwaukee Road is considering coming into the market for 5000 cars.

Union Tank Car Co. has ordered 1000 tank cars from American Car & Foundry Co.

Reinforcing Steel

Awards, at 4000 Tons, Show Decline—Inquiries 4300 Tons

THE total of reinforcing steel awards, at slightly more than 4000 tons, was the smallest for any week since Oct. 17. The outstanding contracts were 1500 tons of bars for an industrial building and warehouse in New York and 350 tons for a building in Newark, N. J. New projects totaling about 4300 tons were larger than in the two previous weeks and included 1000 tons in a building for the Pennsylvania Terminal & Warehouse Co., Hoboken, N. J. Awards follow:

NEWBURY, MASS., 180 tons, bridge, to McClintic-Marshall Co.

NEW YORK, 1500 tons, industrial building and warehouse in Varick Street, to McClintic-Marshall Co.

NEWARK, N. J., 200 tons, plant building for National Biscuit Co., to Faitoute Iron & Steel Co.

NEWARK, 135 tons, vaults for National Newark & Essex Bank, to Faitoute Iron & Steel Co.

NEWARK, 350 tons, Monoservice Building, to Igoe Brothers.

SAYREVILLE, N. J., 100 tons, in addition to previous contract, power house, Eastern New Jersey Power & Light Co., to Concrete Steel Co.

CLEVELAND, 250 tons, Film Exchange Building for Warner Brothers Pictures, Inc., to Patterson-Leitch Co.

CINCINNATI, 195 tons, building for Hamilton County Tuberculosis Sanitarium, to West Virginia Rail Co.

CHICAGO, 150 tons, building for Norton Co., to Concrete Engineering Co.

CHICAGO, 350 tons, 124th Field Artillery Armory, to Olney J. Dean & Co.

SACRAMENTO, CAL., 100 tons, apartment building, Fourteenth and N Streets, to Truscon Steel Co.

SACRAMENTO, 147 tons, bridge over San Gabriel River, to unnamed bidder.

PORTLAND, ORE., 100 tons, warehouse on East Oak Street, to Mercer Steel Co.

SEATTLE, 363 tons, approach to West Spokane Street bridge, to Pacific Coast Steel Co.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

NEW HAVEN, CONN., 500 tons, sewage disposal plant.

NEW YORK, 200 tons, battery tower, West Washington Street.

HOBOKEN, N. J., 1000 tons, additional unit, Pennsylvania Terminal & Warehouse Co.

BROOKLYN, 200 tons, bridge for Brooklyn-Manhattan Transit Co.

PROVIDENCE, R. I., 150 tons, Crawford Street bridge.

MAYWOOD, ILL., 150 tons, high school.

SPRINGFIELD, ILL., tonnage being estimated, Centennial building.

WAUKEGAN, ILL., 230 tons, power house.

AURORA, ILL., 127 tons, building for Illinois Bell Telephone Co.; Goertz Construction Co., general contractor.

JEFFERSON CITY, MO., 500 to 700 tons, bridge and road work for Missouri Highway Commission.

TACOMA, WASH., 800 tons, Eleventh Street viaduct; general contract to Lindstrom & Feigenson, Portland, Ore., reinforcing steel subcontract not yet placed.

TACOMA, 325 tons, power house No. 2, Lake Cushman dam project; bids opened.

Fabricated Structural Steel

Awards of 26,000 Tons Exceed Previous Week But New Business Is Smallest Since June

AWARDS of the past week, totaling close to 26,000 tons, were slightly larger than in the previous week, but below the average for the year. Outstanding contracts were 5000 tons for an apartment building in New York, 3000 tons for a hotel in Oklahoma City, Okla., and 1800 tons for State buildings at Springfield, Ill.

The tonnage of new projects reported was the smallest since June 20, totaling about 19,000 tons. The largest project calls for 3500 tons for a power plant at Waukegan, Ill., and 2500 tons is required for a bank building in Philadelphia. Awards follow:

BOSTON, 370 tons, draw span Congress Street bridge, to Boston Bridge Works, Inc.

BOSTON, 200 tons, banking house addition, to Palmer Steel Co.

CAMBRIDGE, MASS., 200 tons, Vanderbilt Hall, Harvard College, to New England Structural Co.

NEW YORK, 2500 tons, apartment building at 895 Park Avenue, to Levering & Garrigues Co.

NEW YORK, 1800 tons, apartment building at Seventy-eighth Street and Third Avenue, to Harris Structural Steel Co.

NEW YORK, 650 tons, apartment building on East Twenty-first Street, to Paterson Bridge Co.

BROOKLYN, 800 tons, Nurses' Home for Methodist Hospital, to George A. Just Co.

NEW YORK, 5000 tons, San Remo Towers apartment building, Seventy-fourth Street and Central Park West, to Harris Structural Steel Co.

NEW YORK CENTRAL RAILROAD, 400 tons, to American Bridge Co.

SPRINGFIELD, ILL., 1800 tons, State buildings, to Mississippi Valley Structural Steel Co.

BALTIMORE & OHIO RAILROAD, 150 tons, to McClintic-Marshall Co.

KALAMAZOO, MICH., 550 tons, building for Checker Cab Co., to Indiana Bridge Co.

CLEVELAND, 300 tons, East Seventy-ninth Street bridge for Nickel Plate Railroad, to American Bridge Co.

AKRON, OHIO, 700 tons, building for Akron *Times-Press*, to American Bridge Co.

TOLEDO, OHIO, 500 tons, addition for Electric Auto-Lite Co., to Whitehead & Kales Co.

KOKOMO, IND., 410 tons, telephone exchange, to Insley Mfg. Co.

FORT WAYNE, IND., 400 tons, Publix Theater, to McClintic-Marshall Co.

STURGEON BAY, WIS., 1000 tons, highway bridge, to Wausau Iron Works.

CHICAGO, 150 tons, Frederick H. Hild Library, to Wendnagel & Co.

CHEYENNE, WYO., 1200 tons, highway bridge across Canadian River, to Lakeside Bridge & Steel Co., Milwaukee.

SAND SPRINGS, OKLA., 900 tons, highway bridge across Arkansas River, to Clinton Bridge Co.

OKLAHOMA CITY, 3000 tons, Biltmore Hotel; 2500 tons to Mississippi Valley Structural Steel Co. and 500 tons to Kansas City Structural Steel Co.

SAN FRANCISCO, 140 tons, hotel, Turk and Polk Streets, to Judson-Pacific Co.

SAN FRANCISCO, 800 tons, power house for Pacific Gas & Electric Co., to Judson-Pacific Co.

OAKLAND, CAL., 110 tons, addition to Pier No. 2, Oakland Port Commission, to Pacific Coast Engineering Co.

LOS ANGELES, 525 tons, sound stage for R. K. O. Studios, to Consolidated Steel Corporation.

BURNS, ORE., 300 tons, mill for Hines Lumber Co., to Minneapolis Steel & Machinery Co.

SEATTLE, 243 tons, approach to West Spokane Street bridge, to Pacific Car & Foundry Co.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

PHILADELPHIA, 2500 tons, Market Street Bank, Juniper & Market Streets; William Steel & Sons, general contractors.

PHILADELPHIA, 7000 tons, convention hall; McCloskey & Co., Philadelphia, low bidders on general contract.

STATE OF VERMONT, 900 tons, New England Power Co. units.

BOSTON & MAINE RAILROAD, 350 tons, signal bridges.

FAIRFIELD, CONN., 200 tons, State bridge.

WATERTOWN, MASS., 175 tons, Hood Rubber Co. vulcanizing plant.

BOSTON, 180 tons, Lafayette Theater.

PROVIDENCE, R. I., 160 tons, United States Rubber Co. vulcanizing plant.

BOSTON & ALBANY RAILROAD, 150 tons, power house in Allston district.

NEW YORK, 2000 tons, apartment building at Eighty-ninth Street and Park Avenue.

NEW YORK, 1500 tons, Union League Club building, Park Avenue.

PHILADELPHIA, 500 tons, Jewelers' Building; up again for bids.

BALTIMORE & OHIO RAILROAD, 500 tons, bridges.

ALBANY, N. Y., 800 tons, county jail; bids Nov. 25.

CLEVELAND, 110 tons, Dudley H. Blossom swimming pool.

WAUKEGAN, ILL., 3500 tons, power house for Public Service Co. of Northern Illinois; bids to be asked soon.

PROVISO, ILL., 535 tons, township high school; Union Foundry Co., Chicago, low bidder.

JEFFERSON CITY, MO., 400 tons, bridge and road work for Missouri Highway Commission.

WICHITA, KAN., 800 tons, highway bridge.

SUBIACO, ARK., 600 tons, church.

PHOENIX, ARIZ., 830 tons, office building on First Avenue; bids being taken.

RIVERSIDE, CAL., 1250 tons, highway bridge.

SACRAMENTO, CAL., 168 tons, bridge over Corte Madera Creek; bids Nov. 27.

OAKLAND, CAL., 100 tons plates, 24-in. welded steel pipe line, East Bay Municipal Utility District; Steel Tank & Pipe Co., low bidder.

SEATTLE, 600 tons, Bremerton, bridge; bids being taken.

SEATTLE, 370 tons, Dumas Bay bridge; bids Nov. 12.

TACOMA, WASH., 2400 tons, Eleventh Street viaduct; general contract to Lindstrom & Feigeson, Portland, subcontract for steel not yet placed.

Sees Curtailed Demand for Machine Tools

Commenting on the probable effect of the stock market crash on machine tool business, Ernest F. DuBrul, general manager, National Machine Tool Builders' Association, writing in that body's monthly review, says:

On the whole, the near term prospect is not particularly bright. We should always remember that we feel the effects of business movements much more violently both on the upswing and the downswing than the consumer goods industries. That is one of the risks of the machine tool business which must be assumed by anyone who has the ambition to engage in this industry. . . . With the falling off of demand will come some laying off of workmen, and that restricts further demand.

It would seem to be prudent for the machine tool builder to beware of increasing inventory. Inventory that is now on hand, whatever its extent, has been accumulated to fill unfilled orders that have been on the books for some months. But some cancellations have already developed from the over-enthusiastic aircraft industry and perhaps such cancellations might develop in other industries, due to lack of business confidence.

Philadelphia Steel Club Elects Officers

At a luncheon meeting on Nov. 12, the Steel Club of Philadelphia elected its officers for the coming year. Paul M. King, Worth Steel Co., who was vice-president, is the new president, succeeding Willard S. Haring, Alan Wood Steel Co. W. W. Deal, American Steel & Wire Co., was elected vice-president, and S. H. Baker, Sharon Steel Hoop Co., was reelected secretary. John E. Wetzel, Superior Steel Corporation, and Robert J. McCracken, Central Iron & Steel Co., were elected directors.

Higher Freight Rates from South Suspended

WASHINGTON, Nov. 12.—The Interstate Commerce Commission today announced suspension until June 12 of tariff schedules proposing to cancel existing commodity rates on iron and steel products in carloads from points in Alabama, Georgia, Tennessee and Mississippi to points in Trunk Line and New England territories and the substitution of eighth class rates.

Under the proposed schedules, the rate from Birmingham to New York would be increased from 49c. to 65c. per 100 lb. and the rate from Birmingham to Boston would be increased from 51c. to 69c. The suspended schedules will be the subject of a hearing to be held in Birmingham on Dec. 16 before Examiner McChord.

PERSONAL

FREDERICK M. BECKET, president, Union Carbide & Carbon Research Laboratories, was among the distinguished alumni receiving the honorary degree of Doctor of Science at the 175th anniversary of Columbia University. WILLIAM CAMPBELL, Howe Professor of Metallurgy at Columbia University, also was awarded the honorary degree of Doctor of Science.

—

WILLIAM HUTTON BLAUVELT, consulting engineer, New York, has been appointed manager of gas engineering of the Columbia Engineering & Management Corporation, a subsidiary of Columbia Gas & Electric Corporation, New York. CHARLES R. BELLAMY, who has been associated with Mr. Blauvelt in consulting practice, has joined the Columbia organization as gas engineer.

—

R. L. COLLIER has been made assistant to GRANVILLE P. ROGERS, managing director of the Steel Founders' Society of America. Mr. Collier is a graduate of Ohio State University. For some time he conducted special work for a public utility company at Cleveland, and for the past three years has been engaged in trade organization work in the electrical field. He will be located in the executive offices of the society, 932 Graybar Building, New York, these offices having been moved from Pittsburgh.

—

GLENN MUFFLY, engineer in charge of aircraft engine production for the Union Switch & Signal Co., Swissvale, Pa., during the war, has been added to the executive staff of American Cirrus Engines, Inc., Marysville, Mich., a unit of Allied Motor Industries, Inc.

—

JAMES BRYDEN, works manager of Smith & McLean, Ltd., sheet and bar makers and galvanizers, Glasgow, Scotland, sailed for England on the Mauretania, Nov. 6, after a stay of several weeks in this country.

—

J. P. GILL, metallurgist for the Vanadium-Alloys Steel Co., Latrobe, Pa., addressed the Hartford chapter of the American Society for Steel Treating on "Alloys and Their Effects in Tool Steels" in the Hartford Electric Co. assembly hall, Nov. 12.

—

JOSEPH P. FLETCHER, heretofore manager of the Buffalo office of the Independent Pneumatic Tool Co., Chicago, has been appointed manager of the Philadelphia office, succeeding A. L. Schuhl, deceased. W. O. BECKER, who has been in the Toronto office, has been named manager in Buffalo.

—

GORDON THORNTON has been added to the Clevland staff of the United States Electrical Tool Co., Cincinnati.

E. D. COWLIN, formerly New York manager of the Reliance Mfg. Co., manufacturer of spring washers and cold-drawn alloy steel, Massillon, Ohio, has been made general sales manager of the company and will make his headquarters at Massillon about Jan. 1.

—

ARTHUR C. ALLSHUL, formerly manager of the Buffalo plant of Joseph T. Ryerson & Son, Inc., has been appointed manager of its new unit in

A. C. ALLSHUL

the Philadelphia district. As previously announced, the Ryerson company has purchased the business, equipment and good will of the Penn-Jersey Steel Co., Camden, N. J. CLARENCE S. GEDNEY has been appointed manager of the Buffalo plant, succeeding Mr. Allshul. Mr. Gedney has been connected for many years with the specialty sales division of the Ryerson business in the Chicago territory.

—

H. BORNSTEIN, who is in charge of the testing and research laboratory of the Deere Co., Moline, Ill., spoke on "Problems in Cast Iron Metallurgy" at the monthly meeting of the Wisconsin Gray Iron Foundry Group, held at the Hotel Schroeder, Milwaukee, Nov. 6.

—

L. E. ROARK, secretary of the Peoria Manufacturers' and Merchants' Association, has been elected president of the Illinois Industrial Council. The council consists of secretaries of associations of industrial communities in Illinois. A program of accident prevention is planned, as well as one of university training by the University of Illinois of promising students in the industrial field.

—

NORMAN LEONHARD, superintendent of the pattern-making department of the Kissel Motor Car Co. for the last nine years, has resigned and has taken an interest in the Waukesha Pattern Works, Waukesha, Wis., established since 1926, but which has just been incorporated.

—

WILLIAM H. TEXTER, who has been in charge of market survey work for the National Association of Flat Rolled Steel Manufacturers, Cleveland, has been appointed assistant to R. J. KAYLOR, director of publicity for the Youngstown Sheet & Tube Co., Youngstown. Mr. Texter has been identified with the steel industry since 1913 in various capacities, and has been with the Flat Rolled Steel makers for a year and a half.

—

WILLIAM C. REITZ, HENRY J. MILLER, CHARLES E. BEESON and WILLIAM C. SUTHERLAND have been elected vice-presidents of the Pittsburgh Steel Co., Pittsburgh. Mr. Reitz continues as treasurer of the company and Mr. Miller as secretary. Mr. Beeson has charge of raw materials, and Mr. Sutherland, who was formerly assistant to the president, will remain in charge of the company's manufacturing activities. He was made a director of the company a short time ago. EMIL WINTER continues as first vice-president.

—

ROBERT M. KANIK has been named a director of the Appleton Steel Tube Co., Appleton, Wis. He is president and general manager of the Moloch Foundry & Machine Co., Kaukauna, Wis.

—

J. R. MORRIS, chief metallurgist of the Central Alloy Steel Co., Massillon, Ohio, was the speaker at the Nov. 5 meeting of the Tri-City chapter of the American Society for Steel Treating. He explained new developments in the process of nitriding steel.

—

F. J. HEPP, manufacturing engineer, Westinghouse Electric & Mfg. Co., East Pittsburgh, will speak at a meeting of the Pittsburgh Foundrymen's Association at the Fort Pitt Hotel, Pittsburgh, on Nov. 18. Mr. Hepp, who has spent approximately 55 years of his life in the foundry industry, will speak on "Memoirs of Patterns and Castings."

—

CHARLES O. HADLY, formerly vice-president in charge of sales of the Alan Wood Steel Co., Philadelphia, has joined the executive staff of the United States Steel Corporation at 71 Broadway, New York. For many years he has been prominent in the working out of distribution problems in the sheet steel industry.

A. M. Castle & Co. report net earnings of $666,402 for the nine months ended Sept. 30, after all charges and taxes, equal to $5.55 a share on the common stock. This compares with $489,470 net, or $4.15 a share, in the same period of 1928.

OBITUARY

CHARLES S. LE POER TRENCH, editor of the *American Metal Market* since 1899 and senior partner in C. S. Trench & Co., dealers in non-ferrous metals, New York, died in St. John's Hospital, Brooklyn, on Nov. 8, aged 75 years. He was born at Stadbroke, England, and came to the United States as a young man, identifying himself with White & Haskell, metal brokers, New York. In 1881, he organized C. S. Trench & Co. and was an outstanding figure in the metal trade during his entire business career. During the war, Mr. Trench was chairman of the British Red Cross and later was active in the British Great War Veterans of America. He was also president of the British Empire Chamber of Commerce in America.

C. S. LE POER TRENCH

—

JOSEPH W. DONNER, vice-president in charge of operations of the Donner Steel Co., Buffalo, died at his home in that city on Nov. 9, following a long illness, aged 35 years. He was born at Columbus, Ind., and was educated at private schools. After his graduation from Princeton University in 1917, he became identified with the Donner Steel Co., where he held various positions in the operating end of the business. He became general superintendent in January, 1926, and was made vice-president in May of this year.

—

HARRY C. HAIGHT, president, American Forge & Machine Co., Canton, Ohio, died on Nov. 4. He had been associated with the company since 1909.

—

W. E. GERLINGER, president of the Gerlinger Aluminum and Brass Foundry Co., Milwaukee, and founder in the same city of the Gerlinger Electric Steel Casting Co. in 1902, from which he later withdrew, died at his home in Milwaukee, Nov. 3, aged 55 years.

—

W. J. RATTLE, who established the first firm of analytical iron ore chemists in Cleveland, died Nov. 5, aged 77 years. He was graduated from Sheffield Scientific School of Yale University in 1874 and opened offices in Cleveland four years later. Before the war he was called to Russia by the Imperial Government to consult on the developments of the Russian iron ore industries and he was engaged at various times in other foreign countries as a consultant. He retired about a year ago because of poor health.

—

HENRY AYLETT COLES, Atlanta, Ga., district manager for the Westinghouse Electric & Mfg. Co., East Pittsburgh, died recently at New Orleans. He was born in Virginia in 1870 and attended Roanoke College and the University of Virginia. He joined the Westinghouse company more than 30 years ago, and has been stationed at Atlanta since 1897.

—

CLARENCE R. CRAIN, superintendent of the Mattison Machine Works, Rockford, Ill., and president of the Rockford branch of the American Society for Steel Treating, died Oct. 29, aged 38 years.

Smaller Coal Production In 1928

Total production of bituminous coal last year is reported by the United States Bureau of Mines at 500,745,000 net tons, which is a decline of 3.3 per cent from the 517,763,000 tons mined in 1927. Maximum output was made in October, with 51,176,000 tons, and minimum in April, with 32,710,000 tons. The average number of working days in the year was 307, giving an average output of 1,631,000 tons each working day.

Anthracite production in 1928 is reported at 75,348,000 tons, a decline of 5.9 per cent from the 80,096,000 tons of 1927. Maximum production for the year was in October, with 8,400,000 tons, while the smallest month's output was that of July, with 4,394,000 tons. Working days amounted to 303½ in the year.

Production of bituminous coal in the 1929 calendar year to Nov. 2 is reported by the United States Bureau of Mines at 436,568,000 net tons. This is 8.8 per cent more than the 406,707,000 tons up to the same date in 1928, but is about the same as the 1927 output at the corresponding date.

Automobile Sales Adversely Affected in Large Cities

Automobile sales in metropolitan sections have declined as a consequence of stock market slump, and some cancellations of orders and a definite loss of interest by prospects have been reported. Sections of the country not directly affected by security trading apparently have felt no reaction, however, unless possibly a favorable one, according to *Automotive Industries*.

Some timidity has been exhibited by certain manufacturers, who have abandoned production schedules for the rest of the year, but too much importance should not be attached to this condition in view of the fact that schedules for production in many of these plants are naturally very low at this time pending the introduction of new models.

It is difficult to accept the argument that automobile factories in the United States and Canada will be able to match the production of 512,450 units turned out during the last two months of 1928, particularly as operating schedules as announced by a number of factories indicate a considerable recession from the October program.

Large Order Placed for Steel Office Equipment

The General Fireproofing Co., Youngstown, has received a contract to supply complete steel office equipment for the new $8,000,000 office building which is being constructed at Hartford, Conn., by the Aetna Life Insurance Co.

W. H. Foster, chairman of the General Fireproofing Co.'s board of directors, says this is the largest single order of the kind ever placed. It includes hundreds of steel desks, filing equipment pieces, steel shelving, chairs, racks, cabinets and safes. It is to be completed by Jan. 1, 1931.

The fireproofing company is bringing to completion at Warren, Ohio, a new department to manufacture aluminum office chairs.

The Youngstown Pressed Steel Co. has started an addition to produce enameled ware, which will involve an expenditure of nearly $500,000.

New Electrolytic Zinc Plant Started at St. Louis

Announcement has been made by the Evans-Wallower Lead Co., of the successful operation of its electrolytic zinc plant at East St. Louis, Ill. The roasters were started early in September and power was switched on the cellroom on Sept. 23. Output of cathode zinc at the beginning was 25 tons per day and production has been increased to the rated capacity of 50 tons daily. The new reagent developed by U. C. Tainton has been effective in preventing excessive atmospheric spray in the cellroom.

Varying Movements in European Markets

British Pig Iron Recovery and German Dullness—Japan to Make Steel Piling—French Scrutinize Wages

(*By Cable*)

LONDON, ENGLAND, Nov. 11.

PIG IRON is rather more active on domestic buying for forward delivery and some small lots of Cleveland iron have been sold for export. Output of pig iron is likely to be restricted temporarily, as Bolckow, Vaughan & Co. are blowing out two furnaces for repairs and arranging to resume operation of two others shortly.

At present, furnaces are generally well engaged through November, but are faced with continually increasing costs. Hematite iron is strong, with good domestic and export demand and East Coast, mixed numbers, has sold at £3 18s. ($18.94) per ton for prompt shipment and £4 1s. ($19.68) a ton for January delivery. The Steel Makers Association is leaving prices unchanged, contrary to the expectations of domestic users, who have bought heavily in anticipation of advances. Mills are now fairly well booked, but still lack export orders.

Tin plate is moderately active and prices are being maintained despite weakness in the tin market. Mills are well occupied and world consumption of tin plate is considered to be increasing steadily. Consequently, producers are optimistic of the future.

There is slightly more activity in galvanized sheets, but, with lower costs, makers have accepted £12 15s. per ton (2.76c. per lb.), f.o.b., for No. 24 gage corrugated sheets in bundles, although the market is slightly higher. Black sheets are quiet.

A lockout of shipyard joiners, involving more than 10,000 men, has been declared by employers, effective Nov. 23.

The Stanton Ironworks Co., Nottingham, is starting a new plant for production of De Lavaud centrifugal cast iron pipe, which will increase its output by 15 miles a week.

Continental iron and steel prices are steadier as a result of the International Steel Cartel's decision to reduce production. The situation is complicated, however, by increased export demand experienced by British traders, while mills report cancellations.

German Steel Business Declines

Buyers Await Renewal of Syndicates—Exports Suffer From Belgian and American Competition

BERLIN, GERMANY, Oct. 25.—The business outlook is uncertain. Steel production is still at a higher rate than in 1928, but buying has fallen off considerably. Domestic steel prices for November are unchanged, but further weakness has developed in the export market. As a result, the Ingot Steel Syndicate has made another increase in its price rebates to exporting manufacturers on certain steel products. For November these rebates are, per metric ton: ingots, 12 m. ($2.86); billets, blooms and slabs, 19 m. ($4.52); structural shapes, 36 m. ($8.57); steel bars, 33 m. ($7.85); bands, 42 m. ($10); wire rods, 21.50 m. ($5.12); and heavy-gage sheets, 20 m. ($4.76). There has been considerable discussion of rebates during recent negotiations for renewal of the domestic syndicates, and manufacturing consumers generally agree that the system is materially aiding export trade in machinery and electrical equipment.

Some of the caution now being shown by iron and steel buyers is at-

British and Continental European Export Prices per gross ton, f.o.b. United Kingdom Ports, Hamburg and Antwerp, with the £ at $4.85

*Open-hearth steel, 10s. ($2.42) per ton extra.

tributed to the doubtful outlook for both domestic and foreign business and also to the uncertainty about the renewal of many of the syndicates. Within a month meetings will be held of the Ingot Steel Syndicate, the "A" Products Syndicate and the Steel Bar Syndicate. To simplify the negotiations it has been agreed that all these syndicates, including the Wire Rod Syndicate, shall expire simultaneously, probably Jan. 31.

The demand of the Friedrich Krupp A.G. for a 175,000-ton quota in the Ingot Steel Syndicate is reported to have been withdrawn. This move is expected to pave the way for an agreement among the Krupp works, the Mannesmann Tube Co. and the United Steel Works. However, the plan of the Friedrich Krupp A.G. to establish a new tube mill of large capacity has not yet been abandoned and constitutes a serious threat to renewal of the German Tube Syndicate. Negotiations in the Ingot Steel Syndicate will involve redistribution of quotas, and a decision on separation of export from domestic allotments. On this latter question there is a wide divergence of opinion between producers selling largely in the domestic market and mills producing almost exclusively for export.

The prospect of renewal of the International Steel Cartel has improved, following the reported abandonment by Belgium of opposition to the establishment of price-fixing, selling organizations for separate products. This change in attitude is said to have resulted from a decline in prices and business in Belgian export trade.

Foreign Trade Threatened

It appears doubtful that the present high rate of steel production will be maintained much longer, as trade is declining slowly. Curtailed exports will probably be reflected in reduced German purchases of American cotton, copper and other materials. The situation in the export market is illustrated by a comparison of German and Belgian prices. Although German mills state that they are selling abroad at present quotations without profit, German prices are still higher than Belgian. German blooms, for example, are quoted at £4 14s. 6d. ($22.95), and Belgian at £4 5s. 6d. ($20.78) per metric ton, f.o.b. Antwerp; German billets at £4 15s. 6d. ($23.21) per ton and Belgian at £4 11s. 6d. ($22.23), Antwerp; German shapes at £5 1s. per ton (1.11c. per lb.) and Belgian at £4 18s. per ton (1.08c. per lb.); German steel bars at £5 4s. per ton (1.15c. per lb.) and Belgian at £5 3s. per ton (1.13c. per lb.).

German steel exports can apparently be maintained only by further reductions in prices. Recently certain producers, including the mills at Essen, have reported increasing competition in South American markets from American mills and a resultant decline in German business. Exports to the Far East have receded, also, Chinese buying being at a minimum.

Japan to Roll Steel Piling

German Design Considered — Government Works May Install Rail Steel Bar Mill to Reroll Short Rails

YOKOHAMA, JAPAN, Oct. 15.—The Seitetsu Jo (Government Works) is increasing its steel making capacity and adding new products to its output. It is planned to build a new plant at Horaoka, replacing the company's No. 1 mill, which is to be removed from Yawata and rebuilt. Present plans call for an annual output of 500,000 metric tons of steel ingots from either seven or eight furnaces of not less than 100 metric tons capacity.

Recently the various designs of sheet steel piling imported by Japan have been investigated by the company with a view to developing a special Japanese design. Japan imported 22,000 metric tons of the various types of steel piling in 1928. It has now been decided to obtain the patent rights for Japan on the most desirable design, and Larssen piling, manufactured by the Vereinigte Stahlwerke A.G. in Germany, is understood to have been selected.

For some months the Seitetsu Jo has been trying to find an outlet for short-length and other waste rails, an increasing tonnage of which has become available as output of the rail mills has mounted. Part of these off-grade rails has been purchased by the Imperial Government Railways, but there is still a considerable tonnage, which cannot be economically charged into the open-hearth furnace as heavy melting steel. In certain districts small quantities of these waste rails have been used by cutlery makers. Recently the possibility of installing a mill to roll rail steel reinforcing bars, fence posts and similar material, as in the United States, has been considered, and it has been suggested also that these rails might be rolled flat for use in manufacturing scoops and shovels.

The Vereinigte Stahlwerke, A. G., recently licensed the Cargo Fleet Iron Co., Litd., Middlesbrough, England, to roll Larssen steel piling for distribution in Great Britain and the British dominions and colonies.

New British Steel Merger Being Considered

LONDON, ENGLAND, Nov. 2.—Merger of the Pearson & Knowles Coal & Iron Co., Ltd., Warrington, with Sir W. G. Armstrong, Whitworth & Co., Ltd., is contemplated. The latest report from the latter interests is that the iron and steel business of the Pearson & Knowles group of companies is being carefully studied with this end in view. The Pearson & Knowles group has a weekly capacity of about 2700 tons of finished iron and steel from 45 puddling furnaces, six bar mills, four hoop mills and one wire rod mill. It draws its steel supplies from the Partington Steel & Iron Co., Ltd., which it controls.

In 1920 Sir W. G. Armstrong, Whitworth & Co., Ltd., acquired a controlling interest in the Pearson & Knowles Coal & Iron Co., by purchase of its stock. With the exception of two of its coal properties all the companies in the group have shown a general improvement in earnings.

American Motor Car Builder Studies French Wages

BORDEAUX, FRANCE, Nov. 1.—Investigations of wage rates paid by the automobile industry in various Continental countries, now being made by a leading American automobile manufacturer, have attracted considerable attention in France. There is much conjecture as to the use that will be made of this information and a belief in some quarters that it portends large production operations by this manufacturer in some European country, possibly France.

It is pointed out that, if American automobile builders start production in the French market and offer a higher rate of wages than the standard in France, French producers can follow their lead and also advance the wage level. It is argued, however, that, if higher wages should prove unprofitable in France, the first to be forced to suspend them would be the French factories, since they have less capital than the American builders.

Russia Suggests Manganese Agreement

HAMBURG, GERMANY, Nov. 1.—The Russian Government, which controls the Georgian Manganese Ore Co., has approached producers in South Africa, India and Brazil with an offer to negotiate an agreement to prevent further price reductions, according to the official Government trade publication *Ekonomitscheskaja Shin.* It is believed that negotiations will result in stabilized world prices of manganese ore.

Italian Steel Companies to Be Merged

The Societa Altiforni & Acciaierie D'Ilva, a leading Italian steel company, with capital stock totaling 300,000,000 lire ($15,705,000), will absorb the Societa Anonima Franchi Gregorini of Brescia, with capital of 90,000,000 lire ($4,711,500), and the Societa Anonima Ferriere di Veltri of Genoa, with capital of 45,000,000 lire ($2,355,750), according to a report to the Department of Commerce. Financing is to be through the Banco Commerciale and Credito Italiano.

Machinery Markets and News of the Works

Tool Sales Drop Slightly

Machinery Business Feels Some Effects of Stock Market Crash—Outlook Still Uncertain

WHILE orders and inquiries for machine tools are described as "better than fair," there has been some falling off in the past week. Most significant, perhaps, is the fact that some prospective business will not be placed because of curtailment of manufacturing programs of the companies which were to buy. This is most noticeable in aircraft, radio and electric refrigerator lines. Deliveries on a few machine tool orders recently placed have been held up, at least temporarily.

On the other hand, some companies are going ahead with plans for 1930 without regard for any possible effect on business that the recent stock market break may have. Within the past week sales of tools have been made with deliveries extending as far ahead as April.

Machine tool plants are well filled with orders, and few are able to make shipments of tools until after Jan. 1.

The effect which the collapse in security values may have is discussed by the National Machine Tool Builders in its November bulletin, which says that "we are pretty sure to find a goodly recession in demand on account of the stock market smash."

This report says that some cancellations have already developed from "the over-enthusiastic aircraft industry and perhaps such cancellations might develop in other industries due to lack of business confidence."

The association adds, however, that "a period of falling demand will not be entirely unhealthy."

"Unfortunately for the machine tool industry," says the report, "the motor industry is the sore spot in the whole business structure at this time, and the motor industry has been the largest single source of machine tool orders for many years past. As the motor industry is quite close to its saturation point, we need not expect in the future as many orders from the motor industry as a whole because that industry is stopping its expansion."

New York

NEW YORK, Nov. 12.—As expected, the recent stock market collapse has had an almost immediate effect on the manufacturing programs of companies engaged in the so-called luxury class of goods. Curtailment has occurred in the production of electric refrigerators and radios. A large manufacturer of radio tubes has postponed contemplated purchases of machine tools because of the probability of a reduced demand for its product. Spotty conditions are developing in the local machine tool trade, though some sellers declare that sales and inquiries are still "better than fair." Others report a decline in volume of orders booked thus far in November, as compared with October volume. In contrast with this situation, it is significant that within the week tools have been sold for shipment as far ahead as next April. During the remainder of the year machine tool sales will undoubtedly be governed to a large extent by the business prospects of individual companies and to a lesser extent than usual by inventory considerations which ordinarily are a factor at the end of every year. Scarcely any machine tools purchased now can be delivered until after Jan. 1, and most inventories are completed by that time.

Keystone Foundry Co., Essex Street, Brooklyn, manufacturer of iron castings, has engaged E. M. Edelson, 26 Court Street, architect, to prepare plans for two one-story foundry units, 95 x 100 ft., to cost about $60,000 with equipment.

Board of Education, Amsterdam, N. Y., is considering installation of manual training department in high school in Northampton Park, to cost $600,000, for which plans are being drawn by H. F. Daly, 15 East Main Street, architect.

Following recent acquisition by Western Electric Co., 195 Broadway, New York, of Turner-Armour Corporation, 1201 Flushing Avenue, Brooklyn, with branch plant at 6600 Metropolitan Avenue, Queens, manufacturer of telephone booths, etc., purchasing company is arranging to increase production of new type metal-lined telephone booths from 1600 to 2000 units per month. F. A. MacNutt is works manager.

Leviton Mfg. Co., 226 Newell Street, Brooklyn, manufacturer of electrical porcelain specialties, has awarded general contract to W. P. McGarry Co., 2929 Freeman Avenue, for four-story plant, 105 x 160 ft., to cost more than $135,000 with machinery, presses, etc.

Board of Education, Park Avenue and Fifty-ninth Street, New York, has plans for a power house for institutional building at Jerome Park reservoir, project to cost $750,000 with equipment. Thompson, Holmes & Converse, 101 Park Avenue, New York, are architects.

Nevins Shipyard, City Island, New York, has plans for two-story shop addition, to cost about $30,000 with equipment. Franklin, Bates & Heindsman, 2526 Webster Avenue, are architects.

Claude Neon Electrical Products Corporation of Delaware, affiliated with Claude Neon Lights, Inc., 41 East Forty-second Street, New York, manufacturer of tube electric lights, etc., has arranged for consolidation with Claude Neon Electrical Products Corporation of Oregon, Inc., and will consolidate with organization. It is planned to expand production on Pacific Coast.

Van Wart & Wein, 347 Madison Avenue, New York, architects, have plans for a one-story machine shop, 100 x 215 ft., at Long Island City, to be occupied by a company whose name is temporarily withheld, represented by T. Steele, 482 Vernon Boulevard, Long Island City.

William Shary, 22 East Seventeenth Street, New York, architect, has filed plans for a multi-story automobile service, repair and garage building at 12-16 East Thirteenth Street, to cost about $125,000 with equipment.

United States Nickel Co., at North Brunswick Township, near New Brunswick, N. J., has arranged for dissolution of company, and plant will be discontinued. Production will be continued by parent organization, Usines De Nickel De La Nethe, with plant at Duffel, Belgium. Walter C. Kerrigan, Highland Park, N. J., is secretary and treasurer of United States Nickel Co., and is said to be planning to place company plant on market.

Driver-Harris Co., Middlesex Street, Harrison, N. J., manufacturer of wire products, will soon take bids for about seven two and three-story additions, to cost over $350,000 with equipment. J. A. Finegan, 776 Broad Street, Newark, is architect.

Kirchhof Patent Co., Newark, manufacturer of tin toys and other metal novelties, has removed its plant from 30 Stirling Street to a larger factory at 60-64 Union Street, where production will be expanded.

Warren Foundry & Pipe Co., Sitgreaves

Street, Phillipsburg, N. J., is considering rebuilding one-story unit destroyed by fire Nov. 2.

Tung Sol Lamp Works, Inc., 95 Eighth Avenue, Newark, manufacturer of radio tubes and equipment, has taken bids on general contract for a four-story addition, 100 x 150 ft., to cost more than $125,000 with equipment. Fougner & Gautier, 103 Park Avenue, New York, are architects.

Beaver Mfg Co., 625-45 North Third Street, Newark, manufacturer of electric wiring devices, switches, etc., has completed a two-story addition, 50 x 100 ft., and will use in part for a new assembling department.

Hackensack Water Co., Park Avenue, Weehawken, N. J., has plans for an equipment storage and distributing plant on Hackensack Avenue, Hackensack, with automobile service, repair and garage building for company cars and trucks, to cost over $85,000. C. V. R. Bogert, 210 Main Street, Hackensack, is architect.

Charles Miller & Co., Secaucus Road, North Bergen, N. J., have superstructure under way on two-story addition, 38 x 110 ft., to be equipped as a cooling and freezing department for adjoining three-story meat-packing plant, with part to be used as an engine room, to cost over $70,000 with equipment. Otto S. Schlick, 136 Liberty Street, New York, is architect and engineer.

New England

BOSTON, Nov. 11.—Although machine tool dealers report sales larger than a week ago, the trade in general describes the market as dull. Some prospects have signified intentions of closing in December, but more have postponed purchases until after Jan. 1. Dealers have figures out on a large number of tools, however, and buying, when resumed, in all probability will be good. New England machine tool builders report a further falling off in bookings, but deliveries are still unsatisfactory to a majority of users. Metal-working plants are not so busy as in October, but more active than in November last year. The present let-down in operations is seasonable.

New England Fuel & Transportation Co. will build coal elevators at 140 Ballou Avenue, Dorchester district, Boston; also a coke storage plant at 140 Abattoir Avenue, Brighton district.

Fairfield County Ice Co., Stamford, Conn., has awarded a contract for a one-story plant, 80 x 220 ft., for which miscellaneous electrical and other equipment is required.

Boston & Maine Railroad will soon begin work on a locomotive coaling plant at Worcester, Mass. Conveying equipment will be purchased.

William E. Arnold Co., Malden, Mass., will erect a machine shop to cost $25,000 without equipment.

International Silver Co., Meriden, Conn., closed bids Nov. 8 on one, two and three-story additions and alterations. Company has under consideration purchase of drop hammers.

Electric Specialty Co., Stamford, Conn., has awarded a general contract for a two-story addition, 44 x 120 ft.

N. D. Cass Co., Athol, Mass., maker of toys, has purchased International Toy Corporation, New Bedford, Mass., and will move machinery to Athol. New metal-working equipment will be purchased later.

Stanley Electric Tool Co., New Britain, Conn., a subsidiary of Stanley Works, has been incorporated. New company has acquired Unishear Co. and Ajax Electric Hammer Co., both of New York, and will manufacture products of these concerns together with electric machinery formerly made by Stanley Rule & Level Co. at New Britain.

City Council, New Britain, Conn., is planning purchase of property for a municipal airport, to include hangar, repair shop, oil storage and other structures, to cost more than $75,000 with equipment. R. W. Whitman, councilman, is member of committee in charge.

Boston Ice Co., 11 Deerfield Street, Boston, has acquired property on East Eagle Street, and contemplates new plant, to cost more than $90,000 with machinery.

Fenn Mfg. Co., 1841 Broad Street, Hartford, Conn., manufacturer of special machinery, tools, etc, has awarded general contract to R. G. Bent Co., Inc., 93 Edwards Street, for one-story top addition, to cost about $30,000 with equipment.

The Crane Market

NEW inquiry for locomotive cranes has improved in the past week, and the market for used equipment is showing increased activity. The Tide Water Oil Co., 11 Broadway, New York, is inquiring for a 25-ton locomotive crane, the Standard Oil Co. of New Jersey for two 25-ton locomotive cranes for Bayway, N. J., and the Anglo-Chilean Consolidated Nitrate Corporation, New York, for a 25-ton and a 35-ton locomotive crane for export. The Bethlehem Shipbuilding Corporation, Bethlehem, Pa., has not yet closed on a 50-ton locomotive crane. Overhead crane inquiry continues rather limited. Among inquiries expected to close soon is a 25-ton, 1-motor overhead crane for the Phoenix Utility Co., 71 Broadway, New York.

Among recent purchases are:

Magnolia Petroleum Co., New York, 35-ton, 32-ft. 11¾-in. span, overhead crane for Beaumont, Tex., from Box Crane & Hoist Corporation.

E. I. du Pont de Nemours & Co., Wilmington, Del., 10-ton, 27-ft. span electric traveling crane from Shepard Niles Crane & Hoist Corporation.

Sinclair Refining Co., New York, 10-ton, 42-ft. span, electric crane for new refinery at Wellsville, N. Y., from Maris Brothers.

General Electric Co., Schenectady, N. Y., four 2-ton electric cranes for Bloomfield, N. J., from Shepard Niles Crane & Hoist Corporation.

Chicago, Rock Island & Pacific, 10-ton, 30-ft. span, 2-motor stationary gantry crane from Whiting Corporation.

Navy Department, Mare Island, Cal., 30-ton, steam-driven locomotive crane from Orton Crane & Shovel Co.

St. Louis River Mercantile Co., Cloquet, Minn., 30-ton oil driven locomotive crane from Orton Crane & Shovel Co.

Monessen Southwestern Railroad, Monessen, Pa., 30-ton, gasoline operated locomotive crane from Orton Crane & Shovel Co.

United States Rubber Co., Providence, R. I., has asked bids on general contract for addition to mill on Valley Street, to cost over $50,000 with equipment. Lockwood Greene Engineers, Inc., 24 Federal Street, Boston, is architect and engineer. Headquarters of company are at Broadway and Fifty-eighth Street, New York.

duPont Viscoloid Co., Leominster, Mass., has awarded contract to Wiley & Foss, Fitchburg, Mass., for addition to plant for manufacture of new type of safety glass for automobiles, to cost about $1,000,000 with machinery. Company will rebuild small unit at plant recently damaged by fire.

Philadelphia

PHILADELPHIA, Nov. 11.—Wicaco Screw & Machine Works, Inc., 4801 Stenton Avenue, Philadelphia, has awarded general contract to Paul Brosz, 2515 West Huntingdon Street, for a one-story addition, to cost about $30,000 with equipment.

Tilden, Register & Pepper, 1608 Walnut Street, Philadelphia, architects, have filed plans for a multi-story automobile service, repair and garage building at 1616-26 Walnut Street, to cost more than $350,000, of a gross expenditure of $2,000,000 to be made for other building at same location.

Shell Eastern Petroleum Products, Inc., 122 East Forty-second Street, New York, a subsidiary of Shell Union Oil Co., Shell Building, St. Louis, has purchased 4½-acre tract on Schuylkill River, near Grays Ferry Bridge, Philadelphia, and plans early construction of oil storage and distributing plant, to cost more than $125,000 with equipment. Property was formerly occupied by Philadelphia Rubber Co.

Mechanical handling equipment will be installed in new one-story loading station to be built by Freihofer Baking Co., Twentieth Street and Indiana Avenue, Philadelphia, to cost about $75,000. General contract has been let to Philip Haibach Contracting Co., 1261 North Twenty-sixth Street.

Brockway Motor Truck Corporation, 4500 Woodland Avenue, Philadelphia, with plant at Cortland, N. Y., has awarded general contract to Nelson Pedley Construction Co., 9 South Sixteenth Street, for a service, repair and sales building, to cost over $90,000 with equipment. Eugene A. Stopper, Fuller Building, is architect.

Ralph B. Bencker, Horn Building, Philadelphia, architect, has plans for a six-story and basement factory, 90 x 95 ft., to be known as the Jewelry Trade Building, for precision and light manufacturing in this industry, to cost $250,000.

Public Service Electric & Gas Co., Trenton, N. J., with headquarters at Public Service Terminal Building, Newark, N. J., has plans for an equipment storage and distributing plant, with mechanical and electrical repair departments, to cost $100,000 with equipment. Work will be in charge of Public Service Production Co., same address, an affiliated organization.

Central Transportation Co., Broad Street Bank Building, Trenton, has plans for a one-story motor bus service, repair and garage building, 100 x 250 ft., for company use, reported to cost about $85,000 with tools and equipment.

School Board of Lower Wakefield Township, Yardley, Pa., is considering installation of manual training equipment in new two-story high school to cost $160,000, for which plans will be drawn

by Heacock & Hokanson, 1211 Chestnut Street, Philadelphia, architects.

Autocar Co., Ardmore, Pa., manufacturer of motor trucks, has approved increase in capital from 100,000 shares of stock, $100 par value each, to 600,000 shares, no par value, part of proceeds to be used for expansion.

State Board of Education, Trenton, N. J., will have plans drawn soon for power plant for new school group at Hillwood Lake, entire project to cost $985,000, which amount has been authorized by State.

Stacy Paper Box Co., Ewing and Ogden Streets, Trenton, N. J., manufacturer of corrugated and other paper folding boxes and containers, has leased local factory units held by Trent Corporation, and will occupy what is known as Building No. 1 for new plant. Present factory will be removed to new location and capacity increased. Expansion will cost more than $40,000 with equipment.

South Atlantic

BALTIMORE, Nov. 11.—Victor Cooler Door Co., Inc., First National Bank Building, Hagerstown, Md., manufacturer of insulated refrigerator doors, etc., has awarded general contract to J. B. Ferguson Co., 39 West Washington Street, for one-story addition to plant on Frederick Street, to cost over $100,000 with equipment.

Baltimore & Ohio Railroad Co., Baltimore, has awarded general contract to Olga Construction Co., Chicago, for new coal tipple at Fairmont, W. Va., with electric hoists and other mechanical handling equipment, to cost over $60,000. H. A. Lane is chief engineer.

Webb Packing Co., Crisfield, Md., meat packer, has authorized immediate erection of new branch plant at Salisbury, Md., on site recently acquired, to include refrigerating department, mechanical-handling equipment, etc., to cost about $140,000.

H. Warwick, Vermont Avenue, N. W., Washington, architect, has plans for a three-story automobile service, repair and garage building, to cost about $100,000 with equipment.

Virginia Electric & Power Co., Richmond, Va., has acquired local property and plans construction of two-story equipment storage and distributing building, with mechanical and electrical repair divisions, 125 x 300 ft., to cost more than $150,000 with equipment. Carneal, Johnson & Wright, Electric Building, are architects.

Dominion Oil Co., Richmond, Va., has plans for oil storage and distributing plant, to cost $125,000 with equipment.

Horace E. Dodge Boat & Plane Corporation, 3 East Fifty-second Street, New York, Horace E. Dodge, president, recently organized to take over Horace E. Dodge Boat Works, Inc., 614 Lycaste Avenue, Detroit, has awarded general contract to Virginia Engineering Co., First National Bank Building, Newport News, Va., for new plant at Newport News, where 100-acre tract was lately purchased. Plant will consist of several units for parts manufacture and assembling of motor boats, flying boats and amphibian planes, with power substation, boiler house, dock and other miscellaneous structures, to cost about $1,000,000. It is proposed to construct additions later to more than triple this investment. Plant at Detroit will be removed to new location. Philip L. Small & Associates, Terminal Tower Building, Cleveland, are architects and engineers.

Maryland Bolt & Nut Co., Mount Washington, Baltimore, has awarded general contract to Consolidated Engineering Co., 20 East Franklin Street, for two-story addition, 30 x 60 ft., to cost about $20,000 with equipment.

Curtiss Airports Corporation, 27-29 West Fifty-seventh Street, New York, has begun construction of two hangars, with repair facilities at new airport at Baltimore, where 260-acre tract will be laid out for this purpose. Oil storage and distributing building and other units will be built, followed by administration building in spring. Entire project will cost more than $100,000. Kenneth Franzheim, 345 Madison Avenue, New York, is architect. General contract is in charge of Stone & Webster Engineering Corporation, 49 Federal Street, Boston, engineer and contractor.

Boland Mfg. Co., Greenville, S. C., manufacturer of shuttles and other textile mill equipment, has taken over property on Old Ensley Road, and will operate temporary plant at that location. New plant will be built later.

Pittsburgh

PITTSBURGH, Nov. 11.—Dealers report sufficient business in prospect to keep local offices well occupied. New inquiry is appearing daily, but lists of more than a few tools are exceptional. Purchases are being made in the same way, although awards are expected in the next few days on the Pittsburgh Board of Education's list which closed last week and included a considerable number of tools.

Many large steel companies whose operations have been considerably reduced in the last few weeks are taking advantage of the opportunity to make additions and repairs to equipment. Builders of heavy machinery are well occupied and the time of delivery is often the deciding factor in placing an order.

Edgewater Steel Co., Oakmont, Pa., has asked bids on general contract for two-story addition, to cost about $45,000 with equipment. Part of unit will be used for testing.

Semler Co., Jeannette, Pa., manufacturer of steam and water pipe fittings, flanges and flange unions, etc., has awarded general contract to J. E. Myers, Jeannette, for one-story addition, totaling about 10,000 sq. ft. floor space, primarily for manufacture of brass fittings, to cost about $35,000 with machinery.

Firestone Tire & Rubber Co., Akron, Ohio, will soon call for bids for three-story factory branch, storage and distributing plant at Pittsburgh, to cost more than $225,000 with equipment. Lockwood Greene Engineers, Inc., Hanna Building, is architect and engineer.

Austin Motor Car Co., Butler, Pa., recently organized to take over part of plant of Standard Steel Car Co., has plans by A. J. Brandt Co., 412 Stormfeltz Building, Woodward Avenue and Grand Boulevard, Detroit, engineer, for extensions and improvements, to cost about $100,000. List of equipment is being arranged. Mr. Brandt is interested in Austin company.

Dunbar Flint Glass Co., Dunbar, W. Va., has plans for extensions and improvements, including installation of batch-mixing, mechanical-handling and other apparatus, to cost about $200,000.

Globe Brick Co., Kenilworth, W. Va., has awarded general contract to Austin Co., Euclid Avenue, Cleveland, for two additions, one-story, 65 x 225 ft., and two-stories, 40 x 60 ft., for production of glazed face brick, to cost about $100,000 with machinery.

K. Simon, 160 Fullerton Street, Pittsburgh, operating a wagon building and repair works, will soon take new bids on revised plans for a two-story addition, 45 x 65 ft., to cost $45,000 with equipment. A. R. Douglass, Benedum Trees Building, is architect.

Acme Steel Co., Glassmere, Pa., manufacturer of electric steel castings, is making additions to its foundry buildings, 80 x 200 ft. and 40 x 80 ft., and will install additional crane, annealing oven, core ovens, air compressor and other equipment. Capacity will be increased 60 per cent.

Buffalo

BUFFALO, Nov. 11.—Sterling Engine Co., 1250 Niagara Street, Buffalo, manufacturer of gas engines, parts, etc., has filed plans for one-story addition, to cost about $80,000 with equipment.

Walker Lee, Jr., Powers Building, Rochester, N. Y., architect, has awarded general contract to William Kenny, 86 Frost Avenue, for five-story automobile service, repair and garage building, to cost about $100,000 with equipment.

Officials of Houdaille-Hershey Corporation, 537 East Delavan Avenue, Buffalo, manufacturer of automobile shock absorbers, have organized Houdaille Co. of Canada, Ltd., a subsidiary, to construct and operate a branch plant at Bridgeburg, Ont., initial unit to cost more than $75,000 with equipment.

Rochester Button Co., 300 State Street, Rochester, has leased property at Akron, N. Y., and will install machinery early in December for a branch plant. Equipment will be provided for employment of about 100 persons. Joseph D. Tonkin is general manager.

Sun Oil Co., 1609 Walnut Street, Philadelphia, is asking bids on general contract for a new storage and distributing plant at Tonawanda, N. Y., including automobile service, repair and garage building for company trucks and cars, to cost about $200,000 with equipment.

Board of Education, Fayetteville, N. Y., is considering installation of manual training equipment in new senior and junior high school in Wellwood section, to cost about $300,000. Carl C. Ade, 89 East Avenue, is architect.

Erie Railroad Co., 50 Church Street, New York, is considering addition to locomotive repair shops at Hornell, N. Y., 150 x 150 ft., to cost more than $85,000 with equipment. R. C. Falconer, address noted, is chief engineer.

Quisenberry Feed Mfg. Co., 95 Kentucky Avenue, Buffalo, has filed plans for six-story addition to mill, including grain elevator with screening, conveying, hoisting and other equipment, to cost about $100,000. S. T. Edwards, 110 South Dearborn Street, Chicago, is engineer.

Westcott Chuck Co., Oneida, N. Y., has appointed G. L. Hunt, Bourse Building, Philadelphia, its representative in that territory, which includes eastern Pennsylvania, Maryland, Delaware and southern New Jersey. Other recent appointments are: Buffalo, Noxsel-Stroman Co., 14 East Tupper Street; Chicago, S. A. Dinsmore, 327 South La Salle Street; Los Angeles and San Francisco, K. D. Carl-

son Co., 268 Market Street, San Francisco; Pittsburgh, F. A. O'Donnell, 1509 First National Bank Building.

Universal Pressing Machine Co., Inc., recently organized at Utica, N. Y., with Cambell B. Hodges, president, will establish a plant in former Otis Boiler works, Oswego, N. Y. Operations are expected to begin about Jan. 1.

Detroit

DETROIT, Nov. 11.—Following recent consolidation with Thomson Electric Welding Co., Lynn, Mass., Gibb Welding Machines Co., Bay City, has secured three-acre tract for expansion, to cost over $75,000 with equipment. Consolidated company will be known as Thomson-Gibbs Electric Welding Co.

Detroit Die-Casting Co., 442 East Jefferson Avenue, Detroit, has asked bids on general contract for one and two-story plant unit, to cost about $70,000 with equipment.

National Utilities Co., Monroe, Mich., operating electric and gas properties, has purchased 22-acre tract about two miles from city, as site for new artificial gas plant, with a capacity of 1,000,000 cu. ft. daily. New storage and distributing facilities will be provided with capacity of 300,000 cu. ft. Present gas generating plant will be used for auxiliary service. Entire project will cost over $700,000.

Kelsey Wheel Co., 3600 Military Avenue, Detroit, manufacturer of steel automobile wheels, etc., has asked bids on general contract for a one-story addition, 130 x 320 ft., to cost about $100,000 with equipment. Albert Kahn, Inc., Marquette Building, is architect and engineer.

Board of Trustees, University of Detroit, Livernois Avenue and Six-Mile Road, Detroit, has plans for a new two-story engineering building, adjoining present structure, to cost more than $100,000 with equipment. Malcolmson & Higginbotham, 1219 Griswold Street, are architects.

Evans Auto Loading Co., Union Trust Building, Detroit, manufacturer of automobile loading devices and equipment, is completing new branch plant at Marshfield, Ore., to cost about $400,000.

Thompson Aeronautical Corporation, Union Trust Building, Cleveland, manufacturer of aircraft and automobile equipment and parts, has plans for new plant at Pontiac, Mich., including one-story shop and office, 40 x 120 ft.; hangar, 120 x 120 ft., with repair and reconditioning facilities; one-story engine-testing house, 15 x 24 ft.; boiler house and other units, to cost $375,000 with equipment.

White Star Refining Co., 903 West Grand Boulevard, Detroit, has begun construction of new lubricating oil plant, to cost more than $90,000 with equipment. It will also build a storage and distributing plant, and sign-manufacturing unit, to cost over $75,000 with equipment. A new oil refinery at Trenton, Mich., representing an investment of more than $2,000,000, was recently completed.

Wayne County Board of Commissioners, Barlum Tower, Detroit, will soon take bids on revised plans for one-story county power plant, to cost about $70,000 with equipment. Giffels & Vallet, Marquette Building, are architects and engineers.

Yellow Sleeve Valve Engine Works, Inc., East Moline, Ill., a subsidiary of General Motors Corporation, manufacturer of engine valves and other equipment, is planning early removal of plant to Pontiac, Mich., where part of engine works of parent organization has been taken over. Additional facilities will be installed for enlarged output.

Chicago

CHICAGO, Nov. 11.—In general, the past week has been rather quiet for the machine tool trade. Scattered orders have been added to books, but the bulk of this business is of old standing. New inquiries are at the lowest point in many weeks. Contrary to the trend of the general market, there have been a few orders for duplicates of machines purchased earlier in the year. Salesmen reporting to home offices do not find that recent rapid changes in the security market have resulted in dropped programs or in cancellations. Tool and die shops having contracts with the Western Electric Co. are still busy. However, jobbing shops that have been doing work for radio manufacturers have had some contracts cancelled, and it is reported that several automobile manufacturers east of Chicago have held up delivery of machine tools recently ordered.

The Burlington is in the market for a portable lathe, and the Louisville & Nashville will buy a turret lathe. Additional requests have come from railroads for estimates to be used in preparing budgets for 1930.

W. J. Korber, 263 North California Avenue, Chicago, will build a two-story machine shop, 52 x 127 ft., to cost $37,000. L. M. Mitchell, 127 North Dearborn Street, is architect.

Factory of Rich Toy Co., Morrison, Ill., was badly damaged by fire Nov. 8.

B. D. and H. D. Adams, owners of Adams Mfg. Co., Galesburg, Ill., have purchased Meyer-Foley Co., same city, and will consolidate operations. Automotive accelerators, footrests, pressed steel pulleys, metal stampings for washing machines and similar special machinery are manufactured.

Willis Motor Corporation, Maywood, Ill., has acquired property near Batavia, Ill., and contemplates erection of a large plant to manufacture motors.

Foote Gear Works, Chicago, has moved from 430 North Oakley Boulevard to 1301 South Cicero Avenue.

Compressed Industrial Gases, Inc., 19 North Sheldon Street, Chicago, through its subsidiary, Burdett Oxygen & Hydrogen Co., Chicago, manufacturer of oxygen, hydrogen and acetylene, has plans for a dissolved acetylene plant at Summit, Ill., industrial suburb of Chicago, to cost, with equipment, about $100,000.

Factory addition of Gardner-Denver Co. at Quincy, Ill., is nearing completion. Company manufactures slush and mud pumps, air compressors, rock drills, drill sharpeners and high pressure drill steel forges. Its other two plants are at Denver and LaGrange, Mo.

Schlangen Brothers Co., 2435 Irving Park Boulevard, Chicago, manufacturer of builders' hardware, etc., is considering multi-story plant addition, to cost over $200,000 with equipment.

G. F. Wright Steel & Wire Co., 13 West Ohio Street, Chicago, manufacturer of wire goods, wire cloth, etc., has leased four floors in building at 22 West Austin Avenue for new plant. Present capacity will be increased.

Kling Brothers Engineering Works, Inc., 1300 North Kostner Avenue, Chicago, operating a general machine plant, has filed plans for a two-story addition, 50 x 60 ft., to cost about $45,000 with equipment.

Illinois Cork Co., 1450 West Forty-third Street, Chicago, contemplates early rebuilding of part of plant destroyed by fire Nov. 3, with loss reported close to $100,000, including equipment.

Chicago, St. Paul, Minneapolis & Omaha Railroad Co., 275 East Fourth Street, St. Paul, Minn., has awarded general contract to J. B. Nelson Construction Co., Mankato, Minn., for new engine house and shops at Mankato, to cost more than $60,000 with equipment. H. E. Barlow, address noted, is chief engineer.

Christy Mfg. Co., Pueblo, Colo., A. B. Christy, Vail Hotel, head, has plans for new two-story and basement plant to manufacture juvenile furniture and kindred products, to cost about $100,000 with equipment.

Bureau County Board of Supervisors, Princeton, Ill., E. L. Schoenberger, American Hotel Building, in charge, has plans for a one-story machine and repair shop, to cost about $30,000 with equipment.

Northwest Airways, Inc., Merchants National Bank Building, St. Paul, Minn., has awarded general contract to Paul Steenberg Construction Co., Builders' Exchange Building, for hangar, 130 x 200 ft.; machine and repair shop, 30 x 200 ft., and other units at St. Paul airport, to cost $100,000 with equipment. L. H. Brittin is vice-president and general manager.

Spanjer Brothers, Inc., 1160 Chatham Court, Chicago, manufacturer of signs, displays, etc., has awarded general contract to B. J. Regnall Co., 19 South LaSalle Street, for three-story addition, 25 x 150 ft., to cost about $60,000 with equipment. H. Ronneberg, 10 South LaSalle Street, is architect.

Northern Pacific Railroad Co., St. Paul, Minn., is planning extensions and improvements in repair shops and yards at Glendive, Mont. Present car repair shop at Dickinson, Mont., will be removed to Glendive and capacity increased. Program will cost about $70,000 with equipment.

Cleveland

CLEVELAND, Nov. 11.—Machine tool sales were rather light the past week and were limited to single items. The liquidation in the stock market has had an effect on the machine tool market in that some companies that had been figuring on buying a little additional equipment have decided to postpone purchases until they can draw more definite conclusions as to the future prospects for business. The recent slowing down in plant operations that has caused curtailment in plants making automobile parts appears to have extended to some plants making airplane parts.

New York, Chicago & St. Louis Railroad Co., Terminal Tower, Cleveland, has plans for one-story car repair shop at local yards, to cost about $60,000 with equipment. A. C. Harvey is chief engineer.

Cleveland Wax Paper Co., 2217 Scranton Road, Cleveland, manufacturer of processed papers, has awarded general contract to S. W. Emerson Co., 1836 Euclid Avenue, for one-story addition, to cost about $50,000 with equipment.

Atlas Steel & Supply Co., 4401 Trumbull Avenue, Cleveland, will soon take bids on general contract for three-story addition to storage and distributing plant, to cost over $65,000 with equipment. W. J. Wefel, 5716 Euclid Avenue, is architect.

Alliance Drop Forge Co., Alliance, Ohio, is considering one-story addition to cost about $50,000 with equipment.

Toledo Scale Co., Monroe and Albion Streets, Toledo, Ohio, has plans for new unit, to cost over $75,000 with equipment. Norman Bel Geddes, 128 East Thirty-seventh Street, New York, is architect.

Dill Mfg. Co., 684 East Eighty-second Street, Cleveland, manufacturer of screw machine products, etc., has awarded general contract to D. C. Hamel Construction Co., Plymouth Building, for plant unit, to cost more than $65,000 with equipment. Roberts-Wright Co., Swetland Building, is architect and engineer.

Fate-Root-Heath Co. (Plymouth Locomotive Works), Plymouth, Ohio, manufacturer of industrial and railroad locomotives, has completed a large new factory unit. Equipment, which is now being installed, will double present output of Plymouth gear-drive gasoline and Diesel locomotives. Company also manufactures gas-electric and Diesel-electric locomotives from 20 to 100 tons.

Sterling Grinding Wheel Co., Tiffin, Ohio, has plant expansion program which will include construction at once of a building with 18,000 sq. ft. of floor space, and another of like size to be started as soon as the first is completed. Company will also purchase new shop equipment. Expenditures will total about $100,000.

Milwaukee

MILWAUKEE, Nov. 11.—While a few machine tool dealers report a falling off in sales and inquiries, manufacturers of machine tools, have not yet felt a recession. Demand is general, with the exception of the automotive industry, a good share coming from small machine shops. Expansion of metal working plants appears to have been unaffected by the collapse in the stock market, and no abandonment of pending programs is reported. A surplus of metal workers in the local labor market is attributed mainly to depression in the automotive lines.

George H. Smith Steel Casting Co., 500 Clinton Street, Milwaukee, will begin construction next spring of a one-story plant on 21-acre tract, recently purchased, to provide for foundry expansion and consolidation of units of Trackson Co., a subsidiary. Trackson Co. manufactures crawler tracks, loaders, bulldozers and cranes for tractor mounting largely marketed through the United Tractor & Equipment Corporation.

Board of School Directors, Milwaukee, has ordered plans from G. E. Wiley, architect, for a four-story addition to Girls' Technical and Trade High School, to cost $350,000. Frank M. Harbach is secretary and business manager of board.

Snap-On Wrench Co., 1270 South Pierce Street, Milwaukee, will start immediate construction of new shop, 200 x 330 ft., and office, 80 x 100 ft., at Kenosha, Wis., to cost $175,000, exclusive of $125,000 which the company will spend for machinery. Frank D. Chase, Inc., 720 North Michigan Avenue, Chicago, engineer, closed bids Nov. 7.

Cary Co., Waupaca, Wis., manufacturer of oil burners, has completed removal of plant and headquarters from Minneapolis, Minn., to Waupaca, following acquisition of Jorgenson Mfg. Co. plant and 20-acre tract, and has completed a hydroelectric plant on Crystal River to supply all power needs.

Indiana

INDIANAPOLIS, Nov. 11.—Leader Specialty Co., 515 East Walnut Street, Indianapolis, manufacturer of plumbing equipment and supplies, has asked bids on general contract for one-story plant, 45 x 112 ft., to cost about $25,000 with equipment. Bacon & Tislow, Architects' & Builders' Building, are architects. Claude J. Mick is general manager.

Inca Mfg. Corporation, Fort Wayne, recently organized to manufacture copper wire products for radio, electric and other service, has work nearing completion on initial unit of new plant, one story, 200 x 300 ft., to cost more than $100,000. George A. Jacobs, formerly president of Dudlo Mfg. Co., with local plant in same line, is president of new organization.

Buhner Fertilizer Co., Seymour, is planning to rebuild fertilizer manufacturing plant destroyed by fire Nov. 4.

Bendix Brake Corporation, South Bend, manufacturer of automobile brakes, etc., has filed plans for three one-story units, 200 x 300 ft., 150 x 220 ft., and 150 x 350 ft., each to cost about $150,000 with equipment. Units will be used as a tool room, screw machine shop, and for storage and distribution.

Midwestern Petroleum Co., Indianapolis, recently organized, will erect new storage and distributing plant at Twenty-first and Yandes Streets, to cost $50,000 with equipment. Other units will be built later. Eugene W. Fields is president, and Charles E. Foreman, secretary and treasurer.

Plant and property of Henry Weis Mfg. Co., Elkhart, manufacturer of steel partitions, crucibles, etc., has been transferred by Henry Weis, founder, and his son, William M. Weis, to a group of seven veteran employees, who will own and operate business in future. Mr. Weis and his son are retiring from active business. Paul W. Kerr, heretofore vice-president, will be president of reorganized company.

Time-O-Stat Controls Co., Elkhart, will soon use 79,000 sq. ft. of additional floor space. Plant, which manufactures heat regulating devices, is a consolidation of several scattered factories. Company states that further additions will be necessary in near future.

Plans for a new airplane factory to be built at Connersville by Corman Aircraft Corporation of Indiana have been announced by Ellis W. Ryan, resident director of company. Plant is to be completed by Feb. 1 and will manufacture tri-motor transport planes. Corman company is owned by Cord Corporation, which also controls Stinson Aircraft Corporation, Wayne, Mich.

W. C. Fletcher Co., Inc., 502 Illinois Building, Indianapolis, has been appointed sales representative for central Indiana by Bradley Washfountain Co., Milwaukee. For southern Indiana and Kentucky, J. F. Shouse & Co., 1197 Stark Building, Louisville, has been placed in charge of Bradley Washfountain sales.

Benjamin H. Rhynearson Co., dealer in new and used machine tools, is occupying a new warehouse at 516 West McCarty Street, Indianapolis, where new and used tools will be carried in stock.

Capitol Stampings Co., 516 West McCarty Street, Indianapolis, a new organization, will engage in manufacture of light stampings, tool and die work. It will be under management of C. R. Swenson, formerly connected with Oakes Mfg. Co. and later Indiana Press & Steel Co.

Gulf States

BIRMINGHAM, Nov. 11.—Contract has been let by Electric Belle Range Co., Huntsville, Ala., to G. A. Rogers, Huntsville, for a two-story addition, 52 x 144 ft., for enameling, to cost about $27,000.

Lufkin Foundry & Machine Co., Lufkin, Tex., has plans for a two-story addition, to cost close to $21,000.

Grayburg Oil Co., San Antonio, Tex., is considering new oil refinery and by-products plant on local site, with steam power plant, machine shop and other units, to cost over $2,000,000 with equipment. A storage and distributing plant will be installed.

Lockhart & Co., Pecos, Tex., operating oil properties in Loving County oil field north of city, have authorized surveys for a new pipe line with terminus at Pecos, to cost about $100,000 with booster stations. It is expected to begin work early in January.

Seaboard Soap Corporation, Hialeah, Fla., is considering rebuilding part of plant recently destroyed by fire with loss reported over $100,000 including equipment.

Curtiss Flying Service, Inc., 27-29 West Fifty-seventh Street, New York, is considering purchase of site at South Jacksonville, Fla., about 1500 x 1800 ft., for airport, to include hangars, repair shops and other field units, as well as facilities for seaplanes, to cost more than $100,000 with equipment.

Border Foundry & Machine Co., Corpus Christi, Tex., has expansion program under way at boat repair plant, including runway for drawing vessels from water, with hoisting, elevating and other equipment. Blucher Engineering Co., Corpus Christi, is engineer.

Under direction of a committee of Oak Cliff-Dallas Commercial Association, Dallas, Tex., plans will soon be drawn for a new vocational school in Oak Cliff district, where 20-acre tract has been secured. Project will include shops for mechanical, electrical, automobile mechanics and other trade instruction. Initial units will cost $100,000 with equipment. T. E. Jackson is chairman of committee in charge.

Texas & Pacific Railway Co., Dallas, Tex., plans rebuilding part of ice-manufacturing plant at Fort Worth, Tex., destroyed by fire Nov. 5, with loss reported close to $100,000 with equipment. Plant was in course of construction and was nearing completion; destroyed unit was designed primarily for refrigerator car service. Entire project will represent investment of $250,000.

City Council, Austin, Tex., is planning fund of about $85,000 for establishment of municipal airport, including hangars, repair shops and other field units. Following completion, airport will be leased to Southern Air Transport, Inc., Fort Worth National Bank Building, Fort Worth, Tex.

Swift & Co., Union Stock Yards, Chicago, have acquired a 10-acre tract at Montgomery, Ala., for new plant, including refrigerating and cold storage department, to cost more than $250,000 with

equipment. Latter will include elevating, conveying and other mechanical-handling facilities.

Interstate Natural Gas Co., Natchez, Miss., is planning new pipe line from Natchez to Woodville, Miss., to cost more than $750,000 with compressor stations and other equipment.

St. Louis

ST. LOUIS, Nov. 11.—Western Supplies Co., 2129 Pine Street, St. Louis, manufacturer of shoemaking machinery, parts, etc., has awarded general contract to F. F. Meckfessel Construction Co., 6625 Delmar Boulevard, for one and two-story plant, 100 x 325 ft., to cost about $35,000 with equipment. Julius Tarling, 2806 North Grand Boulevard, is architect.

Specialty Tool Corporation, Oklahoma City, Okla., has filed plans for a one-story machine shop, 35 x 100 ft., to cost about $21,000 with equipment.

Missouri-Pacific Railroad Co., Railway Exchange Building, St. Louis, has awarded general contract to T. H. Johnson, 107 Ohio Street, Sedalia, Mo., for one-story spring shop at Sedalia yards, to cost more than $40,000 with equipment. E. A. Hadley is chief engineer.

City Council, Ellis, Kan., has authorized construction of new municipal electric light and power plant to replace present unit, including installation of additional equipment, to cost $70,000. E. R. Gibson is city clerk.

Muskogee Iron Works, Inc., Muskogee, Okla., has plans for a one-story machine shop, 25 x 160 ft., to cost about $25,000 with equipment. H. H. Niemann, Barnes Building, is architect. Company will also build two-story office, 40 x 105 ft., on adjoining site.

Guardian Aircraft Corporation, 2504 Texas Avenue, St. Louis, has awarded general contract to Bell Brothers, Inc., Moberly, Mo., for aviation school at Moberly, including one-story aircraft repair and reconditioning shop, to cost over $60,000 with equipment. Ludwig Abt, Reigle Building, St. Louis, is architect.

Carter-Waters Co., 2049 Main Street, Kansas City, Mo., road-building materials and supplies, has plans for a four-story storage and distributing plant, 75 x 100 ft., including road oil and asphalt distributing division, to cost about $70,000 with equipment. Archer & Gloyd, Pioneer Building, are architects.

Red Bird Aircraft Co., Hiawatha, Kan., is considering one-story airplane manufacturing plant, with parts and assembling departments, to cost about $30,000 with equipment.

Board of Education, Crawford, Neb., has authorized installation of manual training department in new three-story and basement high school to cost about $130,000, for which bids are being asked on general contract. Meginnis & Schaumberg, Federal Trust Building, Lincoln, Neb., are architects.

Public Service Co. of Oklahoma, Tulsa, has plans for addition to steam-operated electric power plant at Weleetka, Okla., to cost more than $800,000 with equipment. Company will also build transmission lines in different parts of State, to cost over $200,000.

DeCamp Consolidated Glass Casket Co., Muskogee, Okla., is building two-story and basement addition, 75 x 150 ft., to cost close to $45,000 with equipment. H. H. Niemann, Barnes Building, is architect.

Cincinnati

CINCINNATI, Nov. 11.—Demand for machine tools so far this month has been fairly good, much better, in fact, than was anticipated following the stock market collapse and the slackening of activity in the automobile industry. No let up in production schedules has been reported, and machine tool manufacturers in this district indicate that the present high rate of operations will continue well into next year. Inquiry, generally, is good, with a noticeable increase in requests for quotations from Canada. An automobile manufacturer placed an order with a local maker for five new crankshaft lathes and for rebuilding 15 others.

It is reported that further inquiries are pending from the Russian Government for machine tools; these are expected to be closed in the near future.

City Council, City Hall, Cincinnati, has awarded general contract to William Miller & Son, 1952 Central Parkway, for hangar at Lunken airport, with reconditioning and repair shop facilities, to cost $100,000 with equipment. Truckemeyer & Strong, St. Paul Building, are architects.

Estate Stove Co., Hamilton, Ohio, has filed plans for one-story addition, including extensions in power plant, to cost about $60,000 with equipment. Carl J. Kiefer, Schmidt Building, Cincinnati, is engineer.

City Council, Nicholasville, Ky., is contemplating extensions in municipal electric light and power plant, including installation of additional equipment.

Allen Mfg. Co., Tenth Avenue, North, Nashville, Tenn., manufacturer of stoves, ranges, etc., has awarded general contract to Roberts Construction Co., Birmingham, for grading, foundations, etc., for new plant at Franklin, Tenn., and to Nashville Bridge Co., Nashville, for steel frame superstructure. Unit will have about 150,000 sq. ft. floor space and will cost $200,000 with equipment. Robert & Co., Bona Allen Building, Atlanta, Ga., are architects and engineers.

D. X. Murphy, Louisville Trust Building, Louisville, architect, has plans for three-story automobile service, repair and garage building, to cost about $120,000 with equipment.

Coca-Cola Bottling Co., Memphis, Tenn., has filed plans for one and two-story plant, to include installation of elevating, conveying and other mechanical-handling equipment, to cost about $35,000. H. E. Brooks, 63 South Third Street, is architect and engineer.

Conway Clutch Co. is moving its plant to larger quarters at 1543 Queen City Avenue, Cincinnati.

Pacific Coast

SAN FRANCISCO, Nov. 7.—Aircraft Industries, Ltd., 935 East Fourteenth Street, Oakland, has awarded general contract to George Beard, 726 Tenth Street, Modesto, Cal., for new airplane parts manufacturing and assembling plant at Modesto, to cost $65,000 with equipment. H. S. Thorpe is one of heads of company in charge.

Fresno-Madera Ice Co., Fresno, Cal., is considering one-story ice-manufacturing plant at Stockton, Cal., to cost about $80,000 with machinery.

Link Belt, Meese & Gottfried Co., 3100 Nineteenth Street, San Francisco, manufacturer of elevating, conveying and other transmission equipment, has engaged Austin Co. of California, Russ Building, to prepare plans for new plant group, to cost about $400,000 with equipment.

Botchford Steel Co., San Francisco, recently organized, has taken over plant and business of Judson Mfg. Co., Emeryville, Cal., manufacturer of steel products, including castings, etc., and will operate in future. Plans are under way for expansion and installation of additional equipment.

Arizona Edison Co., Phoenix, Ariz., is considering construction of ice-manufacturing plant at Coolidge, Ariz., with all equipment electrically operated, to cost about $100,000.

St. Paul-Tacoma Lumber Co., Tacoma, Wash., is planning mill at Bellingham, Wash., consisting of three-story units for shingle mill, planing mill and saw mill, to cost about $200,000 with equipment. All machinery will be electrically operated.

Northwest Terminals, Inc., Seattle, has plans for first unit of new oil storage and distributing plant on Harbor Island, to cost about $300,000 with equipment. A similar unit will be built at Linton, Wash., to cost about $200,000 with equipment.

Firestone Tire & Rubber Co., Akron, Ohio, has awarded general contract to Clinton Campbell, 90 West Moreland Street, Phoenix, Ariz., for a factory branch, service and distributing plant at Phoenix, to cost about $150,000 with equipment.

Martinez Junior High School District, Martinez, Cal., plans installation of manual training shop at new junior high school group to cost about $250,000, for which plans are being completed by W. H. Weeks, Hunter-Dulin Building, San Francisco, architect.

H. H. Knowles, Pacific Coast representative of Reading Chain & Block Corporation, Reading, Pa., has announced appointment of Murry Jacobs Co., 554 South Pedro Street, Los Angeles, to represent Reading Chain & Block Corporation in southern California.

W. A. Jones Foundry & Machine Co., Chicago, has moved its Los Angeles office to 342 Towne Avenue. Warren C. Webb is Pacific Coast sales manager.

Canada

TORONTO, Nov. 11.—The slowing down of automobile production has materially affected machine tool sales in this territory. At present the smaller shops are responsible for the bulk of new business, with the call principally for single tools. Used and rebuilt tools are quite active. Although there has been a falling off in demand recently, business as a whole is fairly good. Small tools have also been affected by the decline in the automotive industry. Sales of mining machinery are holding at a good level.

Sackville Shops, Ltd., recently formed, has purchased plant and business of G. E. Bilton Furniture Co., 27 Sackville Place, Toronto. It is understood that some improvements will be made, including installation of new equipment. Col. W. R. Patterson is manager of new company.

Bids will be called soon for erection of a $70,000 addition to plant of the Hoyt Metal Co., 721 Eastern Avenue, Toronto. Company's own engineer is in charge.

Additional contracts have been awarded for erection of a $200,000 plant addition for McKinnon Industries, Ltd., St. Catharines, Ont. Construction is under way, but equipment has not yet been purchased.

Smelting & Refining Co., Ltd., Smith's Falls, Ont., has let contract to D. Dignan, Russell Street, for alterations and improvements to plant.

Bids are being received by Frank T. Adams, engineer, City Hall, Brantford, Ont., for two or three Diesel engine units, two of 450 to 500 hp. each, or three of 300 to 350 hp. each. Motor-driven pumps with capacity of four to six million gal. each also will be purchased. W. S. and R. S. Lea, 1226 University Avenue, Montreal, are consulting engineers.

Bids are being received, no closing date, by Alward & Gilles, architects, Market Square, St. John, N. B., for a $10,000 factory addition to Brantford Carritte Co., Ltd., Coldbrook Street, manufacturer of builders' paper, etc.

A number of contracts have been awarded for an airplane manufacturing plant at Longueuil, Que., to cost $300,000, for Fairchild Aircraft, Ltd., 1253 McGill College Avenue, Montreal, St. George & Gauvreau, Ltd., 4820-4th Avenue, Rosemount, Que., have general contract.

Western Canada

Powell River Co., Ltd., Vancouver, B. C., is receiving bids and will continue into December to award contracts for a $6,000,000 power development plant on Lois River, 14 miles south of town of Powell River, to develop 18,000 hp. Company also proposes to build a second paper mill on Powell River site. A. E. McMaster is general manager.

Foreign

PROPERTY near Havana, Cuba, has been acquired by Atlas Portland Cement Co., 25 Broadway, New York, as site for new mill, with power house and other mechanical buildings, to cost over $1,000,000 with equipment.

Societe des Produits Chimiques de Saint-Cobain, Paris, France, manufacturer of sulphuric acid, etc., is reported planning construction of new plant near La Bessee, France, to cost more than $3,500,000 with equipment.

Swedish Cellulose Co., Stockholm, Sweden, recently formed as subsidiary of Kreuger & Toll Co. (Aktiebolaget Kreuger & Toll), Stockholm, to acquire wood pulp companies with mills in northern part of Sweden, has purchased Sundsvalls Cellulose Co., with mill in same district, having rated capacity of 35,000 tons a year. Extensions and betterments are planned. Plans are under way for new centralized sulphite pulp mill to develop capacity of 100,000 tons of finished material a year, to cost more than $2,500,000 with equipment. Hammorsfornes Water Power Co., another subsidiary of parent company noted, operating hydroelectric generating plants of 85,000 hp. capacity, is considering expansion for additional hydroelectric power facilities for pulp mills. Ivar Kreuger is head.

Southern Cities Utilities Co., 1612 Market Street, Philadelphia, operating electric light and power properties, has purchased properties of Compagnie D'Eclairage Electrique, operating two generating plants and systems at Port-au-Prince and Cape Haitien, Republic of Haiti, and will consolidate properties. Plans are under way for expansion in generating plants and transmission facilities.

The Week's News Quickly Told

Current Events That Bear on the Course of Business

STOCKS sold under heavy pressure, the composite average of 100 leading issues declining 11 points during shortened trading sessions. Bonds also were active and gradually increased in price. Extra dividends were declared by a number of industrial corporations, banks and insurance companies.

* * * * *

FAILURES last week numbered 402 as compared with 414 the preceding week. An investment trust, Banker's Capital Corporation, which showed large earnings from bank stocks in 1927 and 1928, was unable to meet its pressing obligations. . . . A proposed merger of big New York banks has been abandoned because so many stockholders elected to receive cash for their holdings at a price agreed upon before the recent decline.

* * * * *

TRADE and industry are going forward generally in volume about equal to this date last year. Retail trade has not been affected much by the stock market's decline, but wholesale and jobbing trade is on a "small order, prompt shipment" basis. October was a banner month for mail order and chain stores. To quote Julius Rosenwald, of Sears, Roebuck & Co.: "I do not say that future business is going to be good, but it should be."

* * * * *

COMMODITIES continue to decline; Fisher's index is down from 93.7 to 93.3. Grains, live stock, cotton, sugar, coffee and rubber all registered sizeable decreases in price. . . . A leading carpet maker (M. J. Whittall Associates) has reduced prices on Wilton rugs $10 to $15 on the 9 x 12 size.

* * * * *

RADIO prices have been reduced from $15 to $60 by four of the leading manufacturers to aid dealers in disposing of large accumulations of unsold sets. Manufacturing schedules are sharply reduced. . . . Radio Corporation of America, which earned $7.50 per share during nine months in 1928, reports $1.30 for the corresponding period this year, based on additional stock of Victor Talking Machine Co.

* * * * *

LUMBERING, both hard wood and soft wood, is producing at about 10 per cent higher rate than new orders are coming in. . . . While forest products are less active in the Pacific Northwest, all factories in Washington are employing 5000 more men than the peak figures, registered in 1928.

* * * * *

PETROLEUM production has decreased slightly. In one California field, where operators have agreed to curtail production 30 per cent, the price of crude oil has been advanced 50c. per barrel. . . . A similar curtailment in other California fields, matching that achieved in Kansas and Oklahoma, will balance production against consumption for the first time in years, according to E. B. Reeser, president American Petroleum Institute. . . . Oil held in storage tanks now totals 700,000,000 barrels, almost half of which is fuel oil (which is selling at prices lower than the equivalent in coal). Remainder equals four months' production of crude.

* * * * *

SAVINGS deposits and depositors decreased for the first time in 20 years. On June 29, 1929, total deposits were $195,000,000 less than on June 29, 1928. (During the preceding year the increase was $2,250,000,000.) Deposits of individuals, both time and demand, shrunk even more during the last fiscal year, despite an increase of $500,000,000 in the total amount of currency in circulation. . .

* * * * *

GYROSCOPIC control of rudders, elevators and ailerons, proved successful in long test flights across the Allegheny mountains in fog. . . . Construction of giant dirigible for the Navy commenced at Akron. . . . A 40-passenger Junkers land plane of the "all wing" type, powered with four self-starting engines, flew for 30 min. in Germany. Dr. Claude Dornier said that an airplane can be built to carry 100 tons useful load as soon as engine designers can produce the necessary power plant. . . . Army air corps, which had authorized a five-year developmental program, but for which appropriations have been lagging, is awarded a full fifth of the total in next year's budget. . . . Annual deficit of the air mail is about $5,000,000. Postmaster General says the air mail should not be used promiscuously, but be regarded as a special service for business men. . . . In the last 12 months 82 aviation companies have offered $250,000,000 par value of new securities. . . . Daniel Guggenheim Fund for the promotion of aeronautics, having spent $2,500,000 in three years, will go out of existence on New Year's, since various institutes and universities are now equipped to carry on its research and development work.

* * * * *

BARGE canal across New York should not be deepened to 14 ft., in the opinion of a board of Army engineers, because the present facilities can handle twice as much as the existing tonnage, and traffic conditions will soon be altered by improvements to the Welland Canal and the Hudson River. . . . Completion of the Dixie Highway, from Sault Ste. Marie, Mich., to Miami, Fla., started in 1915, was celebrated by opening a hard surfaced road from Chattanooga, Tenn., to Atlanta, Ga. . . . Pennroad Corporation, allied to the Pennsylvania Railroad, bought stock control of Pittsburgh & West Virginia Railway, a line claimed by two rival rail consolidations.

THE IRON AGE

New York, November 21, 1929

ESTABLISHED 1855 VOL. 124, No. 21

White Metal Used in Architecture

Modern Edifices Show Extensive Use of White, Corrosion-Resisting Metals for Exterior Decoration

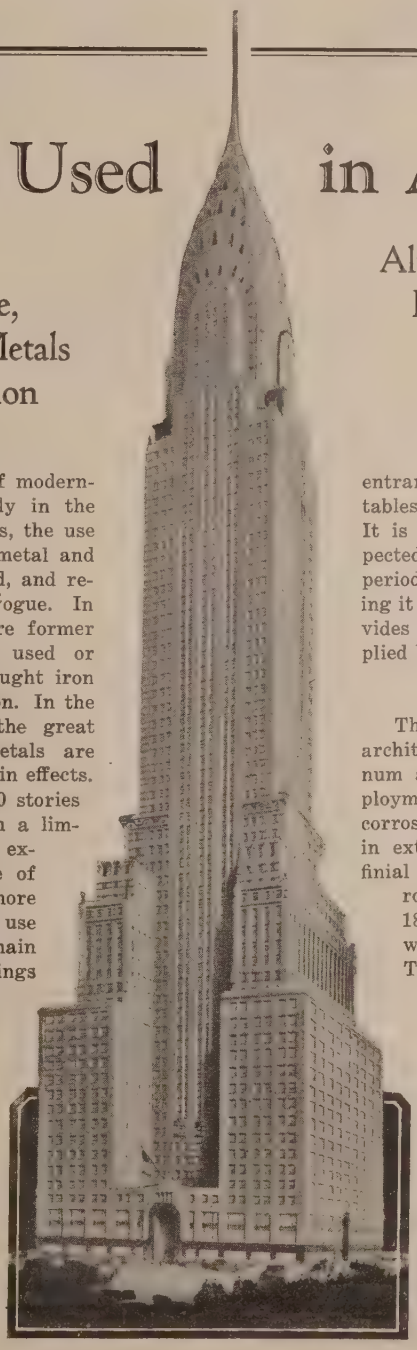
Aluminum Alloys and Rustless Iron Provide for Easy Fabrication

BY GEORGE S. HERRICK*

WITH the rapid development of modernism in architecture, especially in the design of large office buildings, the use of iron, copper, bronze, brass, monel metal and aluminum and its alloys has increased, and recently rustless iron has come into vogue. In residences and public buildings, where former periods of architecture are widely used or adapted to modern requirements, wrought iron and bronze are still used for decoration. In the modernist buildings, however, and the great skyscrapers in particular, white metals are popular with architects to obtain certain effects. As these structures rise from 40 to 60 stories and more above the street level, even a limited decorative use of metal on the exterior requires a substantial tonnage of material worth from 25c. to 60c. and more a pound. In addition to the exterior use of metals on the upper stories, the main entrances and lobbies of modern buildings are usually luxuriously decorated, and when the modernistic style is used, white metal often predominates, sometimes in combination with bronze, brass or wrought iron and at other times without contrasts.

Use of Monel Metal

Monel metal is used in small quantities, but because of its weight and price it has not been extensively specified, except in the case of the Pennsylvania Terminal in New York, where about 150,000 lb. of No. 22 gage monel metal sheets were used for the roof. Recently monel metal was used for interior metal decoration in the Union Trust Building, Detroit, a total of about 60,000 lb. being required for the grill of the main entrance, frames of tellers' windows, and for tables, elevator doors and minor decorations. It is effective as a white metal and is expected to retain its white appearance with periodic cleaning. On the exterior of a building it corrodes to a lustrous green, which provides a protective coating and is usually applied by architects with this end in view.



ABOUT 55,000 Sq. Ft. of Krupp-Nirosta Sheets Will Sheath the Tower of the Chrysler Building and More Will Be Used in Store Fronts and Decorative Features

Aluminum Widely Popular

The leading white metal in use today by architects of modernist buildings is aluminum and its alloys, two factors in its employment being lightness and resistance to corrosion. An instance of its extensive use in exterior decoration is on the tower and finial of the St. Louis Civil Courthouse. The roof is pyramidal, fabricated from No. 18 gage aluminum sheets of No. 3S alloy, which contains 1.25 per cent manganese. There are 11 steps and the base measures 92 ft. x 119 ft. 6 in. Each of the steps is 3 ft. 6 in. high and 3 ft. 9 in. wide. This sheathing required about 40,000 lb. of alloy. On the apex are two cast aluminum sphinxes resting upon cast facia. Both figures and facia were cast in sand from No. 43 alloy, which contains 5 per cent silicon. Each of the sphinxes measures 12 ft. x 12 ft. x 20 ft., but has a wall thickness of only ½ in. These, with the facia, required about 15,000 lb. of alloy.

New Building Has 42-Foot Wings

Another building, on which there is a considerable use of aluminum for exterior decoration, is being constructed for the Genesee Valley Trust Co., Rochester, N. Y., Voorhees, Gmelin & Walker, New York, architects. As a deco-

*THE IRON AGE, New York.

rative finial, the architects have specified four wings, 42 ft. high and 14 ft. wide by 4 ft. 6 in. in thickness at the widest flare of the wings. They taper to about 6 in. at the tips, which are 256 ft. 6 in. above the level of the first, or street, floor of the building. Set separately, the wings leave a circle in the center 10 ft. in diameter.

The wings are fabricated from No. 10 gage, No. 3S aluminum alloy sheets and are braced with extruded angles on the inside, which are of No. 17 ST alloy. A total of about 13,000 lb. of aluminum alloy will be used in this finial. In addition, the building is decorated with 125 spandrels, cast from No. 43 aluminum alloy, which are 4 ft. x 5 ft. and with a wall thickness of ¼ in. The total weight of the spandrels alone is between 12,000 and 15,000 lb. Exterior grill work, which is of No. 43 alloy, will require 5000 to 8000 lb. of No. 43 alloy.

Koppers Building Has 926 Alloy Spandrels

Aluminum alloy has come into extensive use for spandrels on buildings and in the Koppers Building, Pittsburgh, 926 spandrels, measuring 5 ft. square and ¼ in. thick, were used. The average weight of each spandrel was 115 lb., so there is a total of 106,590 lb. of alloy. The alloy is No. 43, an aluminum-silicon combination with 5 per cent silicon. After casting, the spandrels were deplated, a process similar to anodic treatment of aluminum, which gives various shades of gray. In the Koppers Building a leaden shade was used.

Development of rustless iron and its easy working properties has provided a new white metal as a contender with aluminum for architectural use, especially on the exterior of buildings. It has been used in small quantities for store fronts and minor decorative purposes, and some months ago was adopted for the construction of a pedestrian bridge over the street between the Chicago *Daily News* building and the building of the Chicago & North Western Railroad, as illustrated in THE IRON AGE of July 18. The exterior of the bridge, which is entirely of Alleghany metal, required 10,000 lb. all told. In addition, rustless iron was used throughout the kitchens of the cafeteria and restaurants in both buildings. Recently a modernist room was decorated in the Metropolitan Museum of Art, New York, and rustless iron sheets, highly polished, were used on the ceiling and walls, the ceiling sheets being corrugated.

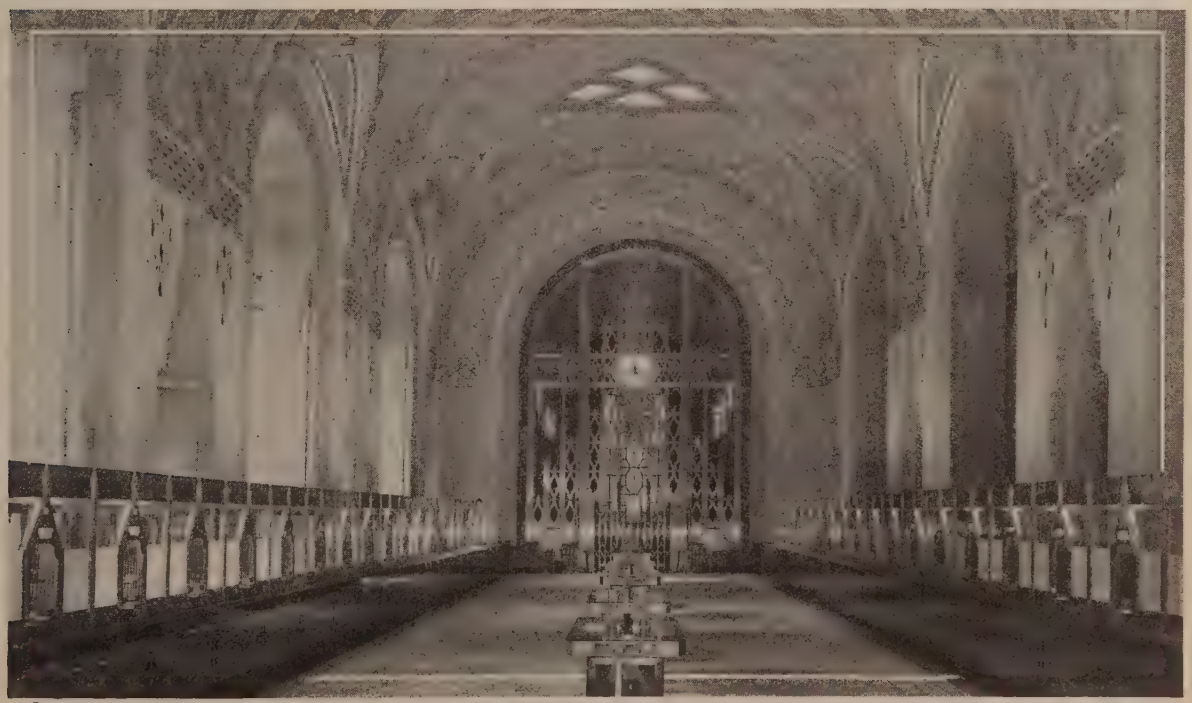
AN Aluminum Pyramid Surmounted by Two Sphinxes Is the Effect of the Roof of the St. Louis Civil Court House, Which Required 15,000 Lb. of No. 43 Aluminum Alloy. Inset shows the steps forming the pyramidal roof being sheathed with aluminum alloy

Rustless Iron Becoming a Factor

Although rustless iron has been used for some time in small and medium sized quantities for architectural decoration, especially store fronts, it was not until the exterior decorative metal for the Chrysler Building in New York was decided upon that this alloy was used as the principal feature of a large building's exterior. Tests of various metals were made by the Chrysler organization

in Detroit before a decision was reached and, with the inaccessibility of a considerable portion of the exterior in mind, a metal with the greatest resistance to corrosion was considered necessary, as cleaning will be practically impossible after completion of the building. Aluminum alloy was considered and aluminum alloy spandrels are already in place between the floors of the first set-back.

Contracts for other decorative features of the exterior are being awarded and a considerable portion of the material thus far decided upon will be Nirosta, to be furnished by the Crucible Steel Co. of America, Ludlum Steel Co. and Central Alloy Steel Co., three of the licensees under the Krupp-Nirosta patents. When completed, the tower of the building will be roofed with about 55,000 sq. ft. of No. 24 gage Nirosta sheets, and rustless iron is also planned for decorative features, which include 24 hub caps, four radiator caps with the Chrysler wings, eight gargoyles and seven pineapple urns. An estimate of the size of these decorations is possible from the fact that the urns are 7 ft. 6 in. high and 3 ft. in diameter. While 24-gage sheets are to be used on the roof, No. 14 gage sheets will be used on the store fronts, window frames, moldings and other trim on the street and first and second stories. For the first two stories above the street, about 50,000 lb. of Nirosta will be used in the form of sheets, strips and casement window sections. Rustless iron for the grillwork of the main entrance and lobby is being considered. As a desirable decoration to balance the extensive use of this material on the tower, it is planned to install etched and enameled, rustless iron elevator doors in the lobby.



IN the Large Screen, Which Fills the Archway of the Lobby, in Counter Screens and Desks in the Union Trust Co., Detroit, 60,000 Lb. of ⅛ to ¼-In. Monel Metal Sheets Were Used with a Cathedral-like Result. Spandrels on the Koppers Building, Pittsburgh, required 106,590 lb. of No. 43 aluminum alloy, deplated to obtain a leaden gray shade (above)

Railing of Malleable Iron Castings on the Lincoln Avenue Bridge, Pittsburgh

Making Large Malleable Castings

Field No Longer Restricted to Small Product— Posts and Railings for Large Pittsburgh Bridges Stand Severe Tests

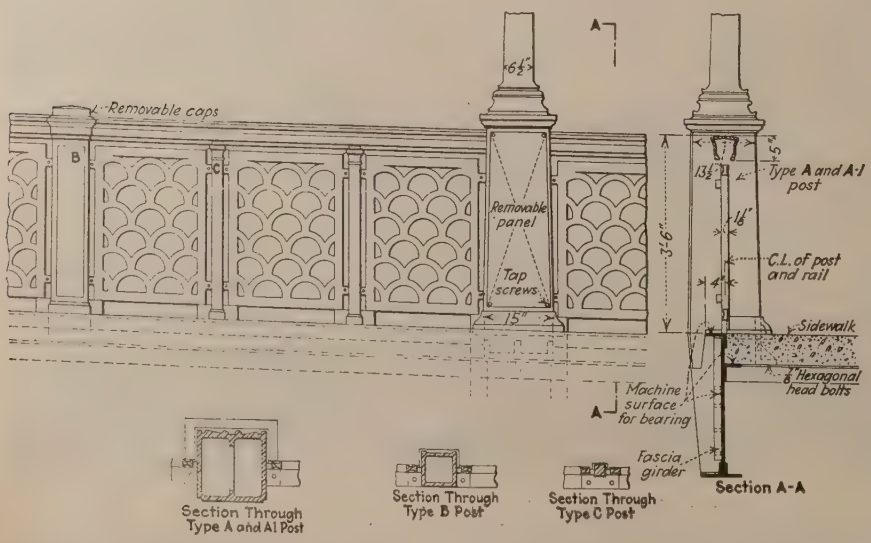
BY EDWIN F. CONE

NO longer is the field for malleable iron restricted to the production of small or medium weight castings. It has been demonstrated on a large scale that castings can now be successfully made of weights and dimensions that heretofore were deemed impossible.

Malleable iron castings have entered a new field. They have been incorporated in the railings for the new Liberty Bridge which spans the Monongahela River in the down town district of Pittsburgh. The production of such castings is regarded as a decided departure from customary practice and has been successfully undertaken by the Fort Pitt Malleable Iron Co. of Pittsburgh. The bridge, in which large malleable iron castings have been incorporated, connects Forbes Street and the Boulevard of the Allies on the north side of the Monongahela River with the new Liberty tubes on the south side.

Built of steel, the bridge is 2663 ft. long, exclusive of approaches. It rises to the height of 125 ft. above the channel of the river. It is, therefore, evident that for a bridge of this size the hand rails should not only be large, to harmonize with the general appearance of the structure, but also have sufficient strength to afford adequate protection to vehicles passing over the bridge. The engineers after careful consideration selected malleable iron as entirely suited to the requirements. It is claimed that this is the first use of this metal for bridge railing in the Pittsburgh district, and probably in the country.

From information furnished by F. W. Groh, engineer of steel inspection, Allegheny Department of Public Works, Pittsburgh, the specification requirements for malleable iron castings on this undertaking called for a tensile strength of 50,000 lb. per sq. in. with an elongation of 10 per cent. The Fort Pitt company had no trouble in meeting these specifications, and takes pride in exhibiting physical tests on a large number of heats which are rather remarkable for their uniformity. The actual physical results of the material incor-



Details of the Railing and Posts of Malleable Iron Castings in the Liberty Bridge at Pittsburgh

porated in the posts and railings approximated 59,000 lb. per sq. in. with a yield point of close to 39,000 lb. per sq. in. The elongation in 2 in. was about 25.5 per cent, with a reduction of area practically the same.

Impact tests upon the malleable iron showed some interesting results. They were made on cast wedges, ½ x 1 in. at the base, and tapered down to what was practically a knife edge, over a length of 6 in. The method of making the test was to clamp the base of the wedge in a vise, holding it in a vertical position while a weight was repeatedly dropped upon it, which produced a blow of about 70-ft. lb. The result was that the wedge curled in the form of a scroll in almost every case and an average of 33 blows was obtained in these tests. No fracture was detected in the wedges. Both tensile and impact tests were made on every heat which was incorporated in the castings for this bridge.

To determine the impact which some of the castings would withstand, other tests were made on various parts of the railing. The type of casting used and the general dimensions is shown in one of the illustrations. Another illustration represents the testing of a malleable iron post used in the railing. The test consisted in dropping a weight of 2750 lb. a distance of approximately 15 ft. as shown. In another illustration engineers of Allegheny County, who supervised the installation of the railings, are shown measuring deflections on these posts after the weight had been dropped. In still another illustration, an engineer is measuring the deflections of a section of the railing after it had been bent under the ram of a 50-ton Lucas press. After these tests, none of the castings showed any sign of fracture.

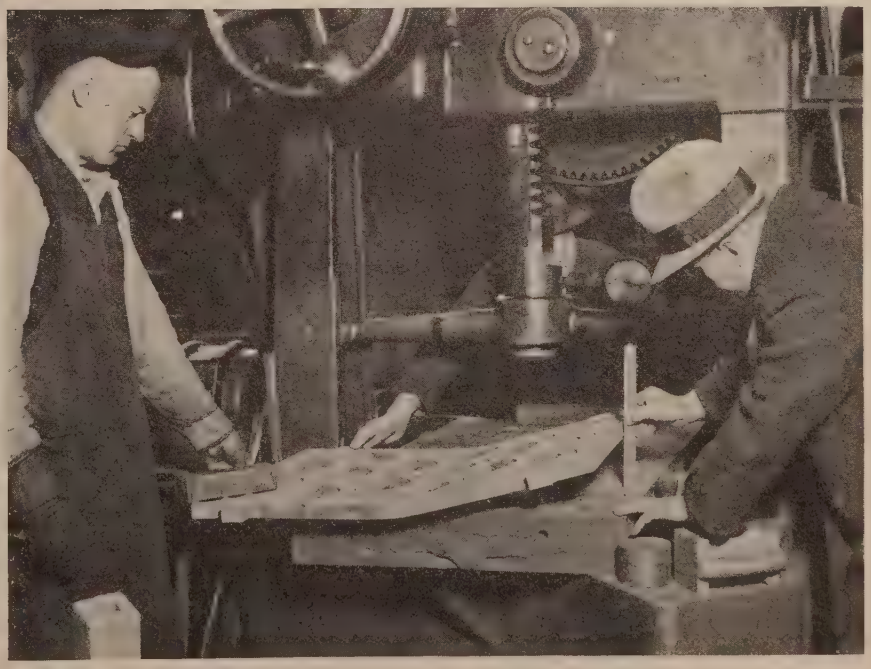
The castings are described as highly suitable from an ornamental viewpoint and it is stated that the engineers are satisfied with the excellent physical qualities and the severe impacts which the castings have withstood in all the tests. Highway and guide rails of the Ramsay and similar types have been installed at numerous places and have proved satisfactory and efficient in service. Among other installations than the Liberty Bridge, the castings recently placed on the Lincoln Avenue Bridge in the East Liberty section of Pittsburgh may be cited.

Some rather striking examples of the utility of these castings have come to light as the result of automobile

TESTING the Impact Strength of One of the Malleable Iron Posts by Dropping a 2750-lb. Weight from a Height of 15 Ft. (Above)

MEASURING the Deflection in One of the Posts After the Drop Test (At Right)

DETERMINING the Deflection in a Section of One of the Railings After Bending It Under a 50-Ton Press (Below)



accidents. A touring car with the full number of passengers was crossing the Lincoln Bridge at a speed in excess of 50 miles an hour and in some manner jumped the curb and collided with the railing. A special tee part construction of this railing, located at the height of the hub cap of the car, bore the brunt of the impact and so straightened out the car that it proceeded on its way under full control. Upon investigation and check-up of the panel which withstood the collision, it was found that the metal had been deflected only 17/32 inch.

A similar accident occurred on the Liberty Bridge. In this case the car was practically ruined, but the railing suffered little or no damage. In another accident on the Liberty Bridge a large car, full of people, jumped the curbing and ran into a railing with sufficient force to bend it about 14 in., totally wrecking the car with no injury to the passengers.

It is felt by people interested in the future of malleable iron castings that a new field has been opened up whereby this material can find extensive use in large castings instead of being confined, as in the past, to small ones.

About 800,000 Rails Tested Electrically for Flaws

CONSIDERABLE success has been attained in the non-destructive internal testing of steel rails for the detection of flaws, particularly transverse fissures. This was brought out in a paper on non-destructive testing presented at the annual meeting of the American Society for Steel Treating at Cleveland, during the National Metal Congress in September. The paper was written by Elmer A. Sperry, president, Sperry Development Co., Inc., Buffalo, N. Y., and read by H. C. Drake of that company. The method was described in THE IRON AGE, Nov. 15, 1928, in an abstract of a paper presented by Mr. Sperry before the American Iron and Steel Institute.

Direct current of high amperage is passed through the specimen and any minute crack or inclusion produces a deviation in the axis of current flow. This deviation is detected and amplified to a value suitable for operating recording equipment. The equipment used for testing consists of a standard track maintenance trailer car carrying a power plant, radio apparatus and recording mechanism. This car is operated at a speed of 5 miles per hr., being hauled by a separate motor car.

Contact brushes go on the top surface of the rail and between these the current flows. Small potential brushes or equivalent searching equipment pick up the difference in potential. The microvoltage is carried to a set of four radio tubes. A paint spraying device is provided, a relay controlling the release of the spray of paint against the side of the rail whenever a defect is found. Fissures are indicated on the friction driven moving strip of paper.

Two detector cars have made permanent records of about 800,000 rails showing the condition of their internal structure and the paper stated that hundreds of transverse fissures have been accurately located and the rails removed from the track. Although the detection of transverse fissures was the primary object of the test cars, the paper stated that they are also locating compound and horizontal fissures, piped rails, split heads and other discontinuities in the rail head. From the data obtained it was found that the number of fissures per mile varies widely, the minimum being about 0.2 and the maximum 3.1 per mile. The device, it was stated, has been successfully adapted to the inspection of a great variety of parts such as new rails at mills, bars, car axles, boiler plate and welded joints.

Not a Cure-All for Transverse Fissures

E. W. Carruthers, Pennsylvania Railroad, Altoona, Pa., said that in a test of over 14,000 rails 21 were removed because of indications of interior defects. Drop tests, in a laboratory, on rails which the detector indicated had transverse fissures, showed that the detector was not always accurate. In his opinion the detector, in its present state of development, cannot be called highly successful, although he said the method is promising and its results are encouraging. He pointed out that there are various factors in actual operation which prevent the detector from working as satisfactorily in the field as in the laboratory.

Results of his experiences in detecting rail flaws with the apparatus were given by W. C. Barnes, engineer of tests of the rail committee of the American Railway Engineering Association. He said that a detector car had been operated continuously under his supervision since last fall. During eight months 1800 miles of rails were tested on 17 railroads and 145 transverse and compound internal fissures were located in addition to other defects. In the opinion of his committee, defects that develop into transverse fissures under service stresses exist in rails when received from the mill. The original defect is so small that only a very sensitive form of the Sperry method could locate it. He hoped that the apparatus would be used for testing rails at the rail mills. Many fissures, he said, are being removed by the use of the Sperry tester, probably all that are immediately dangerous, but he said it is not yet possible with the device to detect minor fissures which will later develop into menaces.

Mr. Drake in closing the discussion said that the criticism made by Mr. Carruthers was based on observations from the use of the first detector car. Since this one was placed in operation some changes have been made, resulting in an improvement in the efficiency of the testing method.

Iron Oxide in Steel Higher Than Supposed

During the past three years numerous writers and investigators have attempted to estimate the amount of iron oxide in open-hearth steel by calculation and by analysis. Experimental work conducted by the members of the metallurgical section of the Pittsburgh Experiment Station of the United States Bureau of Mines, in cooperation with Carnegie Institute of Technology and the Metallurgical Advisory Board, has shown that the amount of iron oxide dissolved in liquid steel in the open-hearth is very much higher than had been thought heretofore.

Apparently, reaction between carbon and oxygen is slow enough so that the metal is essentially saturated with iron oxide with respect to the slag under a rather wide range of conditions in the open-hearth furnace. This fact changes the concept of methods of working open-hearth heats to a considerable extent in that it emphasizes the importance of chemical composition and physical properties of the slag and the necessity for an even more careful study of deoxidizers than has been carried out up to the present time.

An Appraisal of Carbide Tools

Discovery of Tungsten Carbide, Method of Manufacturing Carbide Tools, Representative Performance in Various Uses, and Future Influence

BY DR. ZAY JEFFRIES*

THE base metal of cemented tungsten carbide is tungsten. The hard component is tungsten carbide. It has long been known that ferrotungsten containing large percentages of carbon is excessively hard and also very brittle. About 1898, Moissan produced in the electric furnace a material from tungsten oxide and carbon which he described as a carbide of tungsten. There were no very accurate methods for determining hardness in those days, but the hardness was sufficient to attract Moissan's attention.

About 1904 Just and Hanamann of Budapest, Austria, invented the squirted, or pressed, filament of tungsten for incandescent lamps. They produced, in one stage, tungsten containing a small amount of carbon. Such filaments were so brittle and fragile that it seemed doubtful whether they could become commercial. In fact, as little as 0.10 to 0.25 per cent carbon in such filaments rendered them not only brittle, hot and cold, but so fragile that a large percentage were broken at the touch.

Tungsten Carbide Itself Is Extremely Brittle

Tungsten filaments, therefore, engaged in a battle against carbon from about 1904 until the present time. Even now, at times, carbonaceous material gets into the lamp and a little tungsten carbide forms at the grain boundaries near where the tungsten filament is joined to the leading-in wires. The filament then becomes so fragile that a slight jar on the lamp breaks it and destroys the lamp.

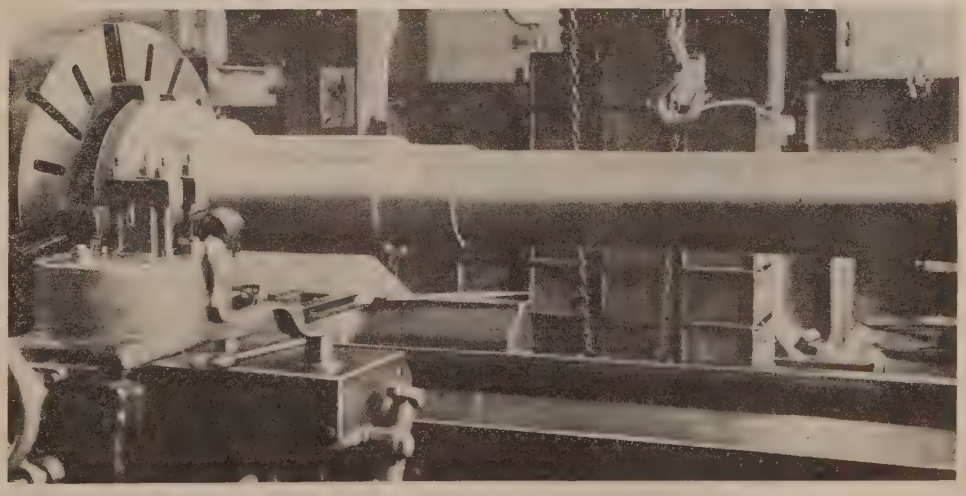
In another process of treating tungsten wire, the filament is heated to a temperature of around 1200 deg. C., usually in an atmosphere of hydrogen. It was early learned that if any hydrocarbon were present (such as by introducing a little kerosene, alcohol or fuel gas), within one second the filament became so brittle and fragile that it could be broken to pieces in the fingers. This, notwithstanding the fact that the filament before heat treatment had a tensile strength of 600,000 lb. per sq. in., and was quite ductile. The percentage of carbon which produced this effect was so small that at times it was difficult to detect it by chemical analysis.

Massive or fused tungsten carbide has been known since the time of Moissan, or for more than 30 years. It may seem rather strange that a material so fragile as tungsten containing a little carbon could be transformed into the tough cutting tool which does not resemble, in any physical property except hardness, the brittle tungsten carbide which was considered worthless for so many years.

Manufacture of Carbide Tools

Creation of these new tools represents a new metallurgy. The old metallurgy, especially of tools, was essentially one of fusion. The tool was either used in the cast condition, with or without heat treatment, or after forging plus heat treatment. The present cemented tungsten carbide is produced by first manufacturing a very fine powder of tungsten carbide; the fine powder is mixed with metallic cobalt and the mixture is then ground in a ball-mill and the ductile cobalt, as Doctor Hoyt has shown, is smeared over the surface of the microscopic particles of carbide. The mixture is then pressed into any desired shape and size. It may then be partially sintered by heating to a low temperature, after which it can be handled

*Consulting metallurgist, Cleveland. This article is abstracted from an address to the Machine Shop Practice Division of the American Society of Mechanical Engineers, Cleveland, Oct. 1.



IN Turning Nickel - Chromium Billets, Carboloy Tools Have Been Used for Four to Five Hours Without Perceptible Wear

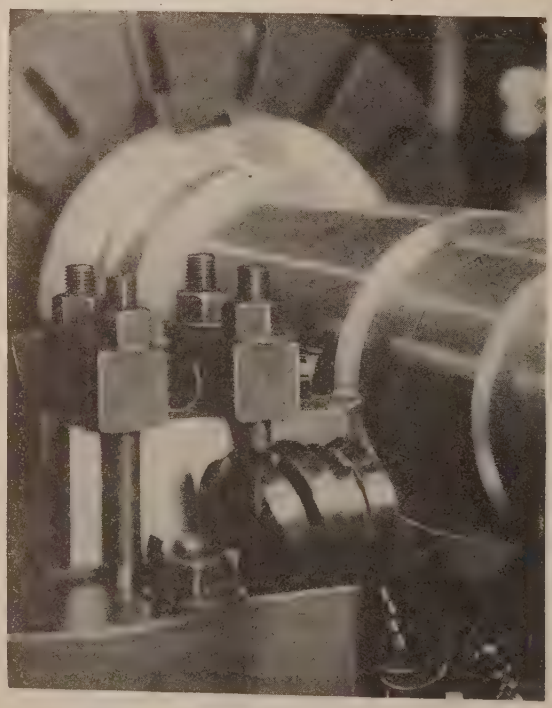
without breaking, but it is not machinable in the sense that the metal can be cut by an ordinary tool. It can be shaped with an ordinary knife or simple steel tool because the partially sintered powder can be removed with ease from the remaining material until the main mass is shaped to the form desired.

This mass of material which is left, after scraping or grinding off what is not wanted, is then reheated to a brilliant white heat in an electric furnace with a hydrogen atmosphere. That is the true cementing operation and the cobalt is the cementing material. The cobalt does not remain pure because it takes up a little of the tungsten carbide in the process, but essentially the finished product consists of minute particles of tungsten carbide cemented together with cobalt or with cobalt containing some tungsten and carbon in solution.

Commercial Development of the Idea

Development took place in Germany by the Osram lamp works of Berlin, and the two men who are given the major credit are Baumhauer and Schroeter. First it was used in dies for drawing tungsten and molybdenum wire at elevated temperatures. Dr. S. L. Hoyt of the research laboratory, General Electric Co., started work several years ago along these lines; he added a number of things to the development, and others have added still different things. Cemented tungsten carbide of today, therefore, represents the work of many people in Germany and in this country as well.

While I am associated with one of the companies manufacturing and selling cemented tungsten carbide in America, namely, the Carboloy Co., Inc., there are three other main channels of manufacture or distribution in the United States. One is Thomas Prosser & Son, who deal with imported cemented tungsten-carbide material made by the Krupp company in Germany. Others are Firth-Sterling Steel Co., which manufactures and sells a similar material under the trade name "Dimondite," and Ludlum Steel Co., dealing in a similar material known as "Strauss metal." I have obtained certain information from them and their opinion of the present status of this industry in America, so that I may present a composite picture. No distinction will be made nor implied as between one brand of cemented tungsten carbide and another.



CLOSE-UP of Rugget Tool and Support for Heavy Cut On Nickel-Chromium Test Log. Speed is 70 ft. per min., twice that expected of high-speed tools

Physical Properties of Cemented Tungsten Carbide

In density cemented tungsten carbide ranges between 14 and 15, a relatively high figure. It is difficult to appraise its true hardness. It has a very high resistance to abrasion. Its resistance to indentation is relatively less than one might expect from this fact. Tungsten carbide itself has a hardness comparable to sapphire or corundum. Scratch hardness of the cemented material is equal to the hardness of the hardest constituent, hence is equal to the hardness of tungsten carbide. Indentation is perhaps a little easier due to the presence of cobalt and hence is relatively low. Rockwell hardness measurements on the C scale will not suffice; a smaller load is used, and a special hardness scale has been developed for these carbide materials.

There is perhaps no test for wear quite equal to the service of tools in use, so that the appraisal of that factor is left to the user.

Whereas high-speed steel requires a special heat treatment to develop its hardness and its red hardness, cemented tungsten carbide is fully hard after cooling to room temperature from the high temperature sintering operation. It can be reheated to a very high temperature and cooled either rapidly or slowly, and it is still hard. Its red hardness surpasses that of any other metallic substance used by industry. No one knows just how hard it is at the high temperature, nor at what rate its hardness decreases at very high temperatures. It appears that temperatures ordinarily reached even in severe industrial operations are not high enough to affect materially the hardness at that temperature.

There are several ways of making this material and there are two or three different grades now available to the trade. These grades differ both in composition, in treatment during preparation, and in physical properties as well.

One of the grades contains about 87 per cent of tungsten carbide and 13 per cent of cobalt. It is tough, having a calculated tensile strength (as determined by the transverse test) of 300,000 lb. per sq. in. It has a high compressive strength, one determination being 540,000 lb. per sq. in., the highest of any material which has been measured in our laboratory.

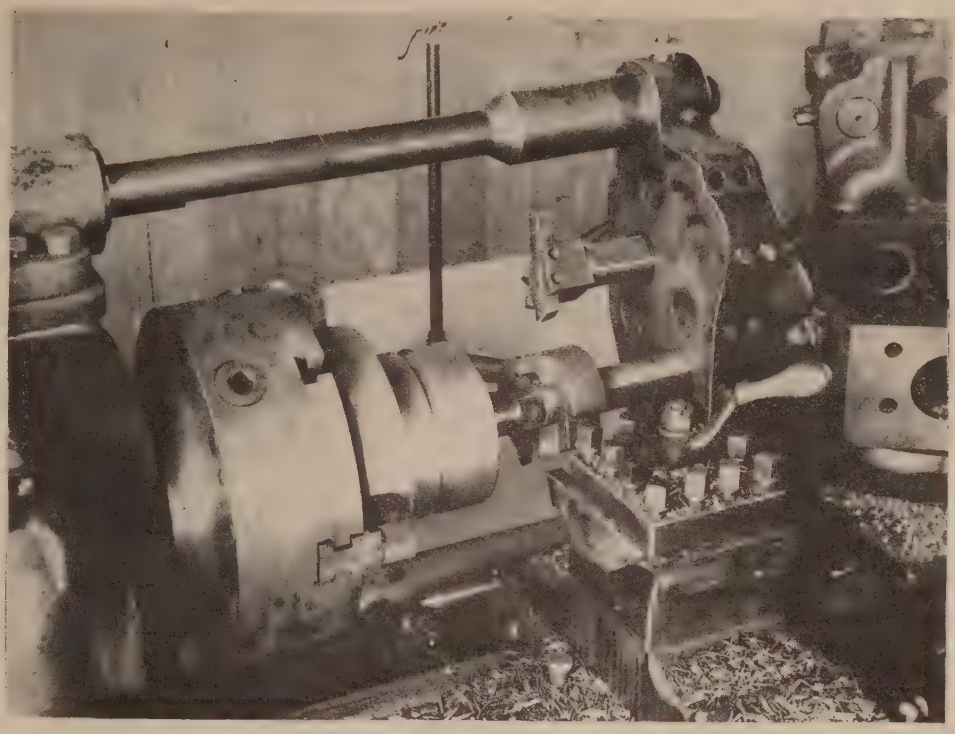
Another grade, containing about 6 per cent of cobalt, is somewhat harder to the indentation test; considerably harder as measured by the abrasion or wear test, and not so strong as measured by the transverse breaking test.

The industry is so new that the multiplication of grades has not reached the public. It is possible, however, by slight changes in composition and in methods of manufacture to produce quite a range of properties, and it seems practically certain that as time goes on the industry itself will select from these possibilities what best suits its own purposes.

High Price Does Not Prevent Savings from Use

Cemented tungsten-carbide material is now offered to the trade at a relatively high price. It is, in round numbers, $450 per lb. It is a price which none of us expect will be maintained; it is now justified by the fact that the industry is in the process of development, and development costs a great deal of money. In spite of the price, we find that the customer uses the material at a distinct saving to himself.

If you are using the tools at a saving to yourselves then, of course, you don't need to have the price come down to effect some saving, and if you are waiting for the



CARBOLOY Tools Set Up for Cast Iron Bushing. Note particularly the boring tool, which has a ½-in. square tool bit. It is operated at an average depth of cut of 7/16-in. by 0.020-in. feed and speed of 179 ft. per min. It made cuts totalling a depth of 5451 ft. without showing sign of wear. Rigidity of mounting is visible in the 4-in. standard cutter head

price to come down before starting the use of the tools, that is your own loss, provided at present prices you can effect a saving. Everyone knows that in the course of time the price of this material will be brought into a range commensurate with the cost of exploitation.

Being a high-priced material, it is utilized by the insertion of a piece of cemented tungsten carbide on a bit of a cheaper material, usually some grade of steel. This has given rise to what is known as the tipping problem. This problem has been taken care of in a number of ways. It may not be all that is desired at the present time, and you can expect improvements in the future. But in most cases it has been entirely satisfactory to put the cemented tungsten-carbide tips on steel shanks by copper brazing in an atmosphere of hydrogen.

There seems to be a preference for the welded tip for larger tools. Welding is attended by the hazard of cracking the cemented tungsten carbide itself, but when properly manipulated this hazard can be overcome.

Both the welded-on tips and the brazed tips have given satisfactory service. An insufficient number of people are conversant with the art of tipping, however, to insure that individual pieces can be distributed haphazard and anything like success can be achieved in the attempts to braze or tip these pieces to steel shanks in the users' tool rooms. On the other hand, some shops have tackled this problem and are in a position to mount their own tools. If a concern has only a little of the tipping to do it is probably best to permit the manufacturer of the tool material to make the tools.

The next problem in connection with the manufacture of a tool is grinding. Several companies in the United States sell suitable grinding wheels. Those which have given the best results familiar to me are artificial abrasives of the silicon-carbide family, such as carborundum or crystolon. A year ago, the matter of grinding these tools was a serious problem, but at the present time it may be said that almost anyone can grind these tools.

It seems to have a tremendous field for wiredrawing dies. Two examples may be cited, one drawing screen wire 0.0108 in. diameter, the other drawing larger wire 0.105 in. diameter. In one field it competes with the diamond die, and in the other with the chilled iron die. In the first case the cemented tungsten-carbide die drew 57,800,000 ft. of 0.0108-in. wire, with a wear of 0.0007 in. In this size the performance was approximately equivalent to that of a diamond die, but its usefulness was not completely exhausted. The overall improvement in cost on a performance basis over the diamond die was 6 to 1.

The second example is drawing the larger steel wire. In a 12-day period, 264 chilled iron dies were used in this duty. Over the same period one cemented tungsten-carbide die performed without "drawing out," i.e., going off size. We had, therefore, one cemented tungsten-carbide die taking the place of 264 chilled iron dies. On a basis of die cost alone, the carbide was cheaper than the chilled iron by a ratio of 36.6 to 18. In addition, more wire was produced during the 12-day period the cemented tungsten-carbide die was in use.

In more specialized service cemented tungsten-carbide dies are being used for hot-drawing fine wires of tungsten and molybdenum, and we will perhaps hear more in the future about its use in hot-drawing other materials.

Tungsten carbide is also used in blanking dies, particularly by the General Electric Co., in punching out transformer disks. It produces a shape free from burrs; after cutting 200,000 parts, the first one and the last one appeared to be just alike.

Cutting on Hard or Abrasive Non-Metallics

It is also used for cutting materials which no other metallic material has been able to cut. In that sense cemented tungsten carbide is opening up a new field for machining. It can machine glass, porcelain and compounds used in the electrical industry such as micalex and ivory. It machines various fibrous non-metallic materials which are abrasive, those containing mixtures of asbestos and other materials used in brake-linings, for example, and molded products of the bakelite type. In some instances it replaces diamond tools, but in other instances it

can machine parts which heretofore could not be shaped economically with any known tool. Just where that will lead in the future no one really knows.

The material is also used to saw rock, replacing saw teeth of other material, so that, outside of the machine tool industry itself, cemented tungsten carbide has potentially a wide application.

A saw with insert teeth, 16 in. diameter, when cutting artificial lumber made of magnesia, asbestos and wood shavings, could be increased in speed from 900 to 1600 r.p.m. The steel saw cut 80 ft. of board between grinds and cemented tungsten carbide 1520; these figures represent a 78 per cent increase in speed, and 1800 per cent increase in footage between grinds.

Ivory is turned at 6000 ft. a minute, hand feed, with only a skin cut, but the result is about the same as that obtained with the diamond tool.

Extraordinary Production on Metal Work

Let me give a few examples of tool replacement when cutting metal. It should be obvious that machines designed to use tools with different physical properties might not be able to take full advantage of this new material. Nevertheless it is interesting to see what performance one actually gets.

For example, when turning armatures, one armature per grind with the best steel tool. With cemented tungsten carbide we get 40 armatures per grind; the speed is 700 ft. a minute, and 1/64-in. cut. In rough and finished turning on commutators, the old record was 150 commutators per grind; with cemented tungsten carbide, 30,000 per grind.

In a cut-off tool, the old performance was 100 cuts per grind; with cemented tungsten carbide, 15,000 per grind.

For an example of profiling 1020 S. A. E. steel at very high speed, take the old practice of 60 pieces between grinds and compare with cemented tungsten carbide, 25,000 pieces.

When boring a main transmission bearing in cast iron, 4½-in. diameter, 100 to 125 pieces could be produced per grind with the old tools; 950 with cemented tungsten carbide.

An interesting thing developed when finish boring bronze bushings to a tolerance of 0.0005 in. The old record with existing tools was 150 pieces per grind, and 7000 with carbide. In addition to this economy, there were only 5 per cent as many pieces rejected as was usual with the older tools. That is a very significant point, namely, that in machining to close tolerances the longer the life of the tool the less will be the machine scrap, because the more nearly the piece will be machined to a dimension within the tolerances.

When reaming a malleable iron differential carrier with 3¾-in. hole, it is cut at 70 ft. a minute with 1/64-in. cut and hand fed. With the old tools there were one or two adjustments per day, and with cemented tungsten carbide one tool has been running for eleven weeks without change.

A high-silicon alloy of aluminum, useful for gas engine pistons, can be machined only with the greatest difficulty with the ordinary tools; after about ten pistons the tools are too dull for use. With the new tools some of the operations will run 300 to 500 between grinds, and on other operations as many as 2500. Over three years ago Doctor Hoyt brought one of his new tools to Cleveland where we had been trying to machine pistons of somewhat similar composition to this with the ordinary tools and had given it up. The cemented tungsten-carbide tool proved so satisfactory that we waited for a couple of years before putting this type of alloy on the market, waiting, that is, for a commercial supply of satisfactory tools with which to finish it.

Another example (not a machine tool but a nozzle for a sand blast): The performance, compared with the chilled iron nozzle, is on the ratio of 120 to 1.

I could go on naming such examples for some time, but the order of results already quoted is now obtainable with existing tools and machine tool equipment.

There are some other features in connection with these results which have not been mentioned. In nearly every case, without change of labor, the production of the entire plant has been increased by carbide tools. It is seldom that the improvement is not 15 per cent, and sometimes the actual production has been more than doubled.

Tools for Intermittent or Jump Cuts

The art of making tungsten-carbide tools to stand up better under intermittent cuts is improving daily. Whereas a few months ago an attempt to use cemented tungsten carbide on a certain job resulted in failure, today some of those same jobs yield to the improved art. There may be some improvement in the material itself, but that is secondary as compared with the improvement in the mounting. It has been found that this material with relatively low tensile strength as compared with high-speed steel has a higher compressive strength, and it is essential to utilize the material in compression, and to develop as much rigidity in the whole tool mounting as possible. Those improvements represented mostly increase in rigidity, obtained by increasing the size of the shank, by increasing the size of the piece of cemented tungsten carbide itself, and by so mounting the piece in the shank as to receive a maximum of support in portions which ordinarily would be in tension in the tool.

This matter of rigidity has been carried to the extreme in a type of tool where the cemented tungsten-carbide insert is surrounded and reinforced on all sides (where it would normally be in tension) in a plain steel shank. Such a tool is capable of performing intermittent cuts and otherwise behaves much like one would expect of a very rugged tool.

Published literature and experience emphasize that the angles of these tools are very important. The top side rake angle is usually four degrees less than for high-speed steel for the same job, and also the side and front angles should be relatively low, usually between four and six degrees. The tool should also be set very near to center in order to reduce the tensile stresses, and to reduce chattering as far as possible.

Rapid Developments in the Art

Fifteen months ago one tool was sold to a large manufacturer in the United States, and that tool is still working. In the meantime it has replaced 2450 lb. of the type of tool material which was being used previously. That is the record so far.

But broadly speaking, about one year ago the whole country became conscious that there was such a material as cemented tungsten carbide. Naturally, the machine tool builders had to make some tests of their own to warrant expenditures for machines to develop the properties of cemented tungsten carbide.

To the keener observer, one who is familiar with the horsepower of motors which have been mounted on machine tools in the past, the machine tool congress now in session in Cleveland suggests quite a revolution. We have some records of performance of carbide tools on machines which have been designed to utilize fully the inherent characteristics of the material. One of the workers in that field asserts that the true results will probably not be believed by a good share of the readers.

When cemented tungsten carbide was given a good deal of publicity about a year ago, there was a clamor for tools, and for months the imported material and the material made in this country were not sufficient in quantity, or could not be made into tools rapidly enough, to fill this

demand. The first orders were naturally trial orders, and no great amount of business came from any one source. The expense of trying to serve that sort of a demand, of course, was tremendous, and also it put quite a tax on the organizations. But since the middle of this summer the companies promoting this material have been in a position to supply tools and tool bits on short delivery for most of the ordinary tool requirements. There are a number of desired tools which it has not been found practical or expedient to make at the present time, such as very large-sized dies for drawing tubing, but that demand will be taken care of in the not distant future.

The advent of high-speed steel was a great thing, not only for the steel industry, but for all industry; it was a great thing for mankind. It has played a major role in what we might call our economic civilization, and it has done perhaps more than any other one development in the last 25 years to help make men economically independent, to help make the expenditure of a given amount of human energy produce more of the necessities and luxuries of life.

Its advent, however, did not reduce the amount of carbon steel tools used. There are apparently being made every year more carbon steel tools than were made in the year 1905, the year when high-speed steel began to get into production. In the same way we don't anticipate that cemented tungsten carbide, even though it be sold very much more cheaply than it is today, will eliminate high-speed steel or carbon steel tools. I strongly suspect that in 1935 there will be as much or more high-speed steel made per year as in 1929, and this is a big year.

Furthermore, we do not regard this material as a cure-all for everything in the tool industry. Some applications have met with very indifferent success; some attempted applications can be branded at the present time as absolute failures. We do not know where this material will lead us, especially from the standpoint of tool substitutions. It seem, however, that we have gone far enough so that we can definitely say that cemented tungsten carbide or its approximate equivalent is destined not only to have a definite place in the future of industry, but a most important place. That it will be used in large quantities and for a great variety of purposes in the future there can be no question.

One of the results is going to be to carry the economies initiated by high-speed steel and stellite toward greater economic benefits for mankind. It seems reasonable to expect that the material can increase the average production in machine shops by 20 per cent, or will make possible the production in five days what now takes six. If that is true it cannot help but benefit all of the people, because machined goods will cost less, and it will benefit the metal industries because more metal can be used.

Treatment with Chemicals Improves Metal-Sprayed Surfaces

PROBLEMS pertaining to metal spraying were discussed by a group of interested persons meeting in Brussels early in the year, according to the Swiss *Welding Journal*. Zinc spraying is now strongly competing with galvanizing. Thriving plants spraying up to 60 tons of metal per week exist in Holland, Belgium, France and England. Whereas hot galvanizing practice tends toward minimizing the thickness of the zinc coat, spraying puts on from 0.10 to 0.18 lb. per sq. ft.

Rapid formation of a protective skin of zinc oxide on a sprayed coating is of great importance. Treating with sodium chloride speeds up the formation of this layer and produces zinc coatings which resist the action of sea water and air extraordinarily well.

Since, in the metal spraying process, a liquefied metal wire is atomized into fine particles by a compressed air jet, it is not to be expected that the deposited metal will form a homogeneous mass. Even if the particles should hit the surface in a completely liquid state, instead of in a plastic state, it would not only be impossible to hold the molten metal together on account of the compressed air jet, but the liquid metal would flow down vertical surfaces during the application. The alternative is to fill the sprayed coatings by chemical or mechanical means. Nature performs this task for zinc; oxide and carbonate are formed which close up all pores of the coated layer. This natural protective layer either does not occur or is insufficient in coatings of other metals such as aluminum, tin, copper and lead. Painting with all sorts of preparations has been unsatisfactory, as they were too easily dissolved or worn off.

Far better results are had when the metal layer is treated with certain chemicals which react with the metal. Durable aluminum coatings are produced, for instance, by treating the layer with acids and carbonates. Containers for breweries, sugar refineries and laundries have been so treated and have stood up well in service.

Spraying with aluminum as a protection against high temperature has given divergent results. One German plant preheats the steel to a red heat before spraying with aluminum; a French concern heats the object after coating with aluminum and after a treatment with borax and soda to about 930 deg. Fahr. In England aluminum coatings are applied to iron or steel specially alloyed for this purpose.

Spraying with tin has also given more satisfactory results when subsequent chemical treatments have been applied. Tin coatings treated with acids and silicates are very satisfactory for food and oil containers and for vessels and machines used in oleomargarine manufacture, baking ovens and cooking utensils. In Belgium tank cars for shipping acids have been sprayed with lead inside and zinc outside.

Larger Stock Lines Require Larger Charges

It is a matter of common knowledge that, in a pile of unsized material, the larger pieces roll to the outside due to their greater inertia. This is not the whole explanation of size segregation in the blast furnace. The difference in the angles of repose of ore and coke is an important item in stock distribution with respect to size. Observations made by the North Central Experiment Station of the United States Bureau of Mines, in cooperation with the University of Minnesota, Minneapolis, indicate that the angles of repose of ore and coke in the blast furnace are about 34 and 27.5 deg., respectively.

Calculations based upon these angles indicate that the ore layer is about one ft. thicker at the walls than at the center. Unless the size of the ore charge is increased, the effect of larger stock lines will be to decrease the amount of ore thrown toward the center of the furnace. In order to prevent an unnecessary increase in the porosity of the center of the furnace the size of the charge should be increased in about the same proportion as the stock line area.

No Serious Depression in Sight

Consumption Has Not Exceeded Country's Income and Productive Capacity Has Been Free from Undue Strain—Capital Created No Faster Than Savings

BY DR. CHARLES O. HARDY

DURING the past month one item of news has completely overshadowed every other element in the business situation. Developments which would ordinarily have been regarded as omens of fairer business weather, such as increases of dividends, foreshadowings of tax reduction and declines in money rates, have been interpreted as stock market propaganda rather than as business indexes. On the other hand, unfavorable news, such as declines in car loadings, in prices of basic raw materials and in the level of activity of the steel, automobile and building industries, all have been interpreted in their bearing on the future of the stock market, and on general business activity through the stock market channel of influence.

In view of this concentration of interest it may be worthwhile to recall the relationship of the fluctuations of stock prices and of business activity during the period since the completion of the debacle of 1921. During this eight-year period the trend, both of business and of the stock market, has been more strongly upward than in any previous period of our history. This fact is the more remarkable because the period has been one of very great economic strain for all the other leading nations of the world. Pre-war experience pointed to the conclusion that the prosperity of the leading commercial and industrial nations was interdependent to a much greater extent than appears to have been the case during recent years.

This upward movement of business activity in the United States has been accompanied by a similar upward trend in the level of stock prices, but the relationship of the year-to-year fluctuations of stock prices and of business activity has been less uniform. In 1922 both curves moved strongly upward; both turned down in the latter part of 1923 and in early 1924; then they turned still more sharply upward in the fall of the latter year and through 1925.

¶ Real values are not made in the stock market; they are only registered there.

¶ Prosperity is not made or unmade by errors and correction of errors in the registration.

¶ The pace of business in the last two years has not exceeded country's capacity to produce without overstraining its resources or to consume without overdraft on its income.

¶ Nor has the country been creating capital above its capacity to finance through the current rate of saving.

¶ Decline in business appears to conform to three-year cycle.

¶ A reaction like that of 1927 would not be a catastrophe.

Stock Prices Diverge from Business Trend

But in 1926 the movement of stock prices diverged from that of business. A sharp break in stock prices in the spring was more than made up by the end of the year, whereas productive activity and business profits broke all records. In 1927 the curves again diverged. Most business indexes registered lower levels than in 1926 or in 1925, profits were unsatisfactory, and the unemployment situation occasioned more concern than in any year since 1921. Stock prices, on the other hand, moved upward with only minor reactions through the year.

Stock Market Boom Out of Line With Corporate Income

Since 1927 the two series have coincided in direction but not in slope. The business world has once more enjoyed prosperity. In the spring and early summer of 1929 signs of overproduction appeared in some basic lines, but prices did not reflect inflation. This upswing in business, however, was completely overshadowed by the Wall Street boom. Ever since the summer of 1927 the upward surge of stock prices has been out of all proportion to the increases of corporate income, though the latter have been impressive.

In general it may be said that from 1921 to the summer of 1926 stock prices went up roughly in proportion to the improvement in the actual income of the corporations whose shares were traded in; for the next year the increase of stock prices reflected an increase of dividends rather than of earnings, while for the last two years the upswing of stock prices has represented chiefly a willingness to capitalize industrial earnings at lower and lower rates. By the spring of 1928 the average of a long list of good corporate stocks were selling on a basis which capitalized their dividends at a lower rate than the bonds of companies of similar standing—a phenomenon never seen before.

Suddenness of Crash Due to Lack of "Short" Interest

The decline of the last few weeks has been unparalleled in its suddenness, though not in its extent. The suddenness of the smash may plausibly be explained by the lack of a "short" element. It has long been a commonplace of speculative markets that in a panic the first buyers are those who have already sold at higher prices, and that this sort of buying provides a cushion to break the force of the panic. Price declines which terminate real estate booms are sharper and of shorter duration than stock market liquidations because there are no short sales of real estate. Apparently in the stock market boom of 1929 the persistent upward course of prices in the face of adverse money conditions, official disfavor and the dictates of common sense had substantially driven the short seller out of the field.

Probable reactions of the stock market crisis on economic life are just now being painted in the blackest colors. "Christmas trade will be hard hit, automobile sales for several months will be cut to the minimum, luxury trades will go to pieces, building is already on the downswing, the only ray of light is the hope that stock

prices will resume their upward course." It would be rash indeed to predict that none of these things will materialize. Undoubtedly the effect of the boom is to make thousands of people poorer and to make thousands of others think themselves poorer, and trade will be affected. Nevertheless, it seems safe to surmise that this picture of the situation is overtinged with Wall Street psychology. Real values are not made in the market place; they are only registered there, and prosperity is not made or unmade by errors and corrections of errors in the registration. The losses which the country has suffered on account of the stock market collapse are not comparable with those which it suffered on account of the Mississippi flood or the Southeastern hurricane. The storm and the flood took wealth away from individuals and destroyed it, they did not transfer it to others.

Nevertheless, a stock market collapse does in the short run have some depressing effect on business. It was pointed out in these columns a month ago that a collapse in stock values must result in some improvement in bond values (which would facilitate some types of business and impede others), but that such an improvement can be expected only with a time lag. Precisely the same thing applies to the effect on individual buying power. Those speculators, big and small, who have been wiped out by the collapse of paper values at once go out of the market as buyers of luxuries; those who profit by the fall of prices are not likely to expand their purchases immediately by a corresponding amount. It takes time to show who are the gainers. The purchasers of stocks even at the bottom prices of the recent declines are not yet sure whether they have shown foresight or rashness by refusing to wait still longer.

Business Outlook Not Alarming

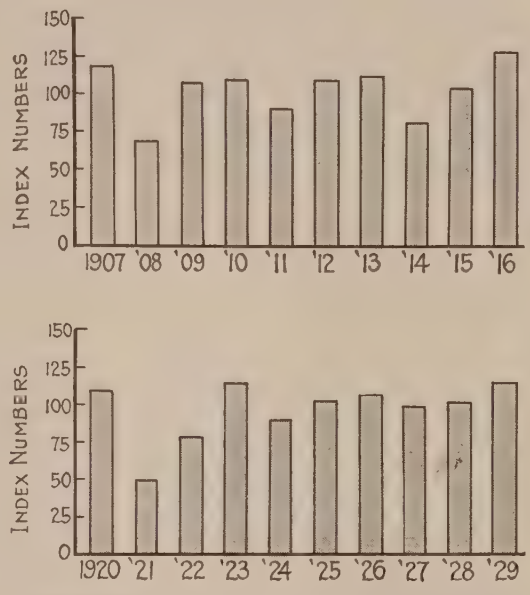
Developments outside the stock market must be regarded as mildly unfavorable, but not alarming. The money market has eased, partly because of the liquidation of stock market obligations, but chiefly because the Federal Reserve System has pumped a large amount of credit into the market in the hopes of allaying the panic. The rediscount rate has been lowered twice at New York and once at London. However, the long continued efforts of the Federal Reserve System to drive capital out of the stock market were of so little avail as to inspire skepticism regarding their probable success in pumping it in again. Industry and trade need new money no worse than they did a month or two ago.

Money rate cuts, dividend increases, bankers' pools, assurances of public officials and prominent business men that "business is fundamentally sound," public announcements that X, Y, and Z are buying stocks, widely advertised supporting orders under the market—all these are part of a propaganda designed to check or stop the downward sweep of stock prices. Such efforts are commendable in so far as they aim to prevent the bottom from dropping out of the market so fast that banks and other lenders cannot protect their loans and customers of brokerage houses cannot get information as to what their holdings are actually worth. They are commendable too in so far as they tend to check the depressing psychological effect of the stock situation on business planning. But in so far as they rest on the assumption that the country is wealthier or in any sense better off with the common stocks of its corporations valued at 30 times earnings, than when valued at 10 times earnings, they are discreditable to the wisdom of the community.

Three-Year Cycle at Work?

Outside the security market the situation is readily summarized. The moderate downward trend noted a month ago continues, and it looks as though 1930 is to fall below the records of 1928 and 1929. There is little evidence that the decline of production in basic lines has been accelerated by the doings in Wall Street, but it has not been checked. Prices of raw materials are weakening, and there is evidence of a slight curtailment of retail demand. Automobiles and building are the weakest spots; the automobile situation will probably be made worse by the stock market's collapse and building, better.

This decline raises the question whether we have developed a normal cycle of two good years and one poor one. Such a cycle appeared in late pre-war years, and since we got out of the war and the post-war boom it seems to have reappeared. The years from 1921 to 1927



THREE-YEAR Cycle of Two Good Years, Followed by One Bad Year, as Illustrated by Pig Iron Production (Index for 1929 Based on Nine Months' Performance)

repeated the sequence of one very bad year followed at three-year intervals by two moderately bad ones, which was established in 1908, 1911, and 1914. The accompanying chart shows how this cycle has appeared in pig iron production; numerous other indexes could be used to show a similar sequence. It is a temptation for the forecaster to predict that such a cycle will continue until it is again interrupted by an unpredictable cataclysm. But this is hypothetical. Perhaps the sequence of two good years and one poor one has a rational basis in the technique of our productive process—and perhaps it is merely a coincidence.

In any case there is no reason as yet to forecast a serious business depression. The pace of business in the last two years has not exceeded the country's capacity to produce without overstraining its resources or to consume without overdraft on its income. Neither has the country been creating capital above its capacity to finance through its current rate of saving. Should we have in 1930 such a recession as occurred in 1927, or even in 1924, it would not be a catastrophe. Most of our industries can earn reasonable profits if two years out of three are good, provided the third is no worse than have been the poorest years since 1921. There is no more reason why such moderate reactions should lead to downward revisions in the value of permanent investments than that mild booms, like those of 1923, 1926 and 1929, should cause those values to be revised upward.

Progressive Conveyor Assembly

Durant Cars Advance without Their Own Wheels Until Nearly Complete—More Rapid Work Gives Production Economies

PRODUCTION economies are provided in an automobile body manufacturing plant recently placed in operation by Durant Motors, Inc., Lansing, Mich. This, adjoining the car assembly department, occupies a new two-story building, the outstanding features of which are good ventilation and the excellent lighting provided by an abundance of continuous window surface.

Bodies are assembled on a conveyor on the first floor and cleaned and painted on the second floor. The wooden frame members made in a Louisville, Ky., mill, are shipped into the plant ready for assembly. This cuts down transportation charges on lumber, a considerable percentage of which becomes scrap in the making of body members.

The body assembly conveyor is approximately 400 ft. long. Near the loading end is a jig in which the sub-assemblies are put together, forming the frame. On removal from the jig, the frame is placed on a truck on which it remains through all the assembly and cleaning and painting operations, until the completed body is ready to be mounted on the chassis. Then the truck returns to the loading end of the body assembly conveyor. Each truck is mounted on four wheels, two running on a flat rail track and two on a channel track.

The wooden sections of the body are fastened together as the frame moves along the conveyor. Drills and screw drivers used in this work are electrically driven, power for these tools being taken from a trolley line directly above the conveyor. The trolley through which the current is supplied to the tools slides along on the trolley wire, permitting moving the tool along the assembly line.

When the frame leaves the jig and goes on the assembly line, the floor boards are the only wooden members that are not in place. The sheet steel panels are put on as the bodies move along the lower part of the line, after the frame assembly. Polishing on the metal sections is done along the line with air-operated polishing wheels.

Assembled bodies on leaving the line are pushed sideways on to an automatic hoist, which carries them to the cleaning and painting department on the floor above. The hoisting requires only one man, who trips the mechanism and pulls truck and body from hoist to upper floor.

Bodies Move Along Three Lines

There are three parallel conveyor lines in the cleaning and painting department. First the body is cleaned with gasoline in a spray booth, then cleaned by hand and wiped and, finally, any spots that may be left are cleaned off with emery paper mounted on wheels. Then the bodies are dried for about 20 min. at a temperature of 250 deg. Fahr.

After drying they are given a priming coat of paint. Then they move to the second conveyor line and through an oven, where the priming coat is baked. File marks and other metal spots are then removed, after which two surface coats are applied. These are dried in an oven in the third line, after which the bodies are rubbed with fine sandpaper. A clean-up operation follows and then the lacquer is applied.

The enameling department is conveniently arranged for cleaning and enameling various parts. There are two Crescent machines for cleaning parts before enameling; one is for small chassis parts and the other for hoods, fenders and aprons. Parts are first washed in an alkali solution, after which they are rinsed in water at near boiling temperature. Then they are dried in an oven at a temperature of approximately 400 deg. Fahr.

On leaving the oven the parts are moved along on a table for various hand cleaning operations. These include sanding to remove rough spots, scratches, etc., cleaning with high-test gasoline, removal, by means of air blowers, of any moisture that may be remaining, wiping inside and out and finally wiping with alcohol. Then they go to the adjoining enameling department, where they are again wiped, this time with tack rags.

There are two enameling ovens, side by side, one electrically heated and the other gas heated, each used for different classes of work. Each oven has thermostatic control. Parts that require the finest finish, such as fenders, aprons, hood sills and gas tank covers, go through an A-type oven. In this they are given two coats of enamel and are drained and baked after each dipping operation. The tunnel-type oven is used for small parts such as trunk racks, wheel carriers and other parts that do not require the finest finish.

Final assembly is done on two main assembly lines. The frame parts are received from the stamping plant and assembled at the side of the final assembly lines. Other parts are stored along these lines at points where they will be needed. The bodies are placed on the line through an opening from the floor above.

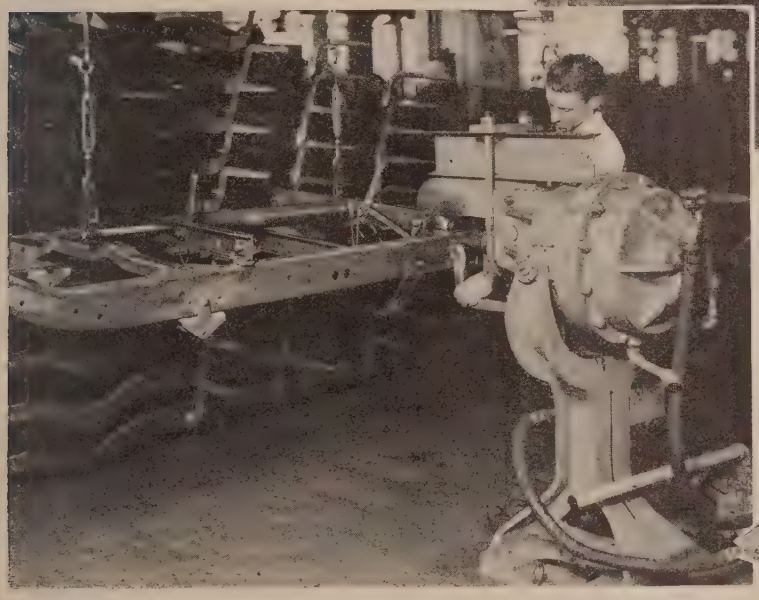
A feature of the assembling is that the wheels are not put on until the car has reached near the end of the line, and until after the body has been put on the chassis and practically all the assembly work has been done. Consequently the chassis, instead of moving on the car wheels, remains attached to the assembly conveyor until the car is about ready to leave the line. It is found that assemblers can do more rapid work in putting on various parts if the wheels are not in their way.

After the springs and axles are assembled to the chassis, the latter is turned over and set on carriers that form a part of the conveyor. Nearly all the remainder of the assembling is done while the chassis is moving on the carriers. All that remain to be assembled after the wheels are mounted are the radiators, head lamps and a few other parts, whose assembly is not interfered with by the wheels.

Each car is tested after assembling, by operating the motor with the rear wheels setting on two heavy cast iron wheels, the faces of which reach slightly above the floor level. The car is held in position by blocks in front of the front wheels and when the motor is started the cast iron wheels revolve with the rear wheels. The energy required to operate both the car in this position and the heavy wheels on which the rear wheels rest is said to be approximately the same as the energy required in a road test. The cast iron wheels are 40 in. in diameter, have an 8-in. face and weigh 850 lb. each. The shaft carrying the two wheels revolves on four groups of roller bearings, one set of bearings on each side of each wheel.

ASSEMBLING Panels and Other Metal Parts on the Body Assembly Conveyor (Right). This moves at a predetermined speed and the work is carried forward at a speed to match

FRAME Sections Are Shipped Knocked Down (Below) and Are Assembled in a Bay Adjoining the Final Assembly Lines. This picture of a riveter at work shows the frame suspended from an overhead carrier



DEPARTING from Usual Practice, Wheels Are Not Put on a Car Until Practically All the Other Parts Are Assembled (Below). Consequently, they are not in the way to interfere with other assembling work

Fabricators Adopt Business Code

Trade Practice Conference Followed by Annual Meeting of American Institute of Steel Construction—Studies Financial Status of the Industry

FABRICATORS of structural steel held a trade practice conference Nov. 11 and 12 at the Edgewater Gulf Hotel, Edgewater Park, Miss., and adopted provisionally, under the chairmanship of Hon. W. E. Humphrey, of the Federal Trade Commission, a code of trade practice. All of the large fabricators, save the largest of them all, were present, and opinion expressed in the succeeding few days was unanimous that the industry in this meeting had taken a long step forward and one which would prove a matter of growing importance as time goes on.

In these following days was held the annual convention of the American Institute of Steel Construction, Inc. The sessions of this body, the seventh annual, were marked, in contrast with previous meetings, by an aggressive rather than a defensive attitude toward the problems of the industry. Reports of the officers were impressive, both with respect to the expansion of the organization in numbers and in activities and with respect to the research work in progress and planned, including the technical side as well as that of markets. There were intimations that the institute could put to good use for hastening research projects an income substantially equal to its present one, or roughly $300,000 a year additional.

Annual Meeting of Steel Constructors

AN outstanding address was made by Alexander Wall of the Robert Morris Associates, Lansdowne, Pa., emphasizing the importance of any one company's determining its true position, financially (and inferentially industrially), in comparison with the industry as a whole. So well received was this address (which is reported in another column), that a committee was ordered appointed to cooperate with Mr. Wall for the further development of the subject.

An inspiring contribution was made by Dr. D. B. Steinman, consulting engineer, New York, who traced with the aid of lantern photographs "fifty years of progress in bridge engineering." He detailed in somewhat popular language the tremendous strides that have been made in the length of span and carrying capacity, particularly in recent years, and also in making utility and beauty more or less synonymous. His views included designs for longer structures than now exist, such as the proposed Liberty Bridge across the Narrows at New York.

One session of the convention was given over to construction matters, with the so-called battledeck floor as a main item. Among other topics were welding, riveting and fireproofing. A demonstration of the steel deck floor featured the conclusion of the session. In a yard at the rear of the hotel a simple frame of steel, supplied from the New Orleans warehouse of the Lukens Steel Co., had been erected to show how the plates of the floor may be arc welded to each other and to the underlying beam. The exhibit also covered the easy application of molded gypsum fireproofing material, made by the Rockwood Corporation of America, St. Louis, for column protection and ceiling construction.

Among papers and addresses of the convention were these: "Industrial Cooperation," by Hon. W. E. Humphrey, Federal Trade Commission, "International Cooperation," by Hon. Vincent Massey, Minister from Canada to Washington, "Woman's Influence on Steel Purchases," by Mrs. Christine Frederick, director, Applecroft Home Experiment Station, Greenlawn, L. I. (these three at the banquet), "Steel Dams, Lock Gates, Caissons, Etc.," by Henry Goldmark, consulting engineer, New York, and an address on the geographical distribution of capacity and bookings of the fabricated steel industry, by L. Seth Schnitman of the Bureau of the Census, Washington. From Tuesday evening, following the trade practice conference of Monday and Tuesday, until late Friday night, when a hilarious get-together dinner, in a hallowe'en atmosphere, was concluded, the attendance of some 290, including ladies, was well occupied with scheduled sessions, allowing only Thursday for a golf tournament.

Growth of Steel Construction Institute

	1924	1929
Income	$30,000	$324,000
Members	114	220
Paid employees	4	50
Office rental, monthly	$225	$1,050
Literature mailed, pieces daily	....	100
Standard handbooks, daily	....	100*
Items of literature on hand for active distribution	....	108
Calls by district engineers, daily	....	45
Mailing list, arch., engr., contrs., etc.	....	3,500
Addresses by representatives	few	70
Sales manual bulletins	....	65
Technical service bulletins, monthly	....	2
Advertising inquiries, daily	....	15

*$55,000 in 18 months.

Officers Were Reelected

The directors whose terms were expiring with the meeting were returned for another three years, and the directors subsequently reelected the officers, as tabulated in another column. Also elsewhere will be found the report of the committee on mill relations. The discussion in this connection included the expression of a wish that the producers of shapes had an organization or that there could be a group of them who could be met by the fabricators in future negotiations, instead of a group approach in each case, as it now is, with a given mill.

Some time was spent in discussing a practice recently established apparently of having one contract, in Federal aid road projects, cover the bridge work as well as the foundations and road work proper. Efforts are to be made, largely through the engineering department of the institute, to reinstate the former separation of the bridge contract from the rest of the work. The investigation is likely to cover also any practice there may be of holding the steel structure of a Federal building project as part of one general contract.

Reports were submitted in printed form, as follows:

Code of Standard Practice, by C. M. Denise, McClintic-Marshall Co., Pittsburgh, chairman.

Fireproofing as Related to Structural

Steel, by E. W. Krueger, Worden-Allen Co., Milwaukee, chairman.

Uniform Method of Cost Accounting, by W. S. Mosher, Mosher Steel & Machinery Co., Dallas, Tex., chairman.

Publicity and Advertising, by George E. J. Pistor, Hay Foundry & Iron Works, New York, chairman.

Standard Handbook, by D. H. Wood, Converse Bridge & Steel Co., Chattanooga, Tenn., chairman.

Artistic Bridge Designs, by Clyde MacCornack, Phoenix Bridge Co., Phoenixville, Pa., chairman.

Wind Bracing and Technical Research, by Aubrey Weymouth.

Committee for Making Complaints

IN another column are enumerated the practices defined as unfair and practices to be condemned, all as compiled by the trade practice conference held prior to the meeting of the American Institute of Steel Construction and independently of it. The conference also voted the appointment of a committee to draft standard proposal and contract forms and it set up a committee on trade practices. This committee is "empowered to investigate and determine whether these resolutions are being observed, to make complaints concerning alleged violations, to cooperate with the Federal Trade Commission, and generally to perform such other acts as may be reasonably necessary and proper to put these resolutions into effect and accomplish the objects and purposes of this conference. The American Institute of Steel Construction, Inc., is empowered by this conference to appoint said committee."

Against Much Change in Anti-Trust Laws

Federal Trade Commissioner Humphrey, at the banquet of the institute, touched on his views respecting repealing or materially amending the anti-trust laws. He believes it best for American business to rely on an ever continuing series of decisions of the Supreme Court, or as he put it, "at last, after the lapse of forty years, lawyers and courts are able to give with reasonable certainty the law applicable to any given state of facts. Is it advisable to again travel this long and burdensome road of discouragement, confusion and business disturbance?

"The Supreme Court by precedent after precedent slowly but steadily and wisely is telling us what they [Sherman law, Federal Trade Commission act, Clayton act] mean. To now adopt a series of new statutes would cast doubt upon the applicability of this long line of judicial decisions. It would again bring upon the business of the country the legislative and judicial chaos from which we have so slowly and painfully emerged. In other words, to repeal or radically amend the anti-trust laws in my opinion would be to largely destroy all we have gained in forty years of experience."

Composite Balance Sheet for a Given Industry

THE burden of Mr. Wall's address was that a bank needs to have more information of a company than shown on the balance sheet; that this is insufficient at times even if the volume of sales and the percentage of profit are available. It is essential, he asserted, to have a composite statement of each industry and then the individual company's statement may be compared with the composite. Such a comparison is valuable not alone to the bank but to the company. Cases are known in which a given company, in the opinion of accountants, appeared to have a favorable ratio of current assets to current liabilities but its position in respect to other items, such as receivables, payables, and the like, was bound to spell receivership, unless discovered and corrected in time.

Mr. Wall had succeeded in getting statements of 54 steel fabricating concerns and presented to the meeting a compilation of the so-called common size statement, reproduced elsewhere in this report. By comparing a given company's showing with this standard for the same year, he would be able to suggest where the company is strong and where it is weak and also could indicate measures which should be taken for improvement. The common size statement, it will be noted, shows for every $100 of assets how much is cash and how much is receivables, etc.

"If we find," said Mr. Wall, "that it is usual in a particular industry for the sales to run to an amount six times the inventory and we find a single unit in that industry whose sales are only four times its inventory, we can be pretty sure that something is out of line in the processes of that single company, in connection with its inventory. It is carrying more merchandise on its books, per dollar of sale, than are its competitors, and it is an expensive matter to carry merchandise in greater quantity than is economically necessary because of the carrying charges."

After the session adjourned, THE IRON AGE asked Mr. Wall for figures which would show roughly where the fabricating industry stands in relation to a number of other industries. A few of the ratios are here tabulated:

Structural Steel Industry Compared with Other Industries

Industries	Current Assets to Current Liabilities	Net Worth to Fixed Assets
Fabricated steel	270	150
Passenger automobiles	340	400
Motor trucks	500	400
Wholesale heavy hardware	340	255
Hardware manufacture	370	625
Machine tools	250	370

The Robert Morris Associates, represented by Mr. Wall, is an association of the credit officers of banks. It was organized in 1915. It has accumulated statements numbering between 7000 and 8000, covering 70 different branches of industry, and it compiles statements of each business

American Institute of Steel Construction, Inc.

OFFICERS

President, Charles N. Fitts, New England Structural Co., Boston.

First vice-president, C. M. Denise, McClintic-Marshall Co., Pittsburgh.

Second vice-president, Clyde MacCornack, Phoenix Bridge Co., Phoenixville, Pa.

Treasurer, George E. J. Pistor, Hay Foundry & Iron Works, New York.

Executive director, Charles F. Abbott.

Chief engineer, Lee H. Miller.

DIRECTORS

*H. B. Hirsh, Belmont Iron Works, Philadelphia.

George E. J. Pistor, Hay Foundry & Iron Works, New York.

J. L. Kimbrough, Indiana Bridge Co., Muncie, Ind.

*L. L. Gadd, Levering & Garrigues Co., New York.

C. M. Denise, McClintic-Marshall Co., Pittsburgh.

W. M. Wood, Mississippi Valley Structural Steel Co., Decatur, Ill.

A. J. Dyer, Nashville Bridge Co., Nashville, Tenn.

*Charles N. Fitts, New England Structural Co., Boston.

Karl E. Vogel, Omaha Steel Works, Omaha.

G. E. Klingelhofer, Pittsburgh Bridge & Iron Works, Pittsburgh.

Reese Llewellyn, Consolidated Steel Corporation, Los Angeles.

*N. W. Warren, Dominion Bridge Co., Ltd., Montreal.

*W. S. Mosher, Mosher Steel & Machinery Co., Dallas, Tex.

*H. A. Fitch, Kansas City Structural Steel Co., Kansas City, Kan.

J. J. Duffin, Duffin Iron Co., Chicago.

Clyde MacCornack, Phoenix Bridge Co., Phoenixville, Pa.

James T. Whitehead, Whitehead & Kales Co., Detroit.

J. E. Miller, Bellefontaine Bridge & Steel Co., Bellefontaine, Ohio.

*Re-elected for another term.

AT the banquet of the American Institute of Steel Construction the chief speaker was Hon. Vincent Massey, minister from Canada to Washington. From left to right: N. W. Warren, Dominion Bridge Co., Ltd., Montreal; Mr. Massey and Charles N. Fitts, president of the institute.

under the various ratios for each year. Statements are submitted to the association on a standard form. The plan serves, he emphasized, to give individual banks the courage and the basis to help clients, through the opportunity to compare a client's status with the composite of his industry. As suggested, from the industrial standpoint, it is calculated to save a company from slipping into a dislocated situation with respect to others in the same industry.

Recommends Several Association Activities

IN his address as president, Charles N. Fitts made some recommendations which were enumerated in THE IRON AGE of Nov. 14, page 1327. Elaborating on them the subjoined extracts give the basis of his suggestions:

The effect of taxation and government revenue in cities and localities where height restrictions are imposed by legislation, the cost of housing in localities where buildings are allowed to take full advantage of construction economies, the question of congestion, (whether the skyscraper is a *cause* or a *result*) are problems that should be analyzed by experts and "the American Institute of Steel Construction is the proper body to initiate the investigation."

The demolition of structures will undoubtedly afford the best of opportunities for discovering the effects of time on the various materials. "To make adequate diagnoses of demolished buildings we would have to enter into an investigation of the condition of all the various materials which entered the structure originally.

Trade Practice Conference on Structural Steel

THE trade practice conference of the structural steel industry, held Nov. 11 and 12, defined the industry to include "any person, firm or corporation herinafter designated the distributer, engaged in manufacturing, selling, distributing or erecting structural steel for construction purposes." Its further definitions were:

A distributer is a mill, a warehouse, a fabricator or an erector, or any or all of them.

For the purpose of these proceedings a mill is a manufacturer of structural materials for construction purposes, which sells to a warehouse or fabricator.

A warehouse is a concern that carries a well selected stock of plain materials, buys in suitable quantities and re-sells to fabricators, erectors and others and assumes the credit risks and such other obligations as are common to such sales.

A fabricator is a concern that maintains a shop for the fabrication of plain materials for construction purposes and assumes the credit risk and such other obligations as are common to such sales.

An erector is one that generally contracts with buyers to furnish and erect structural steel fabricated by himself or others and assumes the credit risk and such other obligations as are common to such sales.

Unfair Practices Enumerated

The resolutions passed by the conference, later to be acted upon by the Federal Trade Commission and segregated into its groups 1 and 2, defined the following as unfair practices:

GROUP 1

To use or to substitute materials inferior in quality to those specified or required by the applicable governmental regulations.

In manufacture and erection, to use methods not in accord with governmental regulations obtaining.

The sale of material below cost to injure a competitor or with the effect of lessening competition.

For steel distributers to sell below cost or beyond usual marketing territory, with the effect of lessening competition. (Dumping.)

The secret payment or allowance or acceptance of rebates, commissions, credits, discounts, or like concessions, in money or other valuable thing, or any secret understandings or agreements to do work or to furnish material on terms other than those set forth in the contract between the parties. (Commercial Bribery.)

Dissemination of information, false or misleading, relative to competitors' products, selling prices, credit standing, ability to perform work, or labor conditions. (Defamation of Character.)

Knowingly to submit a bid after a contract has been awarded to a distributer.

Any discrimination in price between purchasers, whether subsidiaries of the manufacturers or otherwise, in violation of the Clayton Act.

Practices Condemned

As group 2 the following practices are condemned:

To recognize uneconomic or an unsafe structural design. In the matter of regulations of manufacture and erection, in territories where no governmental laws, rules, or regulators as to manufacture and erection of buildings prevail, the conference voted that the standard specifications and code of standard practice of the American Institute of Steel Construction, Inc., shall be used.

When lump sum bidding is impracticable, figuring the final weight in any other way than the accepted practice of the industry as set forth in the standard specifications and code of standard practice of the institute, unless otherwise specifically set forth in the invitation to bidders, is condemned.

Misleading promises of delivery and performance that cannot reasonably be fulfilled.

To submit a bid without having been requested or invited to do so.

To condone reopened bidding, commonly known as "shopping."

THE battledeck floor being pushed by the American Institute of Steel Construction leaves space underneath for carrying piping, with molded fire-proofing, such as gypsum, to enclose the conduits and form the ceiling. The self-propelling electric arc-welding machine, taking the welding rod from a coil mounted on the machine, welds together the edges of two plates and the plates to the supporting beam.

Among those witnessing the welding performance are: (1) C. T. McLoughlin, General Electric Co.; (2) James N. Keenan, engineer at New York for the institute; (3) J. E. Waugh and (4) D. H. Deyoe, welding engineers of the General Electric Co.; (5) F. H. Frankland, technical service department of the institute; (6) Charles N. Fitts, New England Construction Co., president of the institute; (7) Lee H. Miller, chief engineer; (8) George E. J. Pistor, Hay Foundry & Iron Works, New York, treasurer; (9) W. M. Wood, Mississippi Valley Structural Steel Co., Decatur, Ill., a director. According to Chief Engineer Miller, the steel plate flooring structure "will reduce the dead floor load by about one-half and make it possible to add 25 or 30 per cent more stories without increasing foundation loads."

An investigation would disclose answers to some of the economic problems which are constantly presented us in the erection of structures.

"The work if done properly embraces much more than an examination of the structural steel. It covers more facts than would be sought by any one industry. The Bureau of Standards should be empowered to direct the work if not actually to make the investigations for us."

By promotional efforts frequently displayed by local chambers of commerce in their endeavors to extend the industrial importance of their various cities, businesses are invited to construct new plants and to engage in a manufacturing activity in localities that are sometimes more than adequately supplied. "There should exist some adequate means to check such unwarranted enthusiasm."

The collection and dissemination of the necessary statistics "is distinctly the province of the United States

Report on Mill Relations With Steel Constructors

FOLLOWING are the main items of the report of the committee on mill relations of the American Institute of Steel Construction, presented by H. A. Fitch, Kansas City Structural Steel Co., chairman:

The activities of your committee have, during the past year, been confined to the question of financial support on the part of the rolling mills to the institute's program. The treasurer's report shows that the amounts received from the mills during the fiscal year ended Sept. 30 was approximately the same as was contributed during the previous year. This result is, of course, not equal to our hopes or expectations.

We respect the opinion and conclusions of the officials of the various mills, with whom we have conferred during the year. Our interpretation of the attitude of the mills is that they intend to continue and augment their support as the conditions and facts pertaining to our proposed activities may warrant.

Our interests and our problems are so closely related to the interests and problems of the mills—where these problems pertain to structural steel—that almost we are partners. The ultimate attainments hoped for, whether specific or general, are identical.

Let us remember that we may not always know the facts in the case. Business is complex—our organizations are large and extended—the structural steel business is not conducted by fixed rules and instructions. Every transaction has its own complexion. The members of our own organization, who must of necessity be given discretionary powers, do not always reflect our interpretation or judgment in a transaction.

The types of buildings being erected today are not the types that will be common ten years from today. There is going to be a revolution in the types of building construction. These future buildings certainly will be of steel frame. Can this industry sit calmly by and allow other interests, often unfriendly interests, to guide the trend of building development? We must come to a realization that we are builders as well as fabricators, and we must assume the responsibility attendant thereto.

We must know more about structural design, and floor design, and fireproofing, than any other one agency. We must approach this from a scientific and impartial viewpoint. We must obtain and appropriate the necessary funds to develop the scientific facts in a conclusive manner. We must, of necessity, do this collectively. No individual concern is qualified to do this. The work and the results must be done in such a manner as to inspire confidence by the public.

The American Institute of Steel Construction has assumed the responsibility and is sponsor for the structural steel industry. The mills have recognized that the institute is the logical agency for this development, and have confidence in the competency of our organization. As we plan our constructive program and determine our requirements, we have every confidence of the cooperation of the mills to the fullest extent.

Government. We have no means of knowing what the shop capacity is within well defined trading zones, nor has there been established any uniform basis for measuring that capacity. Neither do we know how active the business is in competitive areas. These defects could be easily remedied to the great benefit of the structural steel industry.

"The officials of the Bureau of the Census have shown a decided willingness to accommodate us to the full extent of their ability. In return I recommend that we individually and collectively assist the Bureau of the Census in the compilation of their studies by complying fully with all their requests for information and data."

Semi-Centennial of the Skyscraper

"The American skyscraper has certainly left a deep impress in the industrial, commercial and social life of this country, and is synonymous with American business supremacy. It has been an agency of greatest importance to the structural steel industry, so much so, in fact, that we should be the sponsors and the leaders in a proper celebration of its inception.

"Possibly no better means could be devised than an engineering and architectural exhibit to be held in Chicago in 1934 coincident with an international conference on skyscraper building."

Mr. Fitts, at the outset of his address, expressed satisfaction that while a recession in the sale of steel in general began in August, bookings of structural steel continued to gain. The fact, he said, means that "we have begun at last to demonstrate the true merits of structural steel. Our cooperative campaign is at last convincing those responsible for important structures that if strength and security are to be achieved this material must be specified."

Expansion of the Institute

THE report of Charles F. Abbott, executive director of the institute, whose headquarters are 200 Madison Avenue, New York, was presented in the form of a 70-page illustrated pamphlet. It was a convincing document on the notable expansion made by the association in its short period of existence. Elsewhere are enumerated some items illustrative of the institute's development.

In addition it appears that 217 cities have adopted in whole or in substance the standard specification making for economies in design, that wider use is now made of the institute's code of standard practice, that numerous foreign countries have commended favorably the standard handbook. The institute now has eleven district engineers, one having been added to the staff, with headquarters in Dallas. Mr. Abbott asks for five more for a needed reallocation of districts. He describes how sales representatives of member companies have been drafted into the service of the national organization. The institute's bureau of engineering service, advertising and advertising returns, the use of the standard sign on buildings in course of erection, and educational literature came in for special consideration.

The steel plate floor construction, which Mr. Abbott mentions as demonstrating the possibilities of applied research, offers according to estimates a potential market that would consume plates to a greater tonnage than that going for railroad cars and shipbuilding combined. The use of steel in dam construction, he adds, is another undeveloped opportunity awaiting a similar effort. Considerable work has already been accomplished and the possibilities have been well charted. Much also has been accomplished in establishing the merits of steel in hangar construction in connection with the development of airports.

Needs of the Institute

From the last section of Mr. Abbott's report the following has been taken:

The institute should engage in a more extended activity—additional field engineers, more enlarged advertising and other extensions are advisable in order that the present momentum may be fully sustained. It should not be handicapped when its record entitles it to enlarged support. It should grow with the demands being made upon it for service. It should not be forced into a position incapable of meeting a natural growth. The present organization should be kept together, which is possible only when ambition can become satisfied with future prospects.

The individual concern, no matter how large, has found itself totally unable to cope with the new struggle for markets. The forces that can be marshalled against it are too great. The battle line is too far flung. The ability to understand that the individual concern can prosper only as

Distribution of Fabricated Steel Capacity and Bookings in 1928

THE accompanying tables were presented to the Steel Constructors' meeting by L. Seth Schnitman, United States Bureau of the Census. In 1909, he said, fabricators with monthly plant capacity of 2500 tons or over had 65 per cent of the total capacity of the industry; in 1925, 58 per cent; in 1929, 60 per cent. Plants with capacities of 500 to 2499 tons represented in 1909, 25 per cent of the total capacity, in 1925 and 1929, 32 per cent. Plants with capacities of less than 500 tons have only once since 1909 reached a ratio of 11 per cent, in 1923; it now stands at its lowest point of the entire period, at about 8 per cent. Fifty-one per cent of the number of structural plants have capacities of 500 tons or more and together these firms have 92 per cent of the entire capacity of the industry.

The Western division has for its Eastern boundary the north and south line of States of New Mexico to Montana. The Southwestern comprises Texas, Oklahoma, Arkansas and Louisiana. The Southern lies east of the Mississippi and south of the Ohio.

Distribution in Each Section by Size of Plant

	Under 500 Tons		500-2499 Tons		2500 Tons and Over	
	Capacity	Bookings	Capacity	Bookings	Capacity	Bookings

the industry prospers offers the sole hope of survival.

The institute has the support of all elements of the industry, the approbation of the public, the confidence of the architect, the engineer, the contractor and the public official.

Discussion on Welding and Riveting

IN the session devoted to construction matters, progress in electric welding was discussed by Dr. F. P. McKibben, of the General Electric Co., and J. C. Lincoln, president, Lincoln Electric Co., Cleveland. Dr. McKibben exhibited lantern photographs showing details of the work done on the General Electric building in West Philadelphia, the Chalfonte Hotel at Atlantic City and a General Electric building at Pittsfield, Mass. He said that 58 towns and cities now allow structural welding. He opposed a present move to require licensing of welders, partly on the ground that it leaves workmen more or less under the undue supervision of municipal boards. Some 40,000,000 lb. of steel are welded annually, he added. His lantern slides also included some automatic welding of steel pipe 48 in. in diameter for a 7-mile line.

Mr. Lincoln devoted himself in large part in speaking for the carbon arc as against the metallic arc. He also showed machine welding; this applied to a 60-mile line of 66-in. pipe of ⅜-in. and ⅝-in. steel for Oakland, Cal. He regarded his machine as well adapted for erecting the steel deck floor. He placed considerable emphasis on the use of welding as being the best single method of promoting an increased use of steel.

R. W. Boggs, Union Carbide Co., New York, touched briefly on the gas welding of a building for the company at Niagara Falls, N. Y., described at the time of its completion in THE IRON AGE.

What A. F. Jensen, president Hanna Engineering Works, Chicago, had to say on riveting is reviewed elsewhere in this issue.

What Is Happening in Structural Riveting

Speed With Easy Handling—Portable Yoke Riveters, Alloy Rivets and Cold Riveting Likely

BY A. F. JENSEN*

A CONSUMPTION of more than 35 million rivets per month conveys some idea of the rivet's important place in the structural steel industry. The first yoke riveters, built about 1865, were steam actuated, the hydraulic riveter following in 1873. A patent covering a pneumatic riveting hammer was issued two years later, to be followed by the plain toggle yoke riveter in 1877 and by the toggle lever pneumatic yoke riveter in 1903.

Today we see portable pneumatic riveters driving 700 ¾-in. rivets an hour in small columns and giant portable pneumatic riveters weighing 30 tons driving 1¼-in. rivets, 6¾ in. long, in hydroelectric penstocks and spiral shells at rate of 60 an hour. The challenge of ever increasing boiler pressures has been met by stationary hydraulic riveters exerting 275 tons on the rivet.

The industries joining lighter thicknesses of metal reflect similar progress. An automatic line, producing 360 automobile chassis frames per hour, drives approximately 700,000 rivets a day. The efficiency of the riveting process also finds a place in our infant industry—aviation. The gas-tight sheathing of the all-metal dirigible ZMC-2 contains about 3½ million rivets which were driven at the rate of 5000 an hour.

Next Advances in Riveting

We may look forward to the introduction of portable yoke riveters (much lighter than machines now in use), alloy steel rivets and acceptance of cold riveting. Standardization of design and the constant increase in the volume of fabricated steel may justify power-actuated mechanical devices for the manipulation of riveters on straight run work whereby the bucker-up is eliminated and the operator controls two or more riveters merely by the manipulation of valves, making it possible for a crew of four men to drive at least 50 rivets a minute and the introduction of multiple riveting machines which will drive at least a dozen rivets for each operation cycle.

Structural shop methods of the past have been superseded by an exactness almost equal to that of the machine shop. The quality of the riveted joint is better than that of a decade or two ago and with the development of spacing tables, gang punches, riveters, etc., labor costs have been constantly reduced. It is still more economical to rivet the major part of our structural steel tonnage.

The five-story welded steel building erected at Sharon, Pa., by the American Bridge Co. for the Westinghouse company cost $5,800 in excess of the amount a riveted structure of similar design would have cost. The increased cost per ton of this welded structure over the riveted seems to be confirmed by the price of the 12-story Homestead Hotel addition erected at Hot Springs, Va., by the American Bridge Co. It was contracted for at $8 a ton in excess of what would have been bid for a riveted structure. Actual costs left them with a heavy investment in the welded structure.

The use of the pneumatic riveting hammer has created a clamor for the elimination of the noise prior to the development of sufficient evidence that it can be done. Perhaps Dr. Donald A. Laird, director, psychological laboratory, Colgate University, has forecast what may be the accepted procedure in structures of the future. Dr. Laird says: "Build a room with sound-proof walls and enough sound will come through the keyhole and reflect back and forth upon those walls to create a din. What modern buildings need is something upon those walls to absorb sound. Then people can leave the windows open even if riveters are working across the avenue."

There is a field of usefulness for both welding and riveting and we believe the advancement of both processes lies not in competition but in their supplementing each other. We cite a few examples:

Combined Use of Riveting and Welding

Six-mile pipe line for Springfield, Mass., water supply. Longitudinal seams were welded, girth joints field riveted.

Tube segments for the Detroit-Windsor vehicular tunnel. Longitudinal joints were welded, circumferential joints riveted and calk-welded.

The Mokelumne water supply project serving Oakland, Cal. Longitudinal seams were welded, circumferential joints field riveted.

An extension to the power house of the Haddon Hall and Chalfonte Hotels, Atlantic City, N. J. Columns were shop welded, beams and girders shop riveted, field connections bolted and welded.

Addition to the Ohio Valley General Hospital, Wheeling, W. Va. The shop fabrication was riveted, field connections bolted and welded.

Welding will replace riveting only when proved more economical, less dependent on skilled labor and assuring equal safety.

The American Society of Mechanical Engineers has set itself to the task of reviewing the present state of knowledge of riveted joints together with an extensively abstracted bibliography on the subject. This is a commendable undertaking and will be of material assistance in determining the lines along which research should be conducted.

Driving Special Head Rivets Cold

The forming of the head requires the greatest part of the pressure necessary to drive a rivet. In the construction of gas holders, where rivets as large as 3 in. in diameter are being driven cold, a flat driven head is accepted; holes are filled, there is no distortion and there is a saving in rivet stock. A comparison of pressures necessary to drive rivets (structural quality) cold with both standard button head and special head is here tabulated.

Tonnage to Drive Rivets

Rivet Diam., In.	Button Head		Special Head, Cold	Size of Special Head, In.
	Hot	Cold		
⅝	20	50	30	5/32 x 15/16
¾	30	70	40	3/16 x 1 1/8
⅞	50	100	60	7/32 x 1 5/16

*President, Hanna Engineering Works, Chicago. From an address before the American Institute of Steel Construction, Nov. 14.

Getting Open-Hearth Steel Quality

Operators Discuss Methods of Achieving Specified Characteristics—Heating and Rolling of Ingots and Blooms—Control of Slags

LAST week we carried on pages 1307 to 1310 the first portion of the discussions of the open-hearth committee meeting of the American Institute of Mining and Metallurgical Engineers. The story is continued in the paragraphs below. As in all of these sessions for several years, there were no prepared papers. The meeting took more the form of a round-table discussion and each topic was attacked by several men, representing varying practices in different plants.

Quality Control for Rimmed Steel

REPORT of one of the two Quality Control Committees was made by its chairman, J. M. Hughes, Sharon Steel Hoop Co. Quality improvement in rimmed steel was reported to be obtainable largely by controlling the evolution of gas in the steel and its escape from the ingot before solidifying. Along with this goes control of the carbon in the furnace operations. The pig iron used has a definite bearing on the subject. A hot slag of uniform composition is required, to hold the sulphur within limits.

As a result of tests extending over a year, slag analyses have shown fairly consistent results. Silica and alumina combined have fallen for the most part (79.5 per cent of the cases) between 48.1 and 49 per cent. Three-fifths of the remainder fell between 47 and 48 per cent, and the rest between 49 and 50.

Fairly Uniform Results

As to the iron content, about 1860 tests showed 43.7 per cent between 1.01 and 1.20 per cent FeO. Half of the remainder—29.6 per cent of the total—were between 1.21 and 1.35 per cent. None of the tests ran above 1.50 per cent. Sulphur showed more than half of the total tests between 0.021 and 0.030 per cent, this range accounting for 57.4 per cent of all. Another 38.4 per cent ran from 0.031 to 0.040 per cent sulphur, while the remainder were outside these limits.

Low iron oxide content in the steel represents good quality in the steel. An analysis was given for averages for 317 successive heats, ranging between 0.07 and 0.13 per cent carbon content, with the following results in the slag: 12.26 per cent silica; 17.34 per cent FeO; 5.01 per cent Fe_2O_3; 44.21 per cent lime and 9.07 per cent MnO. Of these heats about two-fifths represented 0.10 per cent carbon. The remainder were above and below this limit, with only 26 of the total below 0.09 per cent and the same number above 0.11 per cent.

Operating Requirements

Furnace bottoms must be kept in good shape if trouble is to be avoided. The charging rate of scrap in tons an hour has a bearing. The metal in the ladle may be profitably treated with some super-deoxidizer. Tapping temperatures should be about 2850 deg. Fahr.

With a 1¾-in. nozzle an ordinary heat should be teemed in about 45 min. If the nozzle is 1½ in., about 10 min. longer will be required. If the heat is charged into the soaking pits within 70 min. after the first ingot is stripped, the steel should remain in the pits about 2 hr. 15 min.

In discussing this report, Dr. C. H. Herty, Jr., of the United States Bureau of Mines, expressed the opinion that we can make as clean steel with 22 per cent FeO in the slag as with 16 per cent, if the steel has been properly deoxidized.

Quality in Killed Steel

KILLED steel was reported upon by William C. Kitto, Pittsburgh Steel Co., chairman of the committee on that subject. It was stated that pig iron is wanted with silicon between 0.90 and 1.25 per cent. This iron is wanted hot and from as smoothly working a blast furnace as possible.

The particular furnaces reported on have capacities from 140 to 250 tons, with bath depths from 26 to 36 in. It is customary in these cases to add one half of the ferromanaganese in the furnace and the remainder in the ladle, when making steel for tin bar. For all other heats, all of the ferromanganese is added in the ladle. These heats are poured into molds measuring 16 x 38 in. and 22 x 24 in.

For high-carbon seamless tubing with 0.35 to 0.50 per cent carbon, and for bars and billets having from 0.40 to 0.75 per cent carbon, in 93-ton heats, it was reported desirable to melt so that about 5000 lb. of molten iron can be added one hour before tapping. These heats are made with 12.5 per cent limestone additions. In this case both ferromanganese and ferrosilicon are added in the ladle, the pouring temperature being such that a skull of 1000 to 1500 lb. is left in the ladle. This steel is teemed slowly for the first 6 in. of the ingot and again for the top 12 in.

Avoiding Too Hot a Furnace

Discussing the reports on steel quality one company reported working the furnace on the cool side for rimming steel until almost at the desired tapping carbon; then the temperature is raised and the heat is stirred with rods. The air supply is shut off a few minutes before tapping, for two reasons: One is to relieve the pressure on the surface and thus facilitate removal of the oxides from the bath; the other is to prevent thinning of the slag by too much air.

Another speaker referred to the half-inch skin on rimming ingots extending up 14 to 18 in. from the base. Above that point the ingot is likely to be practically solid.

In another plant, making killed steel of 0.55 to 0.80 per cent carbon, in 75-ton furnaces, it is customary to take out the heat in from 2 to 2½ hr. after an ore addition. This heat is tapped at the high temperature of 2950 deg. and then held for 8 or 10 min. in the ladle, during which period it drops about 100 deg. The steel is bottom poured at the rate of about 3 tons in 4 min. Ferromanganese is added in the furnace and 50 per cent ferrosilicon is added in the ladle.

Steel Melting Practice

IN the absence of Roy L. Leventry, Republic Iron & Steel Co., Youngstown, chairman of the Steel Melting Committee, the report was read by Howard McClelland, of the same company. Plants using cold stock can regulate the iron charge by proper mixing of irons of known analyses. In a hot-metal plant, however, a mixer is necessary. If the blast furnace is not running evenly, the open-hearth furnace will need an extra charge of lime or limestone and more time will be required to make the heat. Ideal conditions call for silicon of about 0.90 to 1.25 per cent and managanese 1.75 to 2 per cent.

Changing the proportion of hot

metal in the charge from 45 per cent to 70 per cent has been found to decrease the production of ingots at the rate of about 1 per cent for each 4 per cent increase in the metal charge. Correspondingly, the bottom costs on the furnace will be increasing.

Gain from Larger Heats

Increasing the charge in a furnace by 100 per cent will increase the daily output about 50 per cent, with the same working force. The most desirable depth of furnace bath was reported between 2 and 3 ft. There is less bad bottom trouble on a deep bath and good steel can be made with the depth as great as 40 in., according to this report.

Charging delays have an important bearing on tonnage; these must often be met, because of the poor general quality of scrap now obtainable, a condition which is not likely to improve. A small amount of alloy in the scrap may have a disproportionately disastrous effect on the quality of the finished bar.

Lime additions increasing from 8 to 11 per cent of the weight of the metallic charge were found to result in a loss in ingot tonnage, amounting to about 1 per cent for each ½ per cent of lime addition. Deep furnaces and, to a less extent, large furnaces of standard proportions will take less lime than will shallow or smaller furnaces. This follows from the fact that there is less surface area, in the large or deep furnace, for each ton of metal to be covered.

Characteristics of Charge and Yield

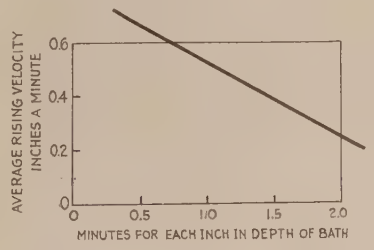
Discussing this report, one member reported that both busheling scrap and hydraulic scrap are good, but with the qualification that the latter must be from a reliable dealer and well compressed. With 118-ton furnaces his plant charged, in the first nine months of 1929, a total of 42.7 per cent of metal and 57.3 per cent scrap. This included 31 per cent hot metal, 10.1 per cent cold pigs; 1.6 per cent molds and stools, as the pig iron charge. The scrap charge was 1.6 per cent furnace and pit scrap; 31.8 per cent heavy melting scrap, No. 1 and No. 2; 16 per cent busheling scrap, 3.3 per cent hydraulic compressed scrap and 4.6 per cent bundling scrap.

On these furnaces the limestone charge was 8.9 per cent. The yield in ingots was reported as 92.5 per cent, with 0.4 per cent butts; 1.6 per cent pit scrap and 5.5 per cent loss. These furnaces are making about 7200 tons of steel each, in a month. They have averaged about 5½ min. loss to the heat, because of bottom trouble. Speed of making heats has averaged 9.85 tons an hour from tap to tap and 10.5 tons from charge to tap.

Pouring Practice

REPORT of the Pouring Practice Committee was made by its chairman, Kenneth C. McCutcheon, American Rolling Mill Co., Ashland, Ky. The report recommended the use of as shallow a ladle as possible, both to limit the hydrostatic head and consequently the force of the stream entering the mold, and to allow the impurities a chance to rise easily through the metal. Nozzles should be selected with regard to consideration of all conditions to be met. These include both the type and temperature of the steel, the size of the mold and whether pouring is to be top cast or bottom cast.

Rate of rise of steel in the mold is an important matter. It should be as slow as can be arranged, with due regard for other considerations. Tests made on 30 x 70-in. molds showed that 9 in. a minute rise gives better all-around results than either 6 in. or 15 in. There are fewer snakes and cracks



Rate of Clearing of Silicates from Open-Hearth Bath

in the surface under these conditions. Comparison of chipping costs of a ton of steel with varying rates of rise in the molds showed $3.16 average where the rise was less than 5 in.; $1.21 for a rise of 5 to 10 in.; $1.08 for a rise of 10 to 15 in., and $2.21 where the rise was 15 in. or more.

Control of the rate of rise in bottom pouring is had by the number and size of ingots in each group poured. To get a good surface on narrow slab molds, bottom pouring should be practiced whenever the molds are small.

One operating man expressed the opinion that a shallow ladle does not need a long nozzle to avoid spraying the sides of the mold in teeming. A deep ladle, on the other hand, does require a long nozzle to get away from this trouble, because of the great ferrostatic head back of the stream of steel entering the mold.

Progress on Open-Hearth Investigation

NEW methods of determining iron oxide and silicates were reported upon by Dr. C. H. Herty, United States Bureau of Mines, Pittsburgh, who has been engaged for several years in a study of open-hearth furnace reactions and changes in the slags and bath constituents, with a view to improving the quality of steel manufactured. Dr. Herty reported that under certain conditions the Dickenson method of measuring these metalloids caused incorrect results, with a residual manganese of about 0.20 per cent, unless we have also in the steel from 0.10 to 0.15 per cent of silicon.

A new method for determining the ratio of inclusions depends upon a scale on the microscope eye-piece. Particles showing up in the field of the microscope are usually readily identifiable and are practically circular in shape. The scale permits measuring the diameters, upon which the areas are computed and added up. Then, by applying the ratio of density for the inclusions to that for steel (2.3 or 2.5 to 7.8) the percentage of inclusions for cast steel may be obtained.

Method of Calculation

For iron oxide the practice is to deoxide with aluminum in the testing spoon. When this is analyzed for Al_2O_3 it may be noted that about 0.4 per cent aluminum will take care of all the FeO in the steel. Anything more than this is wasted except for a little excess so as to be sure of having enough, and to care for what may be slopped over. The remainder burns and makes a scum on the surface. The atomic weight relation between 3FeO and Al_2O_3 is 2.11. If, therefore, we multiply the amount of Al_2O_3 from analysis by 2.11 we obtain a figure which is three times the FeO in the steel.

Thus are determined the silicates on the wild sample and the iron oxide on a sample killed with aluminum. To make a silicate particle rise out of the bath it is necessary to have sizable particles. Doubling the diameter increases the speed of coming out about fourfold. The rate of cleaning of the bath for each inch of depth is proportional to the rising velocity of the particles. A characteristic curve covering this point is given at the left.

Much more rapid cleaning of the bath is obtained with ferromanganese added ahead of the ferrosilicon than with ferrosilicon alone. With shallow baths, ranging from 17 to 22 in., the time required for rising of silicates figures out at about 1.5 min. for each inch of depth, whereas with deep baths, up to 41 in., the time is 1.6 min., as found by a test, which is substantially the same rate. With the deep bath Dr. Herty thought it might be better to kill the steel in the ladle, instead of in the bath.

Agreement with this idea was expressed by one metallurgist. Another man, some of whose furnaces have about a 36-in. depth of bath, reported that these take about 10 per cent less ferromanganese to each ton of steel than similar qualities of steel made in a 24-in. bath. This applies particularly to steel having a residual of 0.25 to 0.30 per cent manganese, the quantities used being respectively 10 lb. and 11 lb. to the ton of steel made.

Less Oxidation on Deep Bath

This phenomenon was explained by Dr. Herty on the theory that the deeper bath has much less oxidation to the ton, because the area of the surface is less for each cubic foot of volume, and it is that top surface which absorbs the FeO and passes it down through a gradient toward the

bottom. Part of the bath near the bottom may be virtually inert.

One operator expressed the opinion that the open-hearth bath for economy in practice should be 30 or 36 in. deep, rather than 24 in. Dr. Herty, however, dissented from this opinion in the case of such furnaces as have the steel deoxidized in the bath.

It is common practice to add a box of lime about 30 min. before the tapping, to thicken the slag near the tapping time on killed steel. Some, however, try to keep the slag all along at such consistency that lime will not have to be added at that time.

Use of Purifiers for Iron and Steel

ALKALIES in cast irons have now reached a commercial basis, according to one of the operating men. Soda ash and limestone seem to be much alike in their results. Small amounts of soda ash are capable of increasing the chemical activity of open-hearth slags, according to this speaker. Fused soda ash is still in the experimental stage.

Considerable soda ash is used in the Aston process in making wrought iron, said Dr. Herty. This is put into the cupola before blowing and the purpose is to get the sulphur down.

Reactions of this type require a reducing condition, according to another speaker. The material would have no effect on steel in the ladle. It might make the slag in the furnace more fluid, but, according to this man's opinion, this result could be achieved otherwise more cheaply.

One operator uses a purifier on deep-drawing strip steel of characteristics similar to automobile body sheets. His practice is to use about 125 lb. in a ladle of iron from the mixer and to put 350 lb. on top of the lime in the furnace. This makes the steel pour in rather oily fashion; it rims in better and rolls better into slabs.

Manganese Vs. Aluminum as Deoxidizer

FOR rimming steel the question was discussed as to the quantity of manganese replaced by one pound of aluminum to the ton of ingots. One operator stated that the higher the manganese is the poorer will the steel rim. He said that it is necessary to cut down the aluminum addition as the manganese is increased. What is added goes into the ladle. On a sheet bar heat, with 15 lb. of aluminum in the ladle, he had a beautiful rimming action; on a heat of Armco steel, on the other hand, 100 lb. of aluminum in the ladle caused an equally beautiful rimming action.

Another operator reported making no aluminum additions on a steel of 0.08 to 0.11 per cent carbon, with the manganese 0.35 to 0.40 per cent. Still another man making 0.08 per cent carbon steel said he uses 20 lb. of aluminum in the ladle when the manganese is 0.35 per cent. It takes 30 lb. of aluminum, however, for the same rimming action when the manganese is 0.25 per cent.

He thinks that more aluminum is required to take care of gas evolution. As the manganese analysis is not known until after the steel is in the ladle, the excess quantity of aluminum is put into the molds. This same experience was reported from another plant, where no aluminum is used for rimming steel of 0.08 to 0.10 per cent carbon when the manganese is 0.45 per cent. When the manganese is 0.25 per cent, however, one ounce of aluminum to the ton of steel is put into the mold.

Proper Time for Adding Ore

SEVERAL men stated that no harm has been experienced through adding ore to the heat before the lime is all up, unless the ore is in large lumps. In this case it may kill the lime boil. A better quality of steel is customarily obtained, however, when the ore is added later than when it is put in with a high metal charge. To avoid bottom trouble, however, it was generally the opinion that it is better to get the lime all up before the ore is added.

Atomizing Oil Fuel with Superheated Steam

SUPERHEATING the steam for atomization to 700 or 800 deg. Fahr. reduces the oil consumption by about 2 gal. to the ton, compared with a low superheat, according to one operator. This high temperature, however, is bad on the valves. To offset this condition, one plant has built its own valves of Monel metal to take care of the high temperature.

Use of low-gravity oil makes it necessary to put in a water-cooled burner. A three-way valve may be used to reverse the oil. During reversal there is then no pressure in the line between the valve and the burner. There may be a momentary surge of oil accompanied by smoke as the oil lights at the other end.

In a large steel casting plant, which does not use reversing valves for this purpose, the oil is shut off at one end and then turned on at the other. There is thus no loss of oil or of heat going to the stack. Another plant reported the use of a relief valve in the pump house to keep the oil pressure uniform, while a steam manifold regulates the steam pressure.

Low-pressure oil of 46 Baumé, with a pressure of only 23 lb. at the standpipe, was said by one speaker to need a temperature of at least 175 deg. Fahr. at the burner. Trouble results if the oil temperature drops below 150 deg. Oil is heated customarily in the storage tank before it is pumped to the furnace.

One plant uses a temperature regulator with a motor-operated valve to hold the oil hot in the suction system. There is also an individual heater at each furnace, which is used to get 8 to 10 gravity oil up to 250 deg. Fahr.

Storage tanks in this case have a capacity of 3,900,000 gal. One tank of 1,500,000 gal. capacity has been cleaned out about once a year, the deposit of sludge in the bottom being about 2 ft. deep. This condition has been largely remedied through the use of an oil which is heavy enough to pick up sludge and foreign particles and float them in through the furnace, where they are burned.

Soaking Pit Heating and Chipping Costs

OVERHEATING or a long soak in an oxidizing atmosphere was reported to result in a lot of fine hair-like seams in the surface of a billet. These have to be chipped out. In the plant from which this report was made, comparison was instituted between oxidizing and reducing atmospheres in pits, the latter being found to result practically in freedom from seams.

Heating of cold ingots was suggested as resulting sometimes in a center harder than the surface and likely to produce trouble. Much difficulty was reported in one plant both from soaking pit heating and in the reheating furnaces for the finishing mills. Another man stated that considerable difficulty is experienced whenever the ingots are overheated.

Splash or mechanical trouble on one side of the mold was given as the probable cause of surface defects and pits.

Rolling Temperatures

Temperature for heating soft sheet bar steel in soaking pits was recommended variously from 2200 to 2400 deg. Fahr. Rephosphorized ingots should not have so much heat applied, according to one authority, as those which are not rephosphorized.

High-sulphur ingots, however, seem to make no difference, according to one operator, who stated that he is getting 87 per cent yield from ingots to billets containing 0.08 to 0.16 per cent sulphur, 0.05 per cent phosphorus and 0.70 per cent manganese. This man stated that when a heat melts with 0.045 to 0.05 per cent sulphur he will not use it for screw stock. He wants sulphur as low as 0.03 per cent, and then the steel is resulphurized in the ladle. Unless this precaution is adopted the steel will not roll so well.

(*To be concluded*)

Chicago Engineers Obtain Large Soviet Contract

The MacDonald Engineering Co., Chicago, has obtained from the Soviet government a $110,000,000 contract for the construction of a chain of cement plants, grain elevators, flour mills and miscellaneous industrial enterprises throughout the Soviet Union. The government will supply the capital, material and labor, while the designs of the plants will be made and the work directed and supervised by a staff of 45 American engineers.

Oxy-Acetylene Welders Review Progress

Pipe Joints, Both in Trunk Lines and in Industrial and Office Buildings, Aircraft and Steel Fabrication, Expand Materially

HEALTHY, normal growth of the industry, successful competition with competitive methods and progress in research and development work were reported at the thirtieth convention of the International Acetylene Association, held Nov. 13 to 15 at the Congress Hotel, Chicago. Statements of advancement, both technically and in application and expansion clearly indicated the progress made by the industry in the past year. No doubt exists in the mind of Bennett Chapple, vice-president, The American Rolling Mill Co., Middletown, Ohio (who delivered the keynote address), concerning the future use of steel products and the important part which welding will play in fabrication. Industry, he said, depends on having iron and steel in such forms as engineers can make use of them. Welding of thin sheets offers great possibilities, and in this connection he mentioned the fact that the automobile industry uses from 35 to 40 per cent of the output of American sheet mills. He predicted steel elevated highways, bathroom fixtures made from fabricated steel and greater use of steel in road and sidewalk construction. Programs for making rivers navigable will result in orders for thousands of steel barges. He foresees steel producers making greater efforts to promote the use of their products for many new purposes.

Pipe Line Construction More and More Important

THE report of the Oxy-Acetylene Committee pictures the progress of the industry both technically and in its numerous applications.

Among the important subjects covered is that of pipe lines for oil and gas. Oxy-acetylene welding has sometimes been carried on by owners of the lines and sometimes by contractors; the results have varied decidedly, particularly where there has been a question of speed of completion. Companies contracting to do oxy-acetylene welding must be able to assure the owners of the lines of their ability to weld at a reasonably low cost and with a large enough force.

Some means of reducing the cost of making a joint are indicated, notably by teaching welders to make a thoroughly satisfactory weld at a faster rate by using larger flames, by decreasing the angle of the vee, and by keeping the weld as narrow as consistent with good workmanship.

Unquestionably, workmanship on recent lines has been better than it was even a year or two ago. This has been due to improvement in methods of testing welds and to the introduction of higher grades of filler rods. Several large organizations have constructed their lines in accordance with the strictest procedures outlined by experienced welding engineers.

Workmanship Improved By Testing

A recent important development in test methods has been a portable testing machine for making tensile tests in the field upon specimens which have been removed from pipe lines under construction. In this way the essentials of a testing laboratory are brought directly into the field for continued sampling of workmanship on the job, where the workman can, if necessary, see the result.

A recent example of the successful use of regular check inspections to raise the standard of welding was on a 20-in. pipe line belonging to the Empire Co. In the first period of a few days, the average strength of welds selected as apparently inferior ones and cut from the line averaged between 45,000 and 50,000 lb. per sq. in. In the next period, selected apparently inferior welds ranged from 50,000 to 55,000 lb. per sq. in. The third set ran 55,000 to 60,000. New welds cut at random averaged above 60,000 lb. per sq. in., which is the minimum specification for the pipe steel; three-quarters of the joints outpulled the pipe.

This report stressed the need for standardized methods of testing and qualifying welders for specific tasks. This need has already been recognized by the American Welding Society and a committee has been appointed to prepare standard specifications for the qualification of welders. This will enable employment managers to know what to expect from welders who claim they are expert in specific fields, and will also enable training schools to keep in mind definite standards for qualification of welders before granting a certificate.

Demand for pipe welders and desire of plumbers' and steamfitters' unions that their members be trained to fabricate and weld pipe has greatly increased vocational school activities in some districts. Certain engineering schools that work closely with the industries are cooperating in manual training, including welding, and thus are extending their work in a way quite satisfactory to the welding interests.

Welding in Power Plants

While engineers are not now specifying welding to a very great extent, because they can never be sure about the welding ability of the sub-contractor, they are nevertheless allowing responsible contractors employing trained pipe welders to weld wherever it is economical, at the option of the contractor, for working steam pressures up to 250 lb. Above that pressure many engineers are still skeptical of its advisability. On the other hand, it is not uncommon for the pipe fabricating concerns to weld steam headers for pressures of 400 to 600 lb.

Aircraft Industry Uses Welding Exclusively

WELDING in this industry is now being extended from fuselage construction, where it is quite common—almost universal—to work on other parts of the structure and engine.

Re-inspection of welded steel fuselages which have been in service for six or seven years have noted that welded joints are in perfect condition; tests to destruction of some of the joints have given just as satisfactory strengths as was predicted.

The Waco Aircraft Co. has found, as reported by Russell F. Hardy, chief engineer, that highest efficiency in any welding department is obtained only through the employment of a capable and conscientious personnel, working under the most favorable conditions, with efficient equipment and first class materials.

Five papers were devoted to the subject of welding in the aircraft industry. J. B. Johnson, chief metal branch, War Department, Wright Field, Dayton, Ohio, reported on a recent inspection of a number of welded steel fuselages which were built in 1924 and which have been in practically continuous service in the United States since that date. These fuselages had been through an average number of overhauls of 2.4, and the average number of hours between overhauls was 291. The reason was usually deterioration of the fabric-covered wooden wings.

The amount of repairing on the fuselage skeletons was small and con-

sisted principally of straightening bent tubes or replacing members in the engine section which had failed due to vibration, when the original mount contained members which were too light in weight.

A representative fuselage was surveyed by cutting out the joints at the principal stations and pickling them in acid for 24 hr. The pickled joints were examined with a magnifying glass for cracks, seams, lack of bond, or other weaknesses. There was no evidence of any deterioration or fatigue cracks. The joints, as far as could be determined, were in excellent condition. Tension tests on a few of the joints corroborated the visual examination—the joints developed their rated strength.

Notable Piping Installations in Buildings

One of the greatest problems for heating and plumbing contractors is the attitude of labor toward new methods and processes, continues the Report of the Oxy-Acetylene Committee. The industry is now established for threaded and flanged work, and labor is trained along the same lines; therefore, it is obvious that a turnover to welding involves problems in both equipment and man power. So far, it appears that there will be no serious invasion of this field by welders from the outside, but rather that the steam fitters will be trained for the new work. This is logical, as the skilled steamfitter is thoroughly familiar with the problems of steam flow, water flow, drainage, friction losses and insulation requirements, and all he needs to know is the essentials of the new art in order to adapt it to his work.

Perhaps the best evidence of the possibilities of welding in this field may be obtained from a review of what has already been accomplished. During the past year or two there have been some outstanding installations of welded piping that are worthy of note. In New York, piping systems have been welded throughout the New York Central Building, in the Cathedral of St. John the Divine, in the new office building of the New York Life Insurance Co., occupying the old site of Madison Square Garden, and in several public school buildings; in Chicago, the 37-story Carbide & Carbon Building; in Detroit, the massive Fisher Building; in Cleveland, the B. F. Keith Building and the Union Terminal Building.

Machine Cutting an Essential to Fabrication

MACHINE cutting has progressed materially in the direction of mass fabrication, or as it may better be called, replacing of castings by steel elements shaped by automatic cutting machines and fabricated by welding and perhaps bending.

The subject was discussed by Otto C. Voss and G. E. Matters, of Allis-Chalmers Mfg. Co. The automatic cutting torch is now used at their plants on almost all products, including parts for crawler and wheel type tractors, bases, yokes and rotors for electric generators and motors, transformer covers and tanks, drums and operating levers for hoists, guards for steam engines, parts for cement grinding mills and kilns, and steady plates for condensers.

After the shape cutting machines had been in service a short time, considerable economies developed in using up smaller pieces of plate steel. The volume of scrap has thus been greatly reduced by using it for valve rings, flanges and similar small parts.

Fabrication based on steel plates, shapes, and roughly preforged billets simplifies purchasing, stock-keeping and storage. In Europe, cutting machines have been made with a number of fine adjustments. They may fit purposes where mass fabrication is not essential, but their cutting range is limited, and it takes much time to adjust the machines for the various shapes. In the United States, simple machines with considerable cutting range have been adapted to diversified fabrication.

A tendency to use machines with more than one torch is noted. Many machines already run with two torches, some with four; recently a machine with six blowpipes has been put in operation. This means that, after some training, one operator and helper can produce six times the work with one machine and cut up a large plate without further handling.

Structural Steel Welding Is Expanding

Welding in the fabrication of structural steel has rapidly come to be an adjunct of the riveting process, according to H. M. Priest, American Bridge Co., New York. For certain types of industrial and tier buildings it offers possibilities in reducing the weight of steel required, in the simplification of details and a more flexible adaptation of the steel to architectural requirements. Repairs or additions to existing structures can often be carried out most advantageously by employing the welding process; numerous bridges have been reinforced to carry the increased locomotive loadings.

Mr. Priest noted that it is well to consider how welding affects shop procedure. In the first place, it does away with riveting and consequently with the punching operation. However, a certain amount of punching will still be required for bolting the members together in the field. One principle of economic fabrication follows quite obviously that punching of main material should be avoided and holes be kept in the small details, since the latter can be handled much more readily and cheaply at the punches. In other words, once a saving of one or more operations becomes possible, that saving should be utilized by proper arrangement of the details. Material in the shop should be segregated and as far as possible the number of different operations to be performed on each piece should be limited. With a reduction of punching there is a corresponding decrease in template work and an increase of work of laying out directly on the steel. Whenever there is sufficient duplication to warrant the expense, it is desirable to construct jigs for locating and holding the parts in their proper relation until welded. Clamps replace bolts in assembling and some thought should be given to reducing the number required.

Hard-Facing Metals, a New Development

During the current year considerable progress has been made in the development of hard alloys and metals for wearing surfaces and in their effective applications. The usefulness of some of these materials is based on inherent hardness at room temperatures; others are hard at elevated temperatures.

Allied to this group there have been important developments during the year in materials used as diamond substitutes in oil well drilling and for machine tools. On rock drilling tools the hard metals or carbides must be applied to material of shock-resisting qualities, usually with the oxy-acetylene welding blowpipe.

These diamond substitute materials have given long life to fishtail bits, machine tools, chutes, conveyor flights and other equipment. These expensive materials must be applied in small units effectively and economically.

New Officers Elected

Officers elected for the coming year are: President, C. A. McCune, director of research, American Chain Co., Bridgeport, Conn.; vice-president, W. E. Flannery, vice-president K-G Welding & Cutting Co., Inc., New York; and A. Cressy Morrison, New York, secretary-treasurer.

Award of the Morehead medal for 1928 was made to the late Samuel Wylie Miller, for research in metallurgical and mechanical engineering phases of welding. Mr. Miller was consulting engineer for the Union Carbide & Carbon Research Laboratories, Inc., Long Island City, New York.

Sheet and Tube Company to Sell Zanesville Property

The Youngstown Sheet & Tube Co. has given an option to the Zanesville Chamber of Commerce, Zanesville, Ohio, for the purchase of its plants at that point. The company's Zanesville properties are inactive, the machinery having been dismantled and removed to Youngstown. A plan is under way to form a new company to manufacture steam shovels and road building machinery, and the Sheet & Tube company has agreed to take, as part of the purchase price, $150,000 of stock in the new company which plans to occupy the Zanesville plant.

Electric Heating and Welding

Both Steel and Non-Ferrous Metals Covered in Pittsburgh Conference—Direct "Fuel" Cost Is No Criterion

ADVANTAGES of electric heating in the manufacture of steel and iron and steel castings, as well as recent developments in the electric arc-welding of metals, were outlined at a conference on electric heating and welding held in Pittsburgh on Nov. 13 and 14, under the auspices of the Pennsylvania State College, State College, Pa., and the Association of Iron and Steel Electrical Engineers.

Among the uses of electric heat which were discussed, annealing furnaces, steel melting furnaces, salt bath furnaces and electric galvanizing tanks were emphasized. A special feature of the conference was a talk at the dinner meeting on the closing day by Lieutenant-Commander C. E. Rosendahl, United States Navy, describing his flight around the world on the Graf Zeppelin.

Welding Heavy Materials

A potential market for between 2,500,000 and 3,000,000 tons of steel a year was suggested by J. F. Lincoln, vice-president Lincoln Electric Co., Cleveland, in describing the possibility of replacing steel castings for many purposes by units built up of welded structural steel. He pointed out that the patterns for many steel castings cost more than the first casting made from the mold, thus adding considerable expense. He showed a number of slides tending to illustrate the difference in appearance between steel castings and electrically-welded units and pointed out that objection to welded articles on the ground of appearance is unwarranted.

Discussion of this paper included several inquiries regarding the method of electrically welding steel pipe used by the A. O. Smith Corporation, Milwaukee. Mr. Lincoln said that that company used steel of high tensile strength and that the entire seam is welded at once under the Smith plan.

Methods of building up metal by welding on materials which are subject to abrasion in use were emphasized in a talk on recent developments in electric arc-welding by K. L. Kansen, Northwestern Mfg. Co., Milwaukee. He explained that bits for oil well drilling are now being improved by building up metal and that this process is finding use also in repairing worn spots on steel rails.

In the non-ferrous field Mr. Hansen pointed out that considerable progress had been made recently in welding copper alloys, particularly on the rotor bars of a.c. motors. Other fields in which arc-welding is gaining ground are in stainless steel and in the fabrication of steel tanks and annealing pots.

Advantages of Electric Heating

Pointing out that the high cost of installing electric heat as compared with other fuels often prevents its adoption, Wirt Scott, special engineer, Westinghouse Electric & Mfg. Co., Mansfield, Ohio, cited a number of advantages of electric heat in actual performance. Among them were uniformity of quality, dependability of product, lower cost of rejections, decreased floor space, decreased cost of labor, elimination of rigid testing and inspection on account of confidence in product, decreased cost of labor after heat treating, saving of labor in starting up furnaces, better working conditions and consequent reduced labor turnover, less handling of materials, less accessory equipment required, reduction in accidents, reduction in fire hazard, reduced maintenance, lower scrappage of product, reduction of replacements after goods have been shipped and better shop appearance.

By attaching a monetary value to each of these items, Mr. Scott reached the conclusion that an average plant might save $986 a month by the use of electricity while the excess cost of installation over other fuels is only $180.

Outlining the use of the electric annealing furnace, James Kniveton, Ryan, Scully & Co., Philadelphia, pointed out that it should be utilized principally on items where quality is uppermost and which can stand the higher production cost. He stated that absolute control of oxidizing gases during annealing is possible with the electric furnace, and that, contrary to former belief, slight oxidation is sometimes advantageous.

Mr. Kniveton advised companies operating electric annealing furnaces to forget operating costs for a time, and concentrate on the metallurgical results obtained. The furnace is especially adapted to continuous operation and, although the cost is often higher, the superiority of the product offsets this.

It was brought out in the discussion of this paper that the increased costs could easily be added to the selling price of the finished product if the sales department were fully instructed as to methods of emphasizing to the trade this superiority in product.

Similarity of the electric melting furnace now used most commonly to the first steel-making furnaces was pointed out by Frank W. Brooks, chief engineer, William Swindell & Brothers, Pittsburgh, in a paper on electric furnaces for steel melting. Mr. Brooks outlined the growth of the electric steel-melting furnace over the last 20 years and described the four principal types in use at present—the direct arc-induction, the indirect arc-induction, the core-type induction and the coreless-type induction furnace.

He illustrated the various types by photographic slides, pointing out the principal differences. Recognizing that European electric furnace practice is often considered superior to that of this country, Mr. Brooks stated that labor in those countries is more painstaking in securing quality of product, while quantity as well as quality is considered in this country.

Discussing electric salt bath furnaces, A. E. Bellis, president, Bellis Heat Treating Co., Branford, Conn., emphasized the importance of the chemistry of the bath preparation to insure uniformity of quality. The operation of the bath is also highly important in protecting the surface of the article being treated, and the rate of heating demands considerable attention. Mr. Bellis described the operation of the salt bath at considerable length, illustrating his paper with slides showing successful installations.

Cost of Electric Galvanizing Justified

ADVANTAGES of electric galvanizing were described as self evident at the beginning of a paper on that subject by R. M. Cherry, General Electric Co., Schenectady, N. Y., but he admitted that its costs are somewhat higher than on other methods of galvanizing. The cost is accounted for largely by the cost of the heat, the zinc coating, maintenance, labor and quality.

Zinc coating makes up the largest part of this cost, but its thickness depends entirely on the temperature and accuracy of control, which can be regulated nicely. The cost of the zinc averages about $12 a ton of product, while the cost of electric power is $1 to $1.20 a ton. Maintenance and continuity of service are governed largely by the plant set-up, but the tank will last longer if it is uniformly heated.

Quality depends largely upon constancy of temperature, but the operator must be considered also and he is able to regulate the temperature

much more closely in the electric process. Mr. Cherry concluded his paper by citing a number of results of active operations.

Tool Steel Development

Owen K. Parmiter, metallurgical engineer, Firth-Sterling Steel Co., McKeesport, Pa., gave a general outline of the use of electricity in the development of tool steel. He said the electric furnace really made high-speed steel possible, because by its use alloys with high melting points can be melted. It also practically eliminated the human element in steel making of this sort.

Some of the advantages of electric furnace steel were enumerated as follows: Greater uniformity in chemistry, closer adherence to limits, greater purity physically, practicability of adding alloys in furnace rather than in ladle and adaptability to recovery of valuable alloy scrap. There also are a number of mechanical advantages, such as tilting for the pouring of steel and the fact that melting can be resumed at any time without long preliminary heating.

Develops New Cincinnati Cutter Grinder

SENSITIVE anti-friction table mounting, rigid bed with ample cross-sliding saddle support, and wide range are features of the new No. 2 cutter grinder recently announced by the Cincinnati Milling Machine Co., Cincinnati.

The box-type bed has three point support on the floor and contains an accessible motor compartment. The working table is of fixed height and operation is further facilitated by mounting the table on a sensitive roller bearing support—a new feature. As evidence of the effectiveness of this mounting, it is stated that, if a man of average size were to stand on the table, the movement would still be easy and free. The table slide rides on two long roller chains guided by four ball bearings, two on each end. Accurate cross-adjustment of the saddle up to 10 in. is obtainable by means of handwheel *A*, which is duplicated at the rear of the machine. The saddle is supported by two inverted Vee guides that are never exposed. The table can be swiveled and has the regular graduated swivel dial, a scale reading taper in in. per ft., also a means for fine adjustment.

Fine handwheel movement of the table, desirable for cylindrical and surface grinding, is obtained by engaging the knurled knob *B* and then turning the adjacent crank. Engagement of the knob, *B*, prevents table traverse except by means of the crank, which is an advantage when setting up a job. The knurled knob at the rear is used for ordinary cutter grinding. The table working surface measures 5¼ x 36 in. and the table movement in line with the centers is 18 in. Work 10 in. in diameter can be swung between centers. Work 27 in. long can be held between the ends of the table, while work 21 in. long can be handled between the regular head and tailstocks.

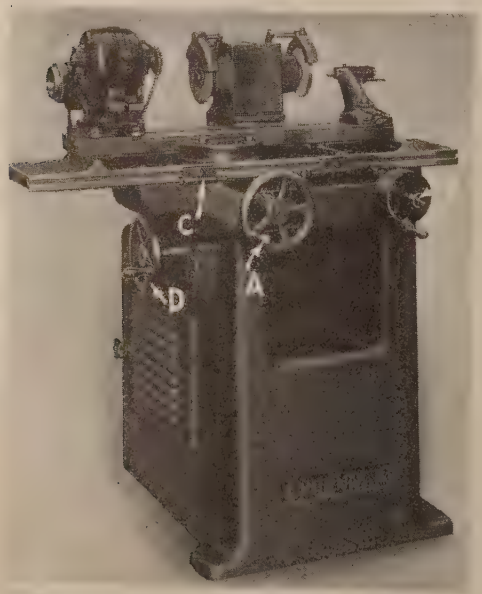
Facilities have been provided for attaching the new style tooth rests for any kind of cutter grinding, and cushioning dogs, shown at *C*, are attached to the side of the table for controlling the table movement. Alinement of tailstock and workhead is made by means of clamps and thumbscrews rather than by means of tongues that fit in the table T-slots.

The grinding wheel head is mounted on a column that can be adjusted vertically and swiveled in its bearings. Swiveling is facilitated by a lever which extends from the grinding wheel head, and column graduations from 0 to 240 deg. are provided. Vertical adjustments, up to 7½ in. maximum, are made by means of handwheel *D*, which has a dial graduated in 0.001 in. The grinding wheel spindle is driven by a special ½-hp. 3425-r.p.m. motor mounted at the lower end of the column. Motor shaft and spindle are parallel and the drive is through a straight belt. Provision is made for taking up belt stretch. A two-step cone pulley provides spindle speeds of 3850 and 5735 r.p.m. The wheel spindle is large and is mounted in anti-friction bearings. The grinding wheels are fitted on collets.

Lubrication of the wheel spindle bearings is from an oil reservoir on the back of the head. The saddle itself forms an oil reservoir in which the roller chains, upon which the table slides, are immersed. From this reservoir, wicks carry oil to the two Vee bearings. Centralized oiling is provided for the column elevating mechanism.

The workhead, which receives the shanks of end and face mills, swivels in a vertical and a horizontal plane, both having degree graduation. The company's patented clearance setting dial is employed. The spindle has the new standard taper hole on one end and a No. 12 B.&S. taper hole on the other end. Four taper collets are supplied for reducing the No. 12 B.&S. taper hole to Nos. 11, 10, 9 and 7 B.&S. taper holes.

The machine is furnished as plain or universal, the latter being the plain machine plus attachments for cylindrical, surface and internal grinding and a fourth attachment for gear cutter sharpening. The workhead of the universal machine is driven by a ¼-hp. 1750-r.p.m. motor. The operating floor space required for the machines is 4 ft. 10 in. x 5 ft. 10½ in. The plain machine weighs 1600 lb. and the universal machine 1750 lb.

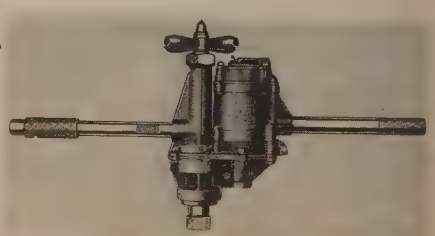


EASE of Operation Combined with Accuracy Are General Features of the New Cutter Grinder Shown at Left

New Pneumatic Drill

THE Independent Pneumatic Tool Co., 600 West Jackson Boulevard, Chicago, has developed a new rotary pneumatic drill, designated as the Thor 275, which has capacity for drilling holes up to 1½ in., and for reaming holes up to 1⅛ in. Its governed free speed is 350 r.p.m. The machine will carry a 50-lb. load at the free running speed and a 100-lb. load at a speed reduction of only 30 per cent. Smooth operation is a feature emphasized.

The machine weighs 35 lb., and may



THE Pneumatic Drill at Right Has Drilling Capacity of 1½ In. and Reaming Capacity of 1⅛ In.

be handled by one man. The construction is such that it can be used close on the side without removing the dead handle. The cylinder is made of nickel cast iron to withstand rotor blade wear, and ball bearings are used throughout the tool, including the spindle and gear.

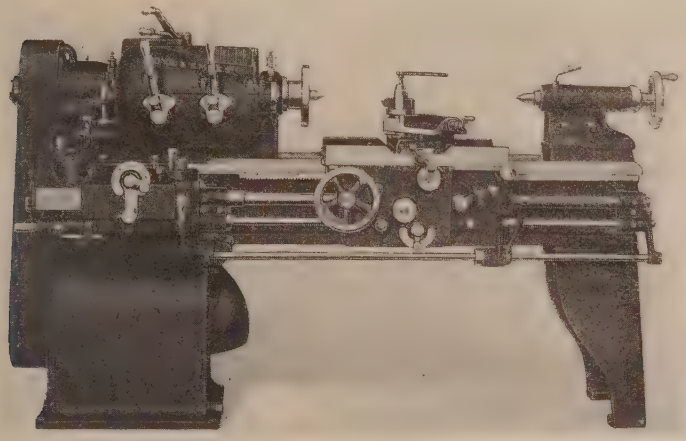
New Coneless Engine Lathes

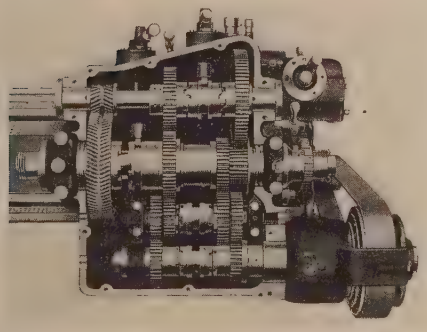
THE Boye & Emmes Machine Tool Co., Cincinnati, has placed on the market new 14 in. and 16 in. selective headstock "coneless" lathes. All gears in the headstock are constantly in mesh, and 12 spindle feeds are obtainable through 13 gears. Gears and clutches are of alloy steel, heat treated and all shafts are made of S.A.E. 3250 steel, and heat treated. The gears are of wide face and the clutches slide on shafts having multiple spline milled from the solid. Anti-friction bearings are used throughout, with the exception of the spindle, which has lapped bronze bearings, although anti-friction bearings can be furnished. The driving pulley with its multiple disk clutch is supported at each side by bearings. Thrust collars are hardened, ground and lapped.

Back gears are mounted in front of the spindle and are used for eight of the 12 speeds. Placing the backshaft and gears in this position is intended to bring the spindle pressure down against the headstock, instead of upward on the bearing caps. This arrangement also counteracts the upward lift of the tool. The face gear and pinion are of herringbone type. The quick-change gear box furnishes 40 changes of thread leads or feeds, the changes being made instantly without binding action on the levers. By changing two gears on the quadrant odd or metric threads are cut.

All gears in the apron, which is of box section, are of alloy steel and are supported on both sides. Cross feed and longitudinal feed frictions are of the cone type and are self-adjusting. An interlocking arrangement prevents engaging of the half nuts while the feed is engaged. The entire apron is lubricated from one oil reservoir. The carriage is of heavy construction and slides on two Vee ways. It is drilled and tapped to receive the follow rest at any time. Mounting the motor on an adjustable plate in the cabinet leg provides for tensioning the belt or chain. Either flat or multiple-Vee belt or chain drive can be furnished. The machines can also be equipped for single pulley drive from a line or countershaft.

The 14 in. lathe swings 16½ in. over the bed and the 16 in. lathe, 18½ in. Spindle speeds range from 15 to 402 r.p.m., and feeds from 0.004 to 0.112 per revolution of the feed-rod. From 2 to 56 threads per in. can be cut. The weight of the smaller lathe is 2850 lb., and of the larger 3000 lb.





ALL Gears in the Headstock Are Constantly in Mesh. Back gears are mounted in front of the spindle, bringing spindle pressure down against the headstock rather than upward on the bearing caps

Gages Made to Design Committee Standards

PLUG and ring gages that conform in design to the standards specified by the American Gage Design Committee have been brought out by the Brown & Sharpe Mfg. Co., Providence. Each type of gage is made in both "go" and "not go" styles.

Designated as the No. 659, the plug gages are furnished with either single or double-end handles, and in any size or combination of sizes from 0.241 in. to 1.510 in. The "go" gages are easily distinguished from the "not go" gages by their longer measuring surface. All the handles are of hexagonal shape and are finished in black.

The ring gages, known as the No. 664, are available in any size or combination of sizes, from 0.241 to 1.510 in. Rings ranging from 0.241 to 0.510 in. are of two-piece construction with a hardened, ground and lapped bushing inserted in a soft gage body, while the larger rings, sizes 0.511 to 1.510 in., are of solid stock, hardened, ground and lapped to size. The "not go" ring is easily distinguished from the "go" ring by the groove around the outside knurling.

"Go" and "Not Go" Plug Gages in the Double-End Handle Are Shown Below. The "not go" ring gage has a groove to facilitate identification

---

To perpetuate the name Revere in the industry and in the very business which Paul Revere founded in 1801, the Republic Brass Corporation has been renamed Revere Copper & Brass, Inc. The company's plants are located at Rome, N. Y., Baltimore, Chicago, Detroit, and Taunton, and New Bedford, Mass.

During August and September the consumption of gas coal at 125 steel plants was 1,258,053 net tons, against 1,184,448 tons during the corresponding period of last year, an increase of 73,607 tons, or 6.2 per cent, according to the Bureau of Mines.

Portable Air Drills for Production Work

PROVIDED with speeds of 1000, 1500 and 2000 r.p.m., the new E-O portable air drills recently added to the line of the Rotor Air Tool Co., Cleveland, are intended for production operations. They are manufactured in capacities of ¼, 5/16 and ⅜ in.

Unusually light in weight, less than 4 lb. in all models, the machine may be used continuously with minimum fatigue on the part of the operator. The motor develops more than ½ hp.

Unusually Light Weight Minimizes Fatigue

and the compound gearing gives high torque. All models are furnished with grip throttle and a Jacobs chuck.

New 2½-In. Pitch Roller Chain

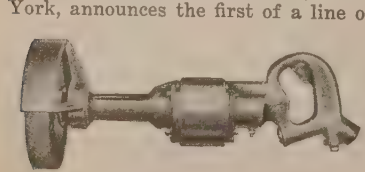
FOR large conveyors, industrial locomotives and other heavy-duty applications the Diamond Chain & Mfg. Co., Indianapolis, has brought out a 2½-in. pitch roller chain.

The Chain Is Made in Single and Multiple Strands

This chain is similar to all of the company's roller chain and conforms to standards sponsored by the American Society of Mechanical Engineers, the Society of Automotive Engineers, and the American Gear Manufacturers Association. The average tensile strength is 95,000 lb. per sq. in., the maximum power rating is 97 hp., and the maximum r.p.m. is 240.

Rotary Pneumatic Grinder

IN the No. 88 grinder illustrated, the Chicago Pneumatic Tool Co., 6 East Forty-fourth Street, New York, announces the first of a line of C.P. pneumatic tools employing the rotary principle.



Either Straight or Pistol-Grip Handle Can Be Furnished

A series of four vanes rotates on a spindle in a casing having suitable opening for the admission and escape of compressed air. High efficiency is attributed to even distribution of air upon the vanes, while reduction of weight is due to simplicity of construction. The machine is governor controlled and is equipped with a removable air strainer. It has a heavy-duty radial and thrust ball bearing on the wheel-end, a removable hardened rotor liner, a ball-bearing rotor, and an automatic oiler in the rotor housing, with adequate grease plugs in the handles and the gear case ends.

The machine is designed to carry an 8 x 1 in. rubber or elastic bonded wheel or a 6 x 1 in. vitrified wheel. Equipped with straight handle, the overall length, with wheel guard, is 22½ in., and the weight 15¾ lb. The pistol grip type grinder is 21 in. long overall and weighs 16¼ lb. The rated speed of both machines is 4250 r.p.m.

Synchronous Motors for Tube Mills

What is said to be the largest single installation of synchronous motors in steel mills is to be made at National works, National Tube Co., McKeesport, Pa., to drive the two seamless tube mills. The motors are being made by the Westinghouse Electric & Mfg. Co., East Pittsburgh.

One mill will have two 3500-hp. synchronous motors to drive the piercing mill and the expanding mill and one 2000-hp. synchronous motor to drive the tube rolling mill. The other mill will have two 2000-hp. motors driving the piercing mill and the expanding mill and one 1000-hp. motor for the tube rolling mill.

The motors will be designed with inclosing covers to prevent dirt and dust from getting into the windings. The covers will be connected with an air-filtering equipment which will clean the air and force it into the motor at a pressure of ⅝ oz.

These motors will be designed with very high peak load ratings, each one capable of a 350 per cent load at frequent intervals. Their windings will be insulated for high temperatures and their load-carrying capacity will be far in excess of any machine that has been used for driving any similar mill.

The trustees of Great Northern Iron Ore Properties have declared a distribution of $2 a share on trustees' certificates of beneficial interest in Great Northern Iron Ore Properties, payable Dec. 28 to holders of certificates of record at the close of business Dec. 6, which will make their aggregate distributions for 1929 total $3.25 a share, as compared with $2.75 a share for 1928 and $1.50 a share for 1927.

Device for Stapling Heads in Barrels and Kegs

MARKED savings in labor as compared with hand nailing are claimed for the Staplit machine illustrated, which is being offered by E. H. Titchener & Co., Binghamton, N. Y., for stapling heads in barrels and kegs. The device is lever-operated and quickly drives nail-pointed square-top staples through the hoop (wood or steel) into the head of a slack barrel or keg. It can be used on a 9-in. keg or a 19-in. barrel without adjustment, and by means of a longer rest (the lower bar), it may be employed on barrels of larger diameter.

In addition to savings in labor, assurance that all staples are driven in the head, the driver being set

permanently to locate the staples at the correct level relative to the top of the head, and elimination of the necessity for head liners are advantages claimed for the device. Pliers or a long handled screw driver may be used to open barrels, the heads being removed without damage, thereby assuring maximum salvage value from barrels and kegs.

The staples employed are made from No. 11 gage steel wire, and are ¾ in. wide and 1 in. long on the inside. They are contained in a vertical magazine which is opened by swinging back the cover, using the short lever at the top, and are fed into position automatically. The staples are cemented together in blocks of 25, and four of these blocks represent a full load—sufficient for stapling the heads in 25 barrels or 50 kegs. The operator can staple the heads from one position, and the staples are driven flush with the hoop, both prongs into the head the same depth.

Paasche Airbrush Co., Chicago, has enlarged its New York sales and service branch, which is now located at 103 Lafayette Street. L. J. Dagon continues as district manager.

Railroads Pledge Heavy Buying

Executives Tell President Hoover They Will Help in Business Stimulation—Large Shipbuilding Work Planned

WASHINGTON, Nov. 19.— Railroad executives of the country at the first of the White House business conferences today gave assurance that they would proceed with full programs of construction and betterments without any reference to the recent stock market decline, it was announced by President Hoover following the meeting.

They informed the President that they would canvass the situation as to further possibilities of expansion and that among the railroads represented, including 11 of the largest lines in the country, it appeared that the total volume of such construction work already indicated an increase during the next six months over the similar period a year ago.

Expressing unanimous determination to cooperate in the maintenance of employment and business progress, the statement said, the railroad executives agreed that the whole question should be taken up at their meeting in Chicago next Friday with a view to securing cooperation of all railroads in the United States in the program.

At that time steps will be taken to canvass the railroads to determine the exact amount of construction and betterments which can be undertaken over the forthcoming year and particularly during the next six months.

The railroad executives, it was added, felt that it was desirable that similar conferences should be called in other industrial groups and that some method of coordination of their different activities should be developed.

While no announcement has as yet been made regarding the shipbuilding program, it is expected that something definite will be arrived at within a few days. Indications are that the Postoffice Department soon will advertise for bids for mail contracts and that these contracts will call for the construction of 15 to 20 ships, with a wide range of capacity, running from 8000 to perhaps 40,000 deadweight tons or more. It is not possible to estimate with accuracy the amount of steel which will be required for these ships, but the tonnage will reach large proportions. Rough estimates have been made that it will approximate 150,000 tons or more, of which about 75 per cent will be plates.

These proposed activities, fitting in with the White House business conferences, are looked to as building up public confidence by expansion of industry and employment and thereby assuring a large purchasing power and continued prosperity. The point has been made that there has been no vital interruption in the economic system of the country. Emphasis also has been placed on the fact that the present situation, unlike previous ones, involves no credit crisis and that capital can be readily turned back into commerce.

Members of the Federal Advisory Council representing the 12 Federal Reserve banking districts in the United States, at a meeting with the President, reported business and banking throughout the country in each district are in a sound condition and that prospects are that money will be available at lower rates, according to a statement issued by Governor Young of the Federal Reserve Board.

Today's conference was the first of a series called by the President to consider the business situation. On account of the death of Secretary of War Good, the second has been postponed from Wednesday to Thursday, while the agricultural group meeting, originally scheduled for Thursday, will take place Friday. The conference with representatives of labor, planned for Friday, has been deferred a few days until a time to be announced shortly by the White House.

These conferences will be followed by others as a means of keeping under way the program of "coordinating business and governmental agencies in concerted action for continued business progress," as stated by the President in his announcement on Friday of last week. It is understood that discussions may be held also with State and municipal authorities whose public works program, together with that of the Federal Government, has been surveyed by the Department of Commerce, the purpose being to release highway, building and other construction contracts along with the awarding of contracts by private industry as a means of stimulating both domestic and foreign business. The President is understood to have been in contact with business leaders of the country ever since the crash in the stock market.

It is believed that reserves of private, as well as public contracts, will be released at somewhat earlier dates than had been contemplated, but it has been made clear that none of the undertakings will be of an emergency character. There have been indications, however, that budgets may be enlarged for public works, that of the Government relating to such activities as building construction, highway development and rivers and harbors work, while State and municipal activities also will deal with the first two lines. It is estimated that total expenditures for public work, as originally planned by the various governmental divisions, would be $1,125,000,000, but it is likely that under the impetus of the present movement to aid the industrial situation the outlay will mount to double that figure. Release of private business contracts is expected to involve a widespread range of activities, affecting all lines of industry and necessarily stimulating capital, employment, and agriculture. Greater shipbuilding activity also is expected to develop.

The delay in proceeding with important undertakings has been held by the President to provide "a substantial reserve for prompt expanded action," which can well be used now that the speculative era has passed and capital has been made available at lower rates of interest for constructive lines. The country has reacted with unanimous and hearty agreement to the view of the President that "any lack of confidence in the economic future of the basic strength of business in the United States is foolish."

That money may now be turned back to business activity was brought out by the President when he said:

"The magnificent working of the Federal Reserve System and the inherently sound condition of the banks have already brought about a decrease in interest rates and an assurance of abundant capital—the first time such a result has been so speedily achieved under similar circumstances."

In connection with the building program, Secretary of the Treasury Mellon announced plans to ask Congress for an increase from the original $238,000,000 to $432,000,000 for the Federal Government construction work to be spread over 10 years. The Treasury's plan calls for the use of $15,000,000 within the District of Columbia and the remainder throughout the rest of the country annually.

The Facts About Pig Iron

J. V. W. Reynders Writes of the Tariff Situation and the Status of the Blast Furnace Industry

SOME of the daily newspaper comment on portions of the pending tariff bill has gone wide of the mark. It was fortunate that the New York *World* editorial of Nov. 9 on the pig iron tariff came under the eye of John V. W. Reynders, 120 Broadway, New York. His comment, addressed to the editor of the *World* and given below, covers the ground admirably, while the original editorial illustrates how far the average reader may be led astray in his judgment of conditions in industry:

"The *World* editorial Nov. 9 entitled 'Pig Iron and Protection' is based on so complete a misconception of the relation of the pig iron duty to the steel industry that a correction seems in order.

"You say that 'this is the most important reduction yet voted and is one on which the coalition may well go before the country.' As a matter of fact the argument of the coalition would not be against the steel industry but against certain isolated blast furnaces located in the seaboard States that have to meet not only the competition of foreign iron but also the surplus production of steel works which regard pig iron made for other than their own use merely as a by-product.

"Of the production of 36,700,000 tons in 1925 mentioned in your editorial, 27,700,000 tons was converted into steel in the plants of the makers, invariably in a molten state. This metal is in no wise affected by the duty, as foreign iron could not be put into a molten state at anything like the amount of the duty.

Of the remaining 9,000,000 tons 75 per cent is produced in the interior, where freight charges from the seaboard afford more than ample protection. Therefore the imports of Indian iron—viz., 184,000 tons—constitute a decidedly greater 'menace' than one-half of 1 per cent. The total imports in 1925 from all countries, including India, exceeded 500,000 tons, being more than 22 per cent of the production of so-called merchant iron made in seaboard States.

"Specifically, the duty determines the successful operation of furnaces located at such points as Port Henry, Standish and Troy, N. Y.; others at Everett, Mass.; Chester, Pa., and Ironton, Utah, etc. There could have been no appeal to Mr. Coolidge in 1927 on behalf of steel companies to increase the pig iron duties by 37½ cents a ton. This amount would be insignificant from the point of view of disposing of a by-product. On the other hand, the independent furnaces had every reason to appeal for help, and the fact that their appeal was heard is far from involving a 'rebuke to Mr. Coolidge.' Each ton of merchant pig iron requires nearly two tons of coal in its production and a like amount of iron ore. It provides protection indirectly to these related industries, as well as supplying traffic to the railroads in the relation of five tons to every ton of iron produced.

"Nothing is gained in the building up of our industrial activities by creating erroneous impressions in so involved a subject as the tariff. The pig iron duty was not instituted to increase the profits of the big interests. It is one of the molehills out of which politicians make mountains."

Weirton Steel Plans $7,000,000 Expansion

Program Includes New Type Mill to Roll Diversified Hot-Rolled Products—Ingot Capacity to Be Enlarged

THE Weirton Steel Co., Weirton, W. Va., subsidiary of the recently formed National Steel Corporation, will begin the manufacture of heavy hot-rolled steel products with the completion of a new diversified continuous mill, plans for which are now being completed by Weirton engineers.

According to an announcement by E. T. Weir, chairman of the board of both the Weirton and National companies, the mill will be part of a $7,000,000 expansion program now being inaugurated at Weirton, which will be largely completed by the end of 1930.

The new mill, which will have a monthly capacity of from 25,000 to 30,000 tons, depending upon material being rolled, will embrace many innovations in design, most of which are calculated to give it greater diversity. It will be capable of rolling rails, structural shapes, rounds and squares, and railroad track accessories, including splice bars, tie plates, etc.

The expansion program also includes the addition of about 40 by-product coke ovens, which will increase the Weirton coke capacity by about 50 per cent. The No. 2 blast furnace at Weirton, which is now out for relining, is being enlarged slightly and, when blown in on Nov. 28, it will have a capacity of about 900 tons daily. The older No. 1 blast furnace will be blown out in the near future for rebuilding, and, when completed, will have a capacity of 1100 tons daily, making it probably the largest furnace in the United States.

The company's open-hearth capacity will also be gradually increased with the enlargement and modernization of the first five open-hearths that were erected at Weirton. Their capacity will be increased from around 175 tons daily to between 250 and 300 tons, which is the capacity of the seven more modern furnaces at Weirton. This will give the plant at Weirton an annual capacity of approximately 800,000 tons of by-product coke, 700,000 tons of pig iron and 1,300,000 tons of steel ingots.

Mr. Weir states that the new plant of the Great Lakes Steel Corporation, another subsidiary of the National Steel Corporation, at Ecorse, Mich., near Detroit, probably will be in operation by July 1, 1930. In the meantime, the Detroit blast furnaces of the company's Hanna furnace division are being enlarged and modernized and will be equipped to supply hot metal to the open-hearth furnaces at Ecorse.

Alan Wood Steel Co. Leases New Jersey Mines

The Alan Wood Steel Co. has leased from the Warren Foundry & Pipe Co., for 15 years, the Replogle and Oxford iron mine properties in New Jersey. The purpose of the lease is the establishment of a source of iron ore supply for the steel company's blast furnaces at Swedeland, Pa. It is the intention to put these mines on a production basis as soon as the necessary repairs and modifications in the milling arrangements can be completed. The actual operation of these properties will be carried on by Alan Wood Mining Co., a corporation recently organized for this purpose.

Bethlehem-Steel Corporation Suit Settled

James A. Farrell, president, United States Steel Corporation, and E. G. Grace, president, Bethlehem Steel Corporation, have announced that the suits recently brought by Bethlehem Steel Co. against United States Steel Corporation and certain of its subsidiaries, involving an alleged infringement of patents covering the manufacture and sale of broad-flange sections, have been settled under an arrangement by which United States Steel Corporation and its subsidiaries have been licensed to manufacture and sell such sections under the Bethlehem patents for the remainder of their terms—from 12 to 16 years. The suits are to be discontinued.

Iron and Steel Basket Clause Rate 40 Per Cent

WASHINGTON, Nov. 19.—In its table on page 1318, THE IRON AGE of Nov. 14 gave the iron and steel basket clause tariff rate adopted by the Senate as 45 per cent. It should have read 40 per cent, the Senate having cut the Finance Committee rate of 45 per cent. On page 1319 of the same issue the increased revenue on manganese ore arising from the Senate action of reducing the dutiable grade to 10 per cent was given as $33,600 annually, based on imports of 1928. This should have read $336,000.

Westinghouse Initiates New Pension Plan

Annuity Payment System Guarantees Substantial Incomes for Retired Employees

EMPLOYEES of the Westinghouse Electric & Mfg. Co., East Pittsburgh, who retire at the age of 65 years or older, will be guaranteed substantial incomes for the remainder of their lives as the result of the institution of a new and scientific annuity payment plan, which will affect all of the 50,000 workers on the Westinghouse payroll. Its coverage, reckoned after the manner of group insurance, will be $54,000,000 at the start and $14,500,000 annually thereafter.

Under the Westinghouse plan, which was drafted by Dr. Henry E. Jackson of the Social Engineering Institute, New York, an employee not only receives from the company an earned reward for length of service, but also has an opportunity to buy additional retirement income for himself at a favorable rate. One of its distinctive features is that it offers no obstacle to the employment of older workers, as every employee reaching his retirement age receives his proportionate retirement income. The company's part of the plan's cost will be paid as a regular operating expense, the same as wages and repair costs. The plan sets up a contractual agreement which binds the company to do its part irrespective of what employees may do. Employees will be encouraged, but by no means obliged, to participate in the plan.

At the expiration of every year of service, the employee will receive an annuity certificate entitling him to a number of units of income after retirement. Every retirement income unit will yield one dollar a month beginning at retirement age and lasting for life. The number of units the employee receives annually will depend on his salary or wage. If he wishes, the employee can make his annuity income payable to himself and wife as long as either may live.

"A notable result achieved by this method of drafting the plan," according to Frank A. Merrick, president of the company, is that the hitherto unsolved problem of accrued liability has been eliminated and the uncertain and increasing future cost has been replaced by a known level maximum cost for the entire future. The retirement problem has been solved permanently and inexpensively. The net annual cost of the plan to the company is estimated to be 1.2 per cent of the payroll and by the use of a new budget method the net cost is automatically exhibited every month."

The company's part of the plan will be operated under a deed of trust administered by a board of trustees, with a bank acting as custodian of the funds. This board is composed of Mr. Merrick; J. D. Callery, director of the Westinghouse company and president of the Diamond National Bank, Pittsburgh; T. P. Gaylord and J. C. Bennett, vice-presidents of the Westinghouse company, and J. W. Thompson, vice-president and trust officer of the Union National Bank, Pittsburgh. The employee part of the program will be underwritten by the Equitable Life Assurance Society of the United States.

A striking feature of the plan is that no matter what might happen to the company in the future, those employees who have been retired are assured of receiving their retirement income for life, because cash for this purpose is irrevocably turned over by the company annually to the board of trustees, and in addition a reserve is built up by annual payments to the trustees for those approaching retirement age. With this retirement income system supplementing relief and insurance systems, Westinghouse employees are now protected to a large degree from the three great economic hazards of death, disability and dependence in old age.

No Time to Force Business, Says George M. Verity

"As regards business, the recent drastic decline in the stock market will naturally affect business as a whole to a greater or less extent. Some lines will, of course, be affected more than others. It is certainly not a time to attempt to force business," said George M. Verity, president, American Rolling Mill Co., when interviewed by THE IRON AGE on the current status of the steel trade.

"If industry really wanted to help itself at this time it could not do better than to call off all its salesmen and send them off on a vacation, if necessary. This would aid the consumer in quietly using his inventories and in gradually reaching a time when he has to buy.

"I have never known it to fail, when a business depression occurred, no matter what the cause, that in proportion to the length and depth of the recession a reaction is in due course sure to follow. It usually comes stronger than is expected, for the simple reason that stocks have been depleted and, when business begins to be active again, the buyer must not only cover his current needs, but must build up his inventories again.

"This is no time for pessimism. It is a time for courage and a display of our confidence in the fundamental soundness of things.

"The world moves on irrespective of life and death, of the immediate curve of business activity or the gyrations of our securities markets.

"Business activity, like water, always seeks, and sooner or later finds its level. Nothing short of a five-year period shows the general trend."

Atlantic Steel Reports Sound Conditions in South

The Atlantic Steel Corporation, Atlanta, Ga., has declared an extra dividend of $2 a share on the common stock at a meeting of directors on Nov. 13. This is in addition to the regular dividend of $1.50.

"This action was taken after a careful review of the operating results obtained in the first 10 months of this year," said Robert Gregg, president. "It was the view of the directors that conditions in the company's trade territory were on a sound basis, as shown by the volume of buying for current and near-future needs. Inventories throughout the territory seem to be low and at very reasonable prices, making for a thoroughly sound position of all buyers and users of steel products. The directors were of the opinion that the present sound economic conditions in this territory would not be adversely affected by current fluctuations in the New York stock market."

Plans Perfected for Manufactures Census

Cooperation of Industry to Be Sought Through 17 District Conferences, Which Will Be Broadcast

PLANS are being laid to insure prompter and more accurate returns in the coming decennial census of manufacturing operations. Under the chairmanship of Col. L. S. Horner, president, Niles-Bement-Pond Co., New York, the Advisory Committee on Manufacturers appointed by Secretary Lamont last summer has arranged to make a thorough-going campaign to arouse general interest in the work.

The United States has been divided into 17 districts. Every community of any size in each of these districts will be card-indexed, and the local trade association and service clubs within 100 miles of a central city will be asked to send delegates representing local manufacturers and distributers to a conference. Communities outside the 100-mile limit will be reached through correspondence.

To Confer on Friday

The first of these conferences, which are being arranged under the direction of John E. Palmer, will take place Nov. 22 at the Pennsylvania Hotel, New York. Addresses will be delivered by Dr. Julius Klein, Assistant Secretary of Commerce; Col. L. S. Horner; F. M. Feiker, chairman of the Advisory Committee on Distribution, and W. M. Steuart, director of the Bureau of Census. The speeches will be broadcast over the Columbia-National network. Conferences will be held in other cities as follows:

Nov. 25—Bellevue Stratford Hotel, Philadelphia.
Nov. 27—Atlanta-Biltmore Hotel, Atlanta.
Nov. 29—Statler Hotel, Detroit.
Nov. 30—Hotel Statler, Buffalo.
Dec. 2—Hotel William Penn, Pittsburgh.
Dec. 4—Statler Hotel, Cleveland.
Dec. 5—La Salle Hotel, Chicago.
Dec. 7—St. Charles Hotel, New Orleans.
Dec. 9—Jefferson Hotel, Dallas, Tex.
Dec. 11—Statler Hotel, St. Louis.
Dec. 12—Fontenelle Hotel, Omaha, Neb.
Dec. 14—Brown-Palace Hotel, Denver.
Dec. 17—Olympic Hotel, Seattle, Wash.
Dec. 19—Claremont Hotel, San Francisco.
Dec. 20—Los Angeles Biltmore, Los Angeles.
Jan. 4—Boston Chamber of Commerce, Boston.

Representatives at the conferences will learn the practical value of the censuses to their communities and the methods used by other communities in assembling data both on manufactures and distribution. They will be asked in turn to do five things: First, give the local papers a report of the district conference; second, keep the local papers informed of local and national developments of the census work; third, organize a meeting of local manufacturers about the middle of January, to be addressed by a speaker furnished by Mr. Palmer; fourth, organize a meeting of local wholesalers and distributers about the middle of April, to be addressed on the census of distribution, and, fifth, to deliver a short talk over the local radio.

Cooperation to Speed Results

Through these methods the Bureau of Census hopes to expedite action so that reports on production operations will be available to the bureau at Washington by the middle of February. This would enable the bureau to deliver the basic data back to manufacturing industry within six months. In addition, the bureau believes that many thousands of dollars will be saved to the Government through more accurate returns and a reduction in field work.

Contractors See Benefits from Stock Deflation

Stabilization of the stock market at moderate levels and a recession in the volume of stock speculation should have a beneficial effect on the volume of construction contracts awarded, in the opinion of the Associated General Contractors of America. This organization says:

"The decline in contract awards evidenced so far this year by a 25 per cent reduction in the commitments for residential construction, as shown by the statistics of the F. W. Dodge Corporation, is seen as a result of difficulties in arranging for financing. With funds from all over the country actively employed in stock speculation, financing for local construction has been difficult to secure, especially for apartment house and hotel construction, it is claimed.

"This recession in residential construction contract commitments has only just begun to affect the demand for labor and construction materials, according to a statistical study just completed by the Associated General Contractors. The volume of construction job activities during October as indicated by shipments of basic construction materials declined 26 points to index number 233. Despite this drop in October the level of job activities during the first 10 months of 1929 was only one half of 1 per cent less than the volume of activities for the same period in 1928.

Carry-Over of Contracts

"The maintenance of job activities in the face of a recession of contract awards is accounted for by the existence of the carry-over of uncompleted contracts into this year. Unless financing soon becomes available for contemplated residential construction that is being held up it is believed that the volume of construction activities will recede to levels proportionate to the volume of contract awards.

"Outside the residential field contract awards are shown to be slightly above the totals of last year so that recovery in this one field of the industry will allow construction activities to be maintained at levels equal to those of the past. As recovery in residential contract awards is seen to be dependent upon the stabilization of the stock market and the release of funds for building financing, construction circles do not view the recent collapse of the stock market as an unmitigated calamity."

Foundry Equipment Makers Busy

Foundry equipment orders for October are reported at 245.3 on the basis of 100 as the average monthly shipments for 1922-1923-1924. Deducting cancellations, the net orders are 240.3, as reported by the Foundry Equipment Manufacturers Association. Shipments are given as 214.1 and unfilled orders as 492.5. The three-month average of gross orders was 230.3.

The index of gross orders for October was the highest since August, 1928. With the further exception of May, 1928, it was the highest on record. The three-month average was the highest ever recorded, exceeding the 218.7 of a month earlier by 5 per cent.

Shipments were the highest since last May, but were considerably lower than in October of last year. Unfilled orders were, with one exception, the largest on record. That exception was September, 1928, when 529.5 was indicated. September, 1929, had shown the previous second highest record in unfilled orders.

Employment and Payroll Totals in Identical Plants in September and August (a)

	Establishments	Number on Payroll		Weekly Payroll (b)	
		September	August	September	August
Iron and steel	201	280,559	284,312	$9,085	$9,239
Foundry and machine shop	1,065	290,719	289,499	8,860	8,929
Machine tools	150	42,577	41,418	1,387	1,326
Hardware makers	69	31,951	30,965	821	800
Steam and hot-water appliances	109	32,581	32,311	961	936
Stoves	114	20,982	19,771	587	539
Structural ironwork	173	30,068	29,795	930	916
Cast iron pipe	38	11,954	11,926	286	286
Automobiles	217	435,914	442,989	14,355	15,280

(b) Thousands of dollars.

This Issue in Brief

Two good years, then one bad. The cycle that appeared in the late pre-war years has reappeared since the post-war boom. Economist says 1930 looks like a dull year, but there is "no reason as yet to forecast a serious business depression."—Page 1373.

* * *

Welding costs can be cut by teaching welders to work faster, using larger flames, decreasing the angle of vee, and keeping the weld narrow.—Page 1385.

* * *

Reduces oil consumption about 2 gal. to the ton of steel by superheating the steam for atomization to 700 or 800 deg. Fahr.—Page 1384.

* * *

Annealing improved sometimes by slight oxidation, says engineer. Oxidizing gases are under absolute control with electric furnace. Superiority of results, he says, offsets higher cost.—Page 1387.

* * *

Zinc spraying competes strongly with galvanizing in Europe. Protective skin of zinc oxide is formed speedily by treating sprayed coat with sodium chloride. Resistance to sea water and air corrosion is very high.—Page 1371.

* * *

Welded building cost $8 a ton more than riveted, says riveting machine manufacturer. Make walls sound absorbent, to escape din of riveting.—Page 1381.

* * *

New market for malleable castings. Withstand successfully both laboratory and service tests, proving that uses for malleable iron need not be restricted to small castings.—Page 1364.

Discovery may cause important change in open-hearth practice. Amount of iron oxide dissolved in liquid steel is much higher than heretofore supposed. Emphasizes necessity for more careful study of deoxidizers.—Page 1366.

* * *

Tungsten carbide "tipping problem" solved. Copper brazing in hydrogen atmosphere has proved satisfactory in most uses. If welded on, the tungsten carbide may crack. Better let the tool material manufacturer do the tipping if you have little to do. —Page 1369.

* * *

Stock crash due to absence of "short" cushion, economist suggests. Persistent upward course of prices drove the short seller out of the market, so there was no cushion to break the force of the panic.—Page 1372.

* * *

Metal-spraying with aluminum, tin, copper and lead presents problem of pores in the coated layer. Best results are obtained by treatment with chemicals which react with the metal.—Page 1371.

* * *

Flaw detector not always accurate, says railroad man. Can not be called highly successful, he says, but method is promising. He used early model, says detector maker; present model is better.—Page 1366.

* * *

Intermittent cuts can be made with tungsten-carbide tools if extreme rigidity prevails. Surround and reinforce the carbide insert on all sides, where it would normally be in tension. It has great compressive strength, but little tensile strength.—Page 1370.

Assemblers work faster if wheels are put on last. Durant waits until all assembly work is done before adding wheels, so that assemblers are not hindered. —Page 1374.

* * *

Lone manufacturer will lose in business struggle, says trade association manager. Urges fabricators to unite forces and extend facilities in battle for markets. —Page 1380.

* * *

Architects "discover" white metal. Large quantities are used in new business buildings. Monel and rustless iron are used, but aluminum and its alloys lead.—Page 1361.

* * *

Grinding tungsten-carbide tools no longer a problem. Best results, Dr. Jeffries believes, are obtained by using artificial abrasives of the silicon-carbide family, such as carborundum or crystolon.—Page 1369.

* * *

To speed the cleaning of the molten steel, add ferromanganese ahead of the ferrosilicon. With deep bath, it might be better to kill the steel in the ladle instead of in the bath.—Page 1383.

* * *

Aircraft fuselege welds, pickled in acid for 24 hr., get 100 per cent rating. No cracks or other weaknesses visible under magnifying glass. Tension tests of joints showed full rated strength. —Page 1386.

* * *

Wire-drawing die costs cut in half by tungsten carbide. Ratio in saving in die cost better than 2 to 1. With smaller wire, overall improvement in cost compared with diamond die was 6 to 1.—Page 1369.

Propaganda Out of Order

THE present is no time for propaganda. Publicity and advertising containing obvious misstatements regarding the current state of business do not delude; they may only accentuate the lack of confidence they are intended to dispel.

The aftermath of the stock panic has enough encouraging features without drawing on the imagination. There is no credit strain; on the contrary the Federal Reserve ratio is high and New York discount rates have been reduced twice since the stock market landslide started. Commodity prices are not inflated and business is not burdened with swollen inventories built up at high prices.

These fundamentally strong factors help explain why the country has remained free from wholesale cancellation of orders, sharp breaks in commodity markets, widespread closing down of plants and correspondingly large increases in unemployment, such as were immediate sequels of other stock market crashes.

The situation has much in it that is heartening; but business men know that nothing is to be gained by ignoring the unfavorable side of it. Among the adverse factors are the large quantities of frozen funds tied up in securities, and recently increased to save margins, which will reduce consumer buying power as effectively as actual monetary losses in speculation. Some of these accounts, moreover, threaten to cause further liquidating movements, so that an uncertain, fluctuating stock market may persist for some time to come.

It is also recognized that installment buying will be subjected to severe test, although conservative opinion is that defaults on payments will not become serious unless unemployment assumes alarming proportions. Happily, constructive measures set in motion by President Hoover will do much to ward off that danger. Corporations with large cash reserves—and there are many of them—are able, and with Government encouragement are expected, to initiate undertakings that will provide work for large numbers of men. Similarly Federal public work is likely to be accelerated, and there are indications that State and municipal projects will be expanded and expedited.

Much can and will be done to tide the country over the period of readjustment that it faces. There is no reason for pessimism. On the other hand, it would be too much to expect a continuation of flush times, which got so much support from lavish purchases out of stock market profits.

Reappraising the "New Era"

DURING the last seven years of activity it has been said repeatedly that we were in a new era. The catastrophe of the stock market raises several questions about this. Was it really a new era and if so has the era ended? No categorical answer can be given to either of these questions. There is much that is new, easily distinguished as such; but the problem is to distinguish between the new things that seem permanent and those about which there is either doubt or a certainty that they have dropped out or will.

The public was disposed to take it that nearly everything new that appeared in the industrial and economic situation was permanent and now it has found that one thing in which it took great interest, advancing stock market values, was not permanent. A reappraisal is accordingly necessary.

In the reappraisal we can reduce various things to fundamentals and thereby segregate what is permanent from what is not. The efficiency we attained in the war and the enlarged views of what we can do are permanent. The better understanding between employers and employees and the better treatment are permanent. So also is the belief that well paid labor is a first essential to maintain consumption. Realization of the value of research is permanent. The higher standard of living is permanent, and no error can be made about that because we have the testimony even of the past. Burton, in his classical "Crises and Depressions" published in 1902, says that the people always emerged from a period of depression with a higher standard of living than they had previously enjoyed. There was no going backward except temporarily even in the old order of things which we know is largely altered.

Next we have a matter not so simple. We do learn something by experience. It was before the war that there came recognition of a periodicity in our ups and downs in business. Foreseeing that there might be a panic in 1913, following those of September, 1873, and June, 1893, some men made preparations. There was already some recognition that the cycle was not necessary; the accuracy of this statement is indicated by reference to editorials in THE IRON AGE, Dec. 4, 1913, "The Cycle and the Iron Trade," pointing out that a previous parallelism had broken down; Sept. 17, 1914, "Cyclical Depression—an Obituary"; Oct. 1, 1914, "The Lost Panic of 1913."

Since the war much more statistical and other information has been available and there has been more

thinking. We may assume, if not as an absolute fact at least as a good working hypothesis, that business men avoided excesses and that thus the familiar cause of reaction and depression was avoided. That carries us up to the recent portion of this seven-year period of activity. The boom in the stock market and its influence upon general trade is the new thing that is not permanent, for it is even now gone; it is also chief of the unfavorable economic features of the "new era." Thus there must come a readjustment following the speculative excesses of these many months. From giving thought on a scale wholly without precedent to getting gains by stock speculation, millions of our people will now have a new respect for the old-time practice of working and saving and of buying for investment.

In Dispraise of Corrugated

SIGNS multiply that architects, artists and designers are paying more and more attention to metal and are developing the aesthetic possibilities of this medium at a rapid rate. Of course we have inherited many beautiful objects worked in metal in years gone by, such as bronze statues and ornamental iron grilles, not to mention productions of silversmith, armorer and jeweler. But we are now discovering that inlaid or embossed metal can enrich the interiors of public buildings and offices; that even so prosaic a thing as a kitchen sink can be good-looking as well as convenient.

No little credit for this is due to progress in the metallurgical industries. New metals and alloys, ductile yet stainless steels, have been produced at a moderate cost and with beautiful and durable surfaces. Gas welding and metal spraying enable the artisan to execute readily designs formerly all but impossible.

Secretary of the Treasury Mellon recently summarized very aptly the reasons underlying this trend toward art in industry when dedicating a monumental structure to be used as a railroad station. He said, "It is a bad investment to build anything that does not conform to those standards of good taste that have stood the test of time." Such sentiments would probably be pooh-poohed by a group of emancipated artists of the modern school. A cubist given free rein erects a building like the glass and metal church at Cologne, which really looks like a fantastic greenhouse. If he built a bridge, it would probably violate so many principles of engineering that it would rapidly emulate the celebrated London bridge of our childhood game. Yet bridges, even of steel, can be harmoniously blended to the surrounding landscape without relying upon the newest of the new art, as is proved by a series of photographs recently published by the American Institute of Steel Construction. A glance through them indicates that they are nearly all low sweeping arches or suspension bridges, suggestive of the lines of the Allegheny River bridge at Pittsburgh, recently voted the most beautiful bridge built during 1928.

A bridge builder must use his metal practically without ornamentation; an architect has the opportunity not only to achieve a distinctively American form for tall buildings, but is able to use new materials for their ornamentation. He wishes to accentuate the vertical lines, so he uses lead or aluminum spandrels between the windows. Bold ornamentation of the structure he reserves for the top; so he uses gigantic figures cast in bronze or aluminum, or sheathes a tower in glittering white metal. Façades, extending up a few stories, entry halls and elevators —parts of his building seen close up—he trims with copper, bronze, monel, or stainless steels, either in plain moldings, fret work, inlay, or bas relief. Costly woods he replaces by more durable yet equally appropriate metals for interior decoration and even for furniture.

Enthusiastic though we are about this new trend in architecture, an involuntary protest arose recently when called upon to admire a pedestrian bridge in Chicago, sheathed entirely with a polished iron alloy, for all the world like shiny corrugated iron. And now comes a drawing of the 100-story office building proposed by the Metropolitan Life Insurance Co. It looks as though some one had got an enormous roll of corrugated strip and pulled the central coils out to get an ascending spiral, as Doré would have conceived the Tower of Babel, but with surfaces fluted vertically. "Instead of placing windows occupying, as is customary, less than 50 per cent of the whole surface of the building and recessing these windows within masonry reveals," says the architect, "the entire surface between the steel supports will be made of metal and glass, these surfaces being projected somewhat like a shallow bay window, glass being carried to ceiling level to give the maximum light."

We can admire corrugated iron on a roof for its durability, or on the siding of a mill building for its utility, or a corrugated building for the amount of metal on its surface; but something prevents us from seeing anything beautiful in it. Perhaps it is a case of artistic astigmatism.

An Instrument of Market Expansion

AS an agency for the development of markets, including the discovery of new fields of consumption, the trade association has well proved itself in the case of the steel fabricators' organization. As brought out in the report elsewhere of the annual meeting of this body, the short space of seven years has shown an astonishing growth of influence. City after city has accepted, in whole or in part, its recommendations for steel building work. The professional and business world likely to be interested has been fairly flooded with steel building literature. The stamp of authority based on results seems unquestioned. Aggressive studies to find new uses for structural steel have uncovered definite items. Steel deck floors, even for residences as well as multi-storied buildings, promise an outlet for even a greater tonnage of plates than is absorbed for railroad cars. The attitude of the institute's staff is that steel is an excellent material for many forms and sizes of dams, or it intends to know why not.

In respect to business practice, the association has composed many differences among the member companies. It has established standard specifications and a code for the industry and it has published a sales manual and directed sales meetings of member representatives. Its membership was instrumental in furthering a trade practice conference instituted under

the auspices of the Federal Trade Commission. In a word, the institute has done all that could reasonably be expected from a trade association, especially considering its short existence.

One outstanding problem which it has not solved is a basis of relations with the producers of structural shapes—the suppliers of its major raw material. The signs are that the steel makers have come to regard highly the efficacy of the institute and are in a mood to cooperate more fully than in the immediate past, and this means, of course, in the way of a sizable money contribution to further the work of promoting consumption. The immediate need seems to be for group action by the steel producers for an equitable apportionment of the support. That they are favorable to some joint action is taken for granted. What seems to be lacking is the machinery to set up a negotiating organism; but as the will grows to foster the movement, the way will be found.

Prospects for Exports of Capital

FOLLOWING the decline in interest rates and the reduction in collateral loans it is natural to expect an increase in the flow of American capital into foreign investments. This, however, would be merely a reversion to the practice prior to about the middle of 1928, which means two things—that it is likely to occur and that it will have no great long-range significance.

At the beginning of last year interest rates were low. They advanced somewhat during the first half and sharply in the second half while the stock market underwent a great advance. The offering of foreign securities showed a great decrease at the middle of last year, and that was not seasonal. Of the total offerings in 1926, 45 per cent were in the first half and 55 per cent in the second half; in 1927 there was a 50-50 division, and in 1928 the division was 70 per cent first half and 30 per cent second half. Thus far this year the offerings have undergone a further decrease.

In 1923 there was a sharp dip in these offerings, there being a fairly steady increase thereafter. Offerings in the first half of 1928 were at a rate 32 per cent above the 1927 total and 59 per cent above the 1926 total. In the second half of 1928 they were only 55 per cent of the rate during the preceding two and a half years, and this year have been running lighter still.

During this former period there was much criticism of our lending so much money abroad and now if the practice grows again there may be repetition of the criticism. There is an outstanding fact in this matter observable without analysis in detail—that whereas the critics predicted cumulative ill effects the passage of time with increasing loans abroad did not strengthen their case.

The exhaustive compilations and estimates of the Department of Commerce published annually in "The Balance of International Payments of the United States," the last issue covering data through 1928, show how many offsetting items there are, whereby the billions of dollars frequently cited as representing our loans abroad are greatly scaled down. How large and complicated is our account with the outside world is shown by the fact that for 1928 the debits and credits each totaled over ten billion dollars, whereas the net capital movement is computed at only 962 millions.

With the cumulative experience of several years it is found that the thing has not become top-heavy, for it is fair to assume that the decrease in lending abroad which occurred at the middle of last year was due to money rates and stock speculation. Without going into details of various counterbalancing items, the finding of the Department of Commerce in the last presentation, up to the end of last year, may be cited: "The American nation having now seen five or six successive years in which the par value of foreign capital issues was over a billion, it is rather surprising that during the seven years ended with 1928 our net export of capital was only $3,253,000,000" as estimated, and this would be reduced to $2,982,000,000 if receipts of principal on the war debts to the United States Treasury were considered.

Both by reason of the change in money rates and stock speculation and of the need for stimulating exports the prospect is that there will now be a return to the practice of lending what seem like large sums abroad. Even at this late date harmful results have not become visible. True, it might look better if we had need for all our capital at home, but we seem to have a sufficient supply for both home and foreign interests.

Suggests Remedy for Enamel Blisters on Cast Iron

INVESTIGATION of a problem which has caused a good deal of worry to manufacturers of enameled cast iron ware has been completed by the Bureau of Standards after several years' study. It had been found for a long time by different manufacturers that certain irons showed a pronounced tendency to the formation of blisters in the enamel. This had come to be associated finally with different kinds of cast iron. For example, Southern cast iron was said to be "non-blistering," whereas Northern cast iron of essentially the same composition was classed as "blistering." The problem has been a very obscure one and a great many false leads have been followed.

According to the report, the blistering tendency cannot be ascribed to any particular composition. Blistering is dependent upon the presence of a thin surface film of chilled metal which may exist even in ordinary castings. The carbon in such a "micro" chilled layer is in a condition very favorable to the formation of the gas which gives rise to the blisters in the enamel when it is fired. The remedy is simple and efficient. It consists in the removal of the surface of the casting before enameling, preferably by sand blasting.

Central Alloy Increasing Stainless Steel Capacity

Current output of stainless steel by the Central Alloy Steel Corporation is the highest since production of the new material was started under Krupp license, it is announced by Chairman F. J. Griffiths. Notwithstanding larger production, deliveries of stainless are from six to nine weeks behind orders. Demand has been increasing rapidly with the development of new markets in the automotive, pipe, building and many miscellaneous lines.

In order to supply demand for stainless steel, the company is expanding productive facilities as rapidly as possible, Mr. Griffiths said. Latest steps in the expansion program include installation of an automatic pack furnace, five double cabinet sand blasting machines, a double tank mechanical pickling machine and a 2500 cu. ft. air compressor. In addition, a new 25-ton electric furnace is being constructed. Completion of these improvements around the first of the year will enable the company greatly to increase production.

Newport Naval Station to Sell Scrap Tonnage

Bids will be opened Dec. 5 by the United States Naval Torpedo Station, Newport, R. I., on a tonnage of iron, steel and non-ferrous metal scrap. Material to be sold includes 150 net tons of mixed borings and turnings, 100 tons of miscellaneous iron, steel and non-ferrous metal scrap, 110 metal drums of 50 to 55-gal. capacity, 73,000 lb. of brass, copper and bronze scrap, 4000 lb. of monel metal scrap, 1000 lb. of bronze dross and skimmings and 123 grinding wheels.

Record Iron Ore Shipments Through Sault Locks

Shipments of iron ore through the Sault locks this year has set an all-time record, according to the monthly statistical report of the United States Engineer's office. The total to Nov. 1 was 17,457,000 tons greater than during the entire season's total of any previous time, including shipments during the period of the World War.

To Build Suspension Bridge of 4500-Ft. Span

A bridge with towers exceeding the height of the Woolworth Building in New York will be constructed in commemoration of the American soldiers who fought in France, according to D. B. Steinman, consulting engineer, in an address Nov. 13 before the seventh annual convention of the American Institute of Steel Construction, meeting at Biloxi, Miss. Doctor Steinman reviewed the past 50 years of bridge building, years during which steel has been available, and described some of the most massive bridge structures in the world.

The Liberty Bridge, across the Narrows on New York Harbor, he said, will be 4500 ft. between the main piers and 235 ft. above high water. The main span of the proposed bridge will be 1000 ft. longer than the main span of the Hudson River Bridge, now building, which, in turn, is nearly twice the span of the next greatest bridge.

Each tower will be 800 ft. high. The main cables from which the bridge is to be suspended will measure 48 in. in diameter, each containing 48,000 wires, and the strength of the wire will be 240,000 lb. to the sq. in. The towers will be artistically designed in steel and unadorned, he said, and the whole structure will express the "Spirit of Steel." Observation platforms will crown the towers, which will be equipped with a carillon of bells and with beacon lights.

—

Doubt has been expressed that such a bridge would ever be built, inasmuch as the city has authorized construction of a tunnel under the Narrows to carry traffic between Staten Island and Brooklyn.—EDITOR.

The Week in Business

Drift of Current Financial and Economic Opinion

INTEREST in post-mortems is waning. With marked adaptability the American public is readjusting itself to the conditions imposed by a major stock market panic and is already seeking practical ways of minimizing their effects on business.

That serious havoc has been wrought is commonly recognized. As observed by Col. Leonard P. Ayres, a shrinkage in stock market values exceeding our entire expenditures and loans during the World War cannot fail to cause widespread and serious actual losses to thousands of people, wiping out large savings and creating a vast volume of unproductive indebtedness.

But, as is well put by Theodore H. Price, *Commerce and Finance*, "Business in America has become an enormous force. Any serious diminution in its volume seems to be unlikely, and the distress that the recent panic has caused will be forgotten just as soon as hope again takes possession of this hopeful people."

Government Action Salutary

Nothing has done more to inspire hope and restore confidence than the constructive measures undertaken by the Federal Government. The assurance of prompt action to reduce income taxes 1 per cent on both corporations and individuals is hailed as a welcome measure of relief by the *Commercial and Financial Chronicle*. The tax cuts, it declares, "are sure to prove a stimulus to trade, whether trade is to remain good or take a turn for the worse."

Of far greater immediate promise are the conferences of business leaders called this week by the President to formulate plans for offsetting business reaction. The cash position of important corporations is excellent, warranting the release of projects to provide employment. What is more, the Government itself is preparing to speed up Federal work and to encourage shipbuilding through loans and mail contracts.

No Disastrous Sequel of Crash

With this organized remedial effort under way, it is gratifying to note that results of the stock market collapse to date have not been alarming.

"We are already able to say," writes Alexander D. Noyes, New York *Times*, "that there has been no shutting down of business houses, no crash in prices of manufactured products, no sweeping reduction of working forces, such as occurred in immediate sequence to nearly all of the older Wall Street panics. Prices of staple goods fell 10 per cent in the weeks of the 1920 panic; a week or two after the panics of 1907 and 1893, manufacturers were discharging employees by regiments."

Credit Easy, Commodities Uninflated

Freedom from credit strain and absence of commodity price inflation are the two outstanding characteristics distinguishing the recent stock market break from other Wall Street crises, and they indicate a basically sounder condition of finance and industry at the present time, according to the Alexander Hamilton Institute.

"This year the banking situation is sound," it observes. In place of increased credit stringency after stock prices broke, as in 1919-1920, "the end of the first week of the break this fall witnessed a reduction in the rediscount rate at New York."

Iron and Steel Markets

Steel Trade Regaining Confidence

Output Declines Further But Buoyancy of Demand in Certain Lines Allays Fear of Drastic Slump —Scrap Continues to Weaken

THE manner in which business has withstood the shock of the Wall Street panic has done much to restore confidence among buyers and sellers of iron and steel. While the output of furnaces and mills has undergone a further decline, consumption has shown no general curtailment and in a number of leading lines has held its own or has gained.

Entirely apart from the heartening effect of President Hoover's conferences, the news of the week is favorable. The large demand for fabricated structural steel is being maintained, 107,000 tons has been added to rail mill backlogs, farm machinery plants have further expanded their operations, there has been another impressive increase in prospective railroad equipment business and large tin plate contracts have been closed for 1930. The outlook in electrically-welded pipe has been brightened by the placing of an order for a California gas line and the reinstatement of line pipe contracts suspended several weeks ago.

These evidences of sustained activity are not interpreted as indicating an early increase in steel output, but rather as an assurance that drastic general curtailment of consumption is not in prospect. With inventory-taking approaching, business will soon feel the effects of the year-end lull, although releases for January rolling of some products will reach the mills in December.

Steel ingot production of Steel Corporation subsidiaries now ranges from 72 to 74 per cent and it is doubtful whether any producer is operating at more than 75 per cent of capacity. Operations of Valley plants have declined to 50 per cent and the rate in the Pittsburgh district is down to 70 per cent, while Chicago output holds at 75 per cent.

Specifications for steel from the automotive industry have continued to recede, and further curtailment is in prospect. However, it is understood that the Ford company will get under production on its new models as quickly as possible and will shortly release sizable tonnages of sheets and other mill products. Two or three Detroit makers of higher-priced cars are now operating at a good rate on new models, while in the Chicago district an important motor car builder has resumed output at 65 per cent of capacity and a large parts maker is ordering steel.

Scrap markets have given further ground in keeping with the reduced requirements of steel plants. Heavy steel scrap has declined 75c. at Pittsburgh and 25c. at Chicago.

Mills have reaffirmed prices on tin plate, wire products and strip steel for first quarter. Specifications for tin plate are beginning to show improvement and the tonnage released prior to Nov. 15 for January rolling was of encouraging proportions. Blue annealed sheets are now generally quotable at 2.25c., Pittsburgh, for No. 13 gage and 2.10c. for No. 10, or $2 a ton lower than prices recently asked by jobbing mills.

Rail orders for the week include 57,000 tons for the Rock Island, 40,000 tons for the Illinois Central and 10,000 tons for the Boston & Maine. Purchases of rails to date for 1930 laying total 1,500,000 tons, and it is estimated that 750,000 tons still remains to be placed. The Southern Pacific has bought 18,000 tons of track supplies. Locomotives ordered during the week total 64, and inquiries for 250 are pending. The Chesapeake & Ohio and the Pere Marquette are expected to ask for figures shortly on 10,000 cars. The New York Central's program for next year calls for the purchase of 15,000 cars.

Shipbuilding plants, already heavily booked, have much additional work in prospect. The United States Lines have taken bids on two ships of the Leviathan type, requiring 20,000 tons of plates and shapes each. The Export Steamship Corporation plans to build two additional vessels. Indications are that the Post Office Department will soon advertise for bids for mail contracts which will result in the construction of 15 to 20 ships, requiring a total of 150,000 tons of steel.

Fabricated structural steel contracts for October, as reported by the Department of Commerce, totaled 342,650 tons, compared with 319,550 tons in September. Awards for the past week, at 41,000 tons, were fairly large. Fresh inquiries aggregate 60,000 tons, including 40,000 tons for a Cincinnati railroad terminal. The release of both private and public work, as a result of the President's conference, will further stimulate building. Federal, State and municipal construction budgets for 1930, originally estimated at $1,125,000,000, are likely to be doubled, according to Washington advices.

Pig iron melt has fallen off in some lines outside of the automotive industry, but this recession is offset, at least in part, by the increased requirements of foundries serving the railroad car builders and the farm equipment makers. Prices are softer in some districts, but producers of merchant iron evidently plan to avoid accumulating surplus stocks by reducing their output. Three Valley stacks have been blown out or banked in the past 10 days, and a Buffalo furnace may go out this week.

THE IRON AGE composite prices are unchanged, pig iron at $18.38 a gross ton and finished steel at 2.362c. a lb. Pig iron is 16c. a ton lower than a year ago; finished steel, 14c. a ton lower.

A Comparison of Prices

Market Prices at Date, and One Week, One Month and One Year Previous, Advances Over Past Week in Heavy Type, Declines in Italics

	Nov. 19, 1929	Nov. 12, 1929	Oct. 22, 1929	Nov. 20, 1928

On export business there are frequent variations from the above prices. Also, in domestic business, there is at times a range of prices on various products, as shown in our market reports on other pages.

Pittsburgh

Steel Operations Continue to Decline, Though Tonnage Releases in Some Lines are Improved

PITTSBURGH, Nov. 19.—Although one or two Pittsburgh district steel companies report somewhat better specifications, the general situation has changed very little in the last week, and it cannot be denied that business is very dull. Operations continue their downward trend, with companies in the immediate district running this week at approximately 70 per cent of theoretical capacity. Only two or three of the larger interests which make a diversified line of products are at this or a better rate and much of the steel now being made is going into heavier products.

It is significant, however, that present specifications completely justify the comparatively higher rates of the larger companies. In these cases, the increasing tonnage releases of the railroads, car builders and agricultural implement makers have helped to offset the declining requirements of the automobile industry.

The business of companies which depend on the automotive industry for a considerable part of their tonnage is seriously affected. In the Valleys, the average operating rate is not above 50 per cent, and producers elsewhere which make a preponderance of flat-rolled steel products, are no better off. Strip operations have not been so low in at least two years and the same is true with automobile body sheet mills.

Sheet production in general is somewhat higher this week because of a sharp increase in the schedules of the leading producer, but as the announced operating rate of this company also includes the Chicago district, where rather heavy specifications from the railroad car builders and implement makers have been coming in during the last two weeks, it is doubtful whether the output of Pittsburgh and tributary districts will show any increase.

Tin mills are beginning to feel the effects of usual seasonal betterment. Following the reaffirmation of the present price of $5.35 per base box, Pittsburgh, on 1930 business, specifications are beginning to show improvement, and the tonnage released prior to Nov. 15 for January rolling was encouraging.

Strip makers have opened their books for first quarter at unchanged prices. Although buyers are showing little interest in their requirements for that period, the early price announcement seems to have given the market a slightly stronger tone and has helped to offset the pressure of a few comparatively large buyers for lower prices.

In some cases, sheet makers have failed to withstand this pressure and a little business has been taken at concessions. Lower prices on blue annealed sheets and light plates are now more general. However, the majority of companies are maintaining a comparatively firm price stand and the extent to which they have curtailed operations offers support to their growing belief that little business would be driven in by price concessions. The same is true in the case of the heavy hot-rolled products, on which many companies are doing little to stimulate sales, at least in the way of price inducement. The market on

bars, shapes and plates is still reasonably firm at 1.90c., Pittsburgh.

Well sustained shipments are the feature of a very quiet pig iron market. New buying has been negligible in the last few weeks, but consumers continue to take iron on contract at a satisfactory rate. Merchant producers are translating their reluctance to accumulate iron into curtailment of output and another stack in the Valleys has been banked. This is the third to be blown out or banked in a little more than a week.

The decline in scrap prices is unchecked, and No. 1 heavy melting steel is quotable at 50c. to $1 lower than last week, depending upon the opinion of the dealer or consumer. In the absence of any significant mill buying and with the uncertainty of the market, any quotation is nominal and the same gage must be applied to the declines in other grades of scrap.

Semi-Finished Steel.—Little change in the demand for semi-finished steel is noticeable in this market, although the smaller independent steel companies are curtailing their requirements further. This is particularly true of sheet and strip makers, whose operations in many cases have fallen under 50 per cent of capacity in the last few weeks. The market offers little test for prices, but leading sellers are quoting $35, Pittsburgh or Youngstown, for billets, slabs and sheet bars, and $40 for forging billets. The price is subject to little pressure, as most buyers have enough tonnage under contract to last them the remainder of the year. Wire rods are unchanged at $40 a ton, Pittsburgh or Cleveland, and the market is very dull.

Pig Iron.—In the face of little or no buying of pig iron in the Pittsburgh and Valley districts, shipments this month have held up unusually well, and the leading merchant interest has been moving more iron than it has produced. This is not true in the case of all makers, but it is certain that the pig iron melt in this vicinity has not declined very much in the last few weeks. One exception is the mold foundries, which are operating at a very low rate, but steel foundries serving the railroad equipment makers are growing more active, offsetting decreases elsewhere to a certain extent. The lack of buying may be attributed partly to the present uncertainty of business conditions, but many consumers have their needs over the next few weeks covered by contract and can scarcely be expected to commit themselves further. The price situation is rather uncertain and, in the absence of inquiries for more than 100 to 200 tons, there is nothing to test the present quotations of $18.50, Valley, for foundry and basic iron and $19 for malleable and Bessemer. In the immediate Valley district, these prices seem to be stronger than they are in Pittsburgh, where competition with local furnaces has developed concessions in the past. Merchant producers are apparently determined not to stock pig iron at this time, and, following the blowing out of two merchant stacks in the Valleys last week, the Davison Coke & Iron Co. has banked its Sharpsville furnace. This leaves only three strictly merchant stacks operating in the Valleys and one in Pittsburgh. Steel companies in the Pittsburgh district, which sometimes sell iron, are also said to be considering blowing out furnaces.

Prices per gross ton, f.o.b. Valley furnace:

Basic	$18.50
Bessemer	19.00
Gray forge	18.00
No. 2 foundry	18.50
No. 3 foundry	18.00
Malleable	19.00
Low phos., copper free	27.00

Freight rate to Pittsburgh or Cleveland district $1.76.

Prices per gross ton, f.o.b. Pittsburgh district furnace:

Basic	$19.00
No. 2 foundry	19.00
No. 3 foundry	18.50
Malleable	19.50

Freight rates to points in Pittsburgh district range from 63c. to $1.13.

Bars, Shapes and Plates.—Mills are still receiving a fair amount of plate specifications, but not as much can be said for bars and shapes. In the case of bars, mill operations are still being curtailed, while structural shape units are being run at a fairly high level because of the well sustained demand from the large fabricating shops which have heavy backlogs. The bulk of the plate specifications now being released are coming from car builders in this territory, although there is still some demand from barge yards. However, barge requirements will be considerably reduced in a short time unless some orders are booked. A few inquiries are before the trade and more business is under negotiation, but barge lines are slow to take action on additional capacity at this time. Prices are holding at 1.90c., Pittsburgh, but the market can scarcely be called strong at that figure.

Rails and Track Accessories.—Interest in this market is centered at Washington, where the conference of railroad executives, to be followed later in the week by the regular meeting of the American Railway Association in Chicago, is expected to stimulate considerable railroad buying. The New York Central will take bids on Nov. 27 on the track accessories for its recent rail order, but otherwise the market is inactive. The Baltimore & Ohio is not yet inquiring for its rail tonnage, but something is expected from this source in the near future.

Bolts, Nuts and Rivets.—Declining demand from the automobile industry has been offset to some extent by increased business from the railroads, so the bolt and nut industry has been able to maintain a fair operation, that is, approximately 60 per cent of capacity. Jobbers' stocks are not excessive. Prices are holding well.

Wire Products.—Wire makers have opened their books for first quarter, with prices unchanged, and the market is developing a stronger trend at these figures. They are 2.40c. a lb., Pittsburgh, for manufacturers' wire; $2.40 to $2.50 a keg on nails, and 2.55c. to 2.65c. a lb. on annealed fence wire for the jobbing trade. Business is very quiet, but this is seasonal in some lines.

Tubular Goods.—Light demand for pipe and tubular products has not seriously interfered with the operations of mills in this territory, and seamless and lapwelded units are still running at 60 per cent of capacity.

Tin Plate

	Per Base Box
Standard cokes, f.o.b. P'gh district mills	$5.35
Standard cokes, f.o.b. Gary	5.45

Terne Plate

(*F.o.b. Morgantown or Pittsburgh*)
(Per Package, 20 x 28 in.)

8-lb. coating I.C.	$11.20
15-lb. coating I.C.	14.00
20-lb. coating I.C.	15.30
25-lb. coating I.C.	$16.70
30-lb. coating I.C.	17.75
40-lb. coating I.C.	19.85

Alloy Steel Bars

(F.o.b. makers' mill)

Alloy Quality Bar Base, 2.65c. to 2.75c. per Lb.

S.A.E. Series Numbers		Alloy Differential
2000	(½% Nickel)	$0.25
2100	(1½% Nickel)	0.55
2300	(3½% Nickel)	1.50
2500	(5% Nickel)	2.25
3100	Nickel Chromium	0.55
3200	Nickel Chromium	1.35
3300	Nickel Chromium	3.80
3400	Nickel Chromium	3.20
4100	Chromium Molybdenum (0.15 to 0.25 Molybdenum)	0.50
4100	Chromium Molybdenum (0.25 to 0.40 Molybdenum)	0.70
4600	Nickel Molybdenum (0.20 to 0.30 Molybdenum, 1.25 to 1.75 Nickel)	1.05
5100	Chromium Steel (0.60 to 0.90 Chromium)	0.35
5100	Chromium Steel (0.80 to 1.10 Chromium)	0.45
5100	Chromium Spring Steel	0.20
6100	Chromium Vanadium Bars	1.20
6100	Chromium Vanadium Spring Steel	0.95
9250	Silicon Manganese Spring Steel (flats)	0.25
	Rounds and squares	0.50
	Chromium Nickel Vanadium	1.50
	Carbon Vanadium	0.95

Above prices are for hot rolled steel bars, forging quality. The differential for cold-drawn bars is ¾c. a lb. higher, with standard classification for cold-finished alloy steel bars applying. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis.

Billets under 4 x 4 in. carry the steel bar base. Slabs with a sectional area of 16 in. or over carry the billet price. Slabs with sectional area of less than 16 in. or less than 2½ in. thick, regardless of sectional area, take the bar price.

Rails

	Per Gross Ton
Standard, f.o.b. mill	$43.00
Light (from billets), f.o.b. mill	36.00
Light (from rail steel), f.o.b. mill	34.00
Light (from billets), f.o.b. Ch'go mill	36.00

Track Equipment

	Base per 100 Lb.
Spikes, ⅝ in. and larger	$2.80
Spikes, ½ in. and smaller	2.80
Spikes, boat and barge	3.00
Tie plate, steel	2.15
Angle bars	$2.75
Track bolts, to steam railroads	$3.80 to 4.00
Track bolts, to jobbers, all sizes, per 100 count	70 per cent off list

Welded Pipe

Base Discounts, f.o.b. Pittsburgh District and Lorain, Ohio, Mills

7 and 8	56	43½	4 to 6	30	17
9 and 10	54	42½	7 and 8	29	16
11 and 12	53	40½	9 to 12	26	11

Butt Weld, extra strong, plain ends

⅛	41	24½	¼ and ⅜	+13	+48
¼ to ⅝	47	30½	½	23	7
½	53	42½	¾	28	12
¾	58	47½	1 to 2	34	18
1 to 1½	60	49½			
2 to 3	61	50½			

Lap Weld, extra strong, plain ends

2	53	42½	½	29	13
2½ to 4	57	46½	2½ to 4	34	20
4½ to 6	56	45½	4½ to 6	33	19
7 to 8	52	39½	7 and 8	31	17
9 and 10	45	32½	9 to 12	21	8
11 and 12	44	31½			

On carloads the above discounts on steel pipe are increased on black by one point, with supplementary discount of 5%, and on galvanized by 1½ points, with supplementary discount of 5%. On iron pipe, both black and galvanized, the above discounts are increased to jobbers by one point with supplementary discounts of 5 and 2½%.

Note.—Chicago district mills have a base two points less than the above discounts. Chicago delivered base is 2½ points less. Freight is figured from Pittsburgh, Lorain, Ohio, and Chicago district mills, the billing being from the point producing the lowest price to destination.

Boiler Tubes

Base Discounts, f.o.b. Pittsburgh

Steel		*Charcoal Iron*	
2 in. and 2¼ in.	38	1½ in.	1
2½ in.—2¾ in.	46	1¾ in.	8
3 in.	52	2 in.—2¼ in.	13
3¼ in.—3¾ in.	54	2½ in.—2¾ in.	16
4 in.	57	3 in.	17
4½ in. to 6 in.	46	3¼ in. to 3½ in.	18
		4 in.	20
		4½ in.	21

On lots of a carload or more, the above base discounts are subject to a preferential of two fives on steel and of 10 per cent on charcoal iron tubes. Smaller quantities are subject to the following modifications from the base discounts:

Lap Welded Steel—Under 10,000 lb., 6 points under base and one five; 10,000 lb. to carload, 4 points under base and two fives. Charcoal Iron—Under 10,000 lb., 2 points under base; 10,000 lb. to carload, base and one five.

Standard Commercial Seamless Boiler Tubes

Cold Drawn

1 in.	61	3 in.	46
1¼ to 1½ in.	53	3¼ to 3½ in.	48
1¾ in.	37	4 in.	51
2 to 2¼ in.	32	4½, 5 and 6 in.	40
2½ to 2¾ in.	40		

Hot Rolled

2 and 2¼ in.	38	3¼ to 3½ in.	54
2½ and 2¾ in.	46	4 in.	57
3 in.	52	4½, 5 and 6 in.	46

Beyond the above base discounts a preferential discount of 5 per cent is allowed on carload lots. On less than carloads to 10,000 lb., base discounts are reduced 4 points with 5 per cent preferential; on less than 10,000 lb., base discounts are reduced 6 points, with no preferential. No extra for lengths up to and including 24 ft. Sizes smaller than 1 in. and lighter than standard gage take the mechanical tube list and discounts. Intermediate sizes and gages not listed take price of next larger outside diameter and heavier gage.

Seamless Mechanical Tubing

	Per Cent Off List
Carbon, 0.10% to 0.30%, base (carloads)	55
Carbon, 0.30% to 0.40% base	50

Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.

Buttweld operations are not quite so high, but have not slumped off as much as might be expected at this time of the year. Some oil companies have inquiries out for seamless goods, but are slow to take action on these projects. Shipments of mechanical tubing this month are considerably behind those of October, but boiler tubes have held up.

Cold-Finished Steel Bars.—Business is very quiet, with automotive demand practically negligible, and other consuming lines taking material at a moderate rate. Cold-finished steel makers have low inventories and have been able to keep their stocks of steel in line with finishing mill requirements. The price of 2.20c., Pittsburgh, is not subject to question.

Sheets.—Specifications were heavier last week with most of the larger companies and some new business was taken. A large part of this tonnage came from railroad car builders and farm implement makers. Automobile tonnage showed little improvement. Demand for metal furniture sheets is still fairly good and electrical sheets continue active. Operations are rather spotty, particularly in the Valleys, where only about 40 per cent of the available mills were rolling last week. The figure is slightly higher this week, and the country's leading sheet maker, whose operations were well under 70 per cent last week, has scheduled its mills at a considerably better rate this week. In contrast to this, one large Valley interest is practically idle, and the average for the industry is not above 60 per cent. No marked improvement is expected before the first of the year, but many believe that the low point has about been reached. Prices are still very weak. The leading interest has opened its books for the first quarter on tin mill black plate, reaffirming the present quotation of 3c., Pittsburgh, although the market is still quotable at 2.90c. to 3c. Galvanized sheets are now rather generally being sold at 3.40c., Pittsburgh, although some mills continue to quote 3.50c. Black sheets are holding in this territory at 2.75c., but lower quotations have come out in a few cases. Some makers are being forced to recognize shading on blue annealed sheets and light plates, and the jobbing mill product is now quotable at 2.10c. to 2.20c., Pittsburgh, and 2.25c. to 2.35c. for the No. 10 and No. 13 gage respectively. Even the minimums of these ranges are not effective in taking business against competition of the wide strip mills.

Tin Plate.—The American Sheet & Tin Plate Co. has opened its books for 1930, reaffirming the present price on standard coke tin plate of $5.35 a base box, Pittsburgh. Leading independents generally have taken the same action. The last week brought better specifications, as material for January rolling is expected to be released before the 15th of the second month preceding, and one large maker reported the heaviest specifications for any week since July. Operations have not been stepped up very much, although improvement is assured next month.

Strip Steel.—Leading makers of strip steel have opened their books for the first quarter with prices unchanged at 1.90c. and 2c., Pittsburgh, for hot-rolled material and 2.75c., Pittsburgh or Cleveland, on cold-rolled in carload lots or more. For less than carload lots, the price is 2.85c. In a few cases, makers have had an opportunity to quote on first quarter business, but the great majority of users are showing little interest in their requirements for that time. However, the price announcement has given the market a slightly stronger tone. Specifications are very light, but in a few cases new orders are reported as somewhat better this week. Hot-rolling mills capacity, but cold-rolling units are are engaged at about 40 per cent of not even this busy, and the average for the strip industry as a whole is below 40 per cent.

Coal and Coke.—Furnace coke is weaker, but, in view of the fact that demand is not expected to improve until after the first of the year, curtailment in production is likely in an effort to maintain prices at present levels. The $2.65 to $2.75, Connellsville, quotations now in effect, are said to allow a very small margin of profit. Foundry coke demand is also light, and prices are very weak. Even the premium brands are subject to considerable pressure, but most makers continue to quote $3.85, ovens. Demand for coal is only fair, as the weather is not yet cold enough to stimulate sales of the domestic grades, and industrial consumption is declining in this district.

Old Material. — Further weakness has developed in the scrap market, and, although today's quotations must be considered as only nominal, No. 1 heavy melting steel is quotable at 50c. to $1 a ton less than it was last week. A small tonnage was sold to a local steel company last week at $15.50, while a sale of strictly railroad steel was reported at $16.50. In view of this, the market seems quotable between those figures, with an average of $16 and a net decline of 75c. from last week. However, this figure is so indefinite that it is hard to determine whether a dealer would be willing to sell a large tonnage at this figure, while it is certain that no mill is willing to buy. Hold-ups are in effect at a number of principal consuming points and others are definitely limiting shipments. With no prospect of increase in steel plant operations until at least the first of the year, there is nothing to bring out scrap purchases, and consequently little to bolster the market. Hydraulic compressed sheets are nominally quotable on the same basis as the heavy melting grade, and declines are recognized on nearly all the other items. Specialties have held better than other grades because of the comparatively good operating rates of steel foundries, but the blast furnace grades are off this week as a result of curtailed shipment to principal consuming points.

Milled studs	70

Chicago

Western Steel Industry Senses a Return of Confidence—Miscellaneous Orders Gain—Rail Tonnage Heavy

CHICAGO, Nov. 19.—Foremost among developments in the Chicago iron and steel market is a clear indication that confidence is returning to business as a whole. A week ago little could be said of specifications and new purchases outside of the needs of railroads and car builders. In the past week this situation has changed and, without taking into account rail business, releases for finished steel have again reached a volume closely matching current ingot output, which stands at 75 per cent of capacity.

New orders are individually small and the pressure for immediate delivery is insistent, giving indication of the condition of stocks in the hands of users. There is also the fact that many buyers, having been too cautious in recent weeks, now find that their supplies of steel are inadequate for immediate needs.

The impulse to speed production is being felt in several industries. Farm implement manufacturers are entering into a higher rate of production on tractors and are putting new schedules in operation for the manufacture of combines. Automobile frame makers are sending in larger specifications for hot-rolled strips, and automobile and parts manufacturers are finding slightly greater needs for alloy steel bars. The award of a new gas line for a California company and releases against line pipe contracts, which were temporarily suspended several weeks ago, are bringing large buyers of plates into the market, and the effect on plate shipments is already noticeable. Specifications for car material are heavy, and there is a growing impression that car shops are preparing to expand output in anticipation that equipment purchases will be in good volume after the turn of the year.

Several large industrial plants, which closed down soon after the collapse in the stock market, have resumed operations on scales ranging from 40 to 60 per cent of capacity.

Bolts, Nuts and Rivets.—Some improvement is noted in specifications from automobile manufacturers. Shipments to car builders, the railroads and farm implement makers are steady.

Ferroalloys.—Several contracts for ferromanganese for future delivery have been closed at $105 a ton, seaboard. Clauses protecting buyers against declines in prices are being attached. It is reported here that contracts for 50 per cent ferrosilicon will not be offered to consumers until late in December. The spiegeleisen market is quiet except for spot orders of small size, which bring $34 a ton, Hazard, Pa.

Prices delivered Chicago: 80 per cent ferromanganese, $112.56; 50 per cent ferrosilicon, $83.50 to $88.50; spiegeleisen, 19 to 21 per cent, $39.76 to $41.76.

Pig Iron.—Shipments of Northern foundry iron about equal the output of merchant stacks, though there has been some redistribution of tonnage in recent days. Iron not being taken by industries adversely affected by business conditions is readily being absorbed by manufacturing plants which have larger orders on hand. Farm implement manufacturers are drawing more heavily against contracts for pig iron, and railroad equipment makers are taking larger shipments. Several orders from automobile plants that until recently were marked for indefinite suspension have been changed to releases for delivery about Dec. 1. A cargo of pig iron has been unloaded at a Chicago dock and another boat-load is expected in a few days. The Southern iron market is quiet, with quotations ranging from $13 to $14 a ton, Birmingham.

Prices per gross ton at Chicago:

N'th'n No. 2 fdy., sil. 1.75 to 2.25	$20.00
N'th'n No. 1 fdy., sil. 2.25 to 2.75	20.50
Malleable, not over 2.25 sil.	20.00
High phosphorus	20.00
Lake Super. charcoal, sil. 1.50	27.04
So'th'n No. 2 fdy. (all rail)	$19.01 to 19.51
Low phos., sil. 1 to 2, copper free	29.50
Silvery, sil. 8 per cent	$28.79 to 29.79
Bess. ferrosilicon, 14-15 per cent	46.29

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Sheets.—New business continues to taper, and prices are giving ground. Galvanized sheets are now quotable at 3.50c. to 3.60c. a lb., Gary, and black sheets at 2.85c. Output ranges from 60 to 70 per cent of capacity at local hot mills, and schedules are not complete for a week in advance. A part of the slowing down in demand can be attributed to a customary seasonable lull, but it is also partly the result of extreme caution on the part of many consumers. Stocks in the hands of buyers are small, and mills are being pressed for prompt deliveries on numerous small orders.

Base prices per lb., deliv'd from mill in Chicago: No. 24 black sheets, 2.90c.; No. 24 galv., 3.55c. to 3.65c.; No. 10 blue ann'l'd, 2.35c. Deliv'd prices at other Western points are equal to the freight from Gary, plus the mill prices, which are 5c. per 100 lb. lower than Chicago delivered prices.

Cast Iron Pipe.—New business and fresh inquiry are very quiet. The outlook, however, is not wholly discouraging in view of the fact that this is usually a dull season and that much work held in abeyance this year is being considered for 1930. On this score, sellers are hopeful that public work will revive near the end of this year. Genoa, Neb., has ordered 180 tons of 8-in. pipe from the Central Foundry Co. Royal Oak, Mich., is in the market for 100 tons of 8-in. pipe.

Prices per net ton, deliv'd Chicago: Water pipe, 6-in. and over, $43.70 to $45.70; 4-in., $47.70 to $49.70; Class A and gas pipe, $3 extra.

Structural Material.—This market remains quiet in the immediate vicinity of Chicago. In outlying centers, especially at Milwaukee, fabricators are comfortably booked. Many sizable projects are talked of for Chicago, but the trade has little expectation that steel prices will be asked before the turn of the year. The Illinois Steel Co.'s expansion program is making steady progress and plans for several buildings are now in the shop. Several public utility projects, including a large power house addition at Waukegan, Ill., are rapidly taking shape. The aggregate tonnage of steel for highway bridges is large and many Western States are planning sizable bridge programs for the coming year. New railroad work is moderately active, but individual requests for prices are for small tonnages, usually about 25 to 75 tons each.

Mill prices on plain material, per lb.: 2.00c. base, Chicago.

Rails and Track Supplies.—New orders for standard-section rails total more than 100,000 tons, the bulk of which will be rolled by Chicago mills. The Rock Island has placed 39,200 tons with the Illinois Steel Co., 11,000 tons with the Colorado company and 6900 tons with the Inland Steel Co. The Illinois Central has ordered 25,000 tons from the Tennessee company, 10,000 tons from Inland and 5000 tons from Illinois. Of the 23,000 tons placed by the Wabash a week ago, about two-thirds will be rolled at Chicago. Chicago producers estimate that for the country as a whole about 1,500,000 tons of rails has been ordered for 1930 programs. It is estimated that somewhat more than 750,000 tons still remains to be placed. The bulk of the

Cement c't'd nails, base per keg	2.75 to 2.95

tonnage normally expected from Western railroads is already on the books of producers, there being miscellaneous lots aggregating about 80,000 tons which may be placed in the next few weeks. Releases against new contracts are larger, and standard-section rail output is now close to 85 per cent of capacity. Demand for light rails is more active, but the bulk of tonnage is for use in anthracite coal fields and orders are being placed with mills to the east of Chicago. Miscellaneous orders for track supplies total 15,000 tons, a large part of which is to accompany shipments of rails on new contracts. Inquiry for these commodities is turning upward, and requests for prices total 25,000 tons.

Prices f.o.b. mill, per gross ton: Standard section open-hearth and Bess. rails, $43; light rails, rolled from billets, $36. *Per lb.:* Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.07½c. to 2.15c.; angle bars, 2.75c.

Bars.—Demand for soft steel bars has come back sharply after dragging for several weeks. Specifications for the week are fully equal to shipments, which represent about 75 per cent of local bar mill capacity. Farm implement manufacturers account for a large share of the increase as they step up production on tractors and tillage machinery and start output of combines, which are to be delivered in the early part of the new year. The price of soft steel bars remains steady at 2c. a lb., Chicago. There is a steady use of iron bars by car builders and the railroads, and output is at a good fall rate. The price is well established at 2c. a lb., Chicago. Specifications for alloy steel bars are a trifle heavier, and it is interesting that a fair part of this change is due to larger needs by automobile manufacturers. Output in this district is close to 60 per cent of capacity. Shipments of rail steel bars are lighter, as barn equipment manufacturers come to the end of their busy season. Output has been adjusted downward by shortening hours rather than a change from the practice of double turn operation. Demand for fence posts is seasonably dull.

Hot-Rolled Strips.—Quotations in this market are on the basis of 2c. a lb., Chicago, for strips wider than 6 in., and 2.10c. for strips 6 in. and narrower. Demand from most users remains at the low level of recent weeks, but encouragement comes from manufacturers of automobile frames, which now are making schedules for increased deliveries in December.

Cold-Rolled Strips.—Prices in this district remain on the basis of 2.75c. a lb., Cleveland, or 3.05c., delivered Chicago. Interest on the part of consumers is lacking and output is low.

Wire Products.—Changes in this market in the past week have been confined to slight shifts of demand from one commodity to another, with the aggregate tonnage of all wire products remaining practically unchanged. New orders from the jobbers are spotty, some sections of the country showing increases while in other sections needs are lighter. Producers are looking for smaller shipments to distributers as the inventory period approaches. No change is reported in the rate of consumption by the manufacturing trade. Prices for plain wire remain steady at 2.45c. a lb. The slow pace of the building industry is reflected in light demand for nails. Producers are attempting to hold local prices at $2.45 a 100-lb. keg and are meeting with success in the absence of large orders such as would give satisfactory tests of prices. Wire mill output is holding in the range of 55 to 60 per cent of capacity.

Plates. — Increased specifications from car builders reflect, according to sellers of plates, the thought that car building programs will be put through without hesitation and that car builders are anticipating a substantial rate of operations in the first part of the new year. Tank building programs are less active than in October. One new inquiry from the Southwest is for 2500 tons and one order from that territory is for 400 tons. Old projects that at this time are dormant afford the only indication of what oil producers have in mind in the way of new construction if business conditions warrant expansion of facilities. The Milwaukee pipe manufacturer is reported to have taken a contract for a round tonnage of gas pipe for a Pacific Coast company. This tonnage, which is for immediate shipment, and releases against old contracts are serving to stimulate the local plate market. Although production of most sizes of plates is not at the rate of early October, the outlook for this commodity, for oil field and car use especially, is promising. Prices at Chicago are steady at 2c. a lb.

Reinforcing Bars.—New orders for reinforcing bars are scarce, and shop backlogs have been reduced to the point where within a week or 10 days output will of necessity be reduced. The total volume of quotations up for consideration is impressive, but there is no indication that contracts will be placed in satisfactory volume in the near future. An encouraging feature of the market is that recent lettings of small tonnages reflect a strengthening in prices, in some cases as much as $2 a ton. However, tests on attractive business are lacking, and therefore it cannot be assumed the general price level is above that of a week ago. The only award of note this week is for 450 tons for buildings at Illinois State institutions.

Coke.—Contracting for 1930 is under way at $8 a ton, f.o.b. local ovens. Delivered price in Chicago for by-product foundry coke is $8.75 a ton. Shipments are at the rate of local oven capacity.

Old Material.—Prices continue to sag as demand wanes and those who have accumulated scrap try to place it in the market. Close to 10,000 tons of heavy melting steel has been taken by a local mill at $13.50 a gross ton, delivered, a reduction of 25c. a ton since the last large sale to a consumer. Brokers are being offered tonnages freely at 50c. to 75c. a ton below this figure. It is rather commonly believed that most large consumers have comfortable stocks on hand and that restricted shipments closely represent current needs as buyers unload from cars to furnaces. Although some in the trade look to winter weather to check the flow of new scrap and tend to steady the market, there are many who look for light trading throughout the remainder of the year and for lower prices. Some resistance to low prices has developed among producers of scrap who threaten to accumulate this commodity rather than sell it at prevailing quotations. On the other hand, many yard dealers, both local and in the country, are trying to press sales rather than let their yards freeze in for the winter or operate at high cost in cold weather.

Prices deliv'd Chicago district consumers:

Per Gross Ton

Basic Open-Hearth Grades:	
Heavy melting steel	$13.00 to $13.50
Shoveling steel	13.00 to 13.50
Frogs, switches and guards, cut apart, and misc. rails	13.50 to 14.00
Hydraul. compressed sheets	11.25 to 11.75
Drop forge flashings	10.75 to 11.25
No. 1 busheling	11.50 to 12.00
Forg'd cast and r'l'd steel carwheels	17.75 to 18.25
Railroad tires, charg. box size	18.00 to 18.50
Railroad leaf springs cut apart	18.00 to 18.50
Acid Open-Hearth Grades:	
Steel couplers and knuckles	16.50 to 17.00
Coil springs	19.00 to 19.50
Electric Furnace Grades:	
Axle turnings	12.75 to 13.25
Low phos. punchings	15.25 to 15.75
Low phos. plates, 12 in. and under	15.25 to 15.75
Blast Furnace Grades:	
Axle turnings	11.50 to 12.00
Cast iron borings	9.25 to 9.75
Short shoveling turnings	9.50 to 10.00
Machine shop turnings	7.00 to 7.50
Rolling Mill Grades:	
Iron rails	14.50 to 15.00
Rerolling rails	15.50 to 16.00
Cupola Grades:	
Steel rails less than 3 ft.	16.50 to 17.50
Steel rails less than 2 ft.	18.50 to 19.00
Angle bars, steel	16.25 to 16.75
Cast iron carwheels	14.00 to 14.50
Malleable Grades:	
Railroad	16.50 to 17.00
Agricultural	14.50 to 15.00
Miscellaneous:	
*Relaying rails, 56 to 60 lb.	23.00 to 25.00
*Relaying rails, 65 lb. and heav.	26.00 to 31.00

Per Net Ton

Rolling Mill Grades:	
Iron angle and splice bars	15.00 to 15.50
Iron arch bars and transoms	17.50 to 18.00
Iron car axles	25.50 to 26.00
Steel car axles	16.00 to 16.50
No. 1 railroad wrought	12.25 to 12.75
No. 2 railroad wrought	11.50 to 12.00
No. 1 busheling	9.00 to 9.50
No. 2 busheling	7.00 to 7.50
Locomotive tires, smooth	14.50 to 15.00
Pipes and flues	9.50 to 10.00
Cupola Grades:	
No. 1 machinery cast	13.50 to 14.00
No. 1 railroad cast	12.50 to 13.00
No. 1 agricultural cast	12.00 to 12.50
Stove plate	11.75 to 12.25
Grate bars	11.25 to 11.75
Brake shoes	10.25 to 10.75

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

New York

Structural Steel Lettings in District 18,000 Tons—Prices Weaker—Pig Iron Buying Light

NEW YORK, Nov. 19.—Pig iron buying is exceedingly light, amounting to only 3000 tons for the week, but sentiment in the trade has improved. Suspensions of shipments have been negligible and in the past few days pressure for deliveries has increased, suggesting that foundries are getting over the effects of the stock market scare. Melters have very little iron on their yards, but they are not disposed to buy ahead. Business pending before the trade does not exceed 3000 tons, which is largely accounted for by two inquiries. The Worthington Pump & Machinery Corporation is in the market for 365 tons of Bessemer and 650 tons of malleable or No. 1X for its Harrison, N. J., plant for deliveries extending from December into the first quarter, and the New York Air Brake Co. wants 400 tons of malleable and 250 tons of foundry for shipment over a similar period to its Watertown, N. Y., works. Stocks on blast furnace yards are still relatively low, and at least one important merchant interest plans to blow out capacity if melt shows material curtailment. Prices, however, are showing the strain of a quiet market. On Buffalo foundry iron, $17.50, base furnace, is a general quotation and remains to be tested on an attractive tonnage. Eastern Pennsylvania foundry iron is more readily available at $18.50, base furnace, and this price was shaded in one important recent transaction. Prices on Alabama iron are uncertain in view of its inactivity in this market. However, Buffalo furnaces are prepared to meet a renewal of Southern competition, having accumulated stocks of barge-borne iron at New Jersey ports. Barge iron is still moving on the State canal, but the season of navigation will close in a week or two.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil. 1.75 to 2.25	$22.41
*Buf. No. 2, del'd east. N. J.	20.78
East. Pa. No. 2 fdy., sil. 1.75 to 2.25	$19.89 to 21.02
East. Pa. No. 2X fdy., sil. 2.25 to 2.75	20.39 to 21.52

Freight rates: $4.91 from Buffalo, $1.39 to $2.52 from eastern Pennsylvania.

*Prices delivered to New Jersey cities having rate of $3.28 a ton from Buffalo.

Finished Steel.—Although some local steel sales offices find encouragement in the fact that orders in the past week have been slightly better than in the preceding week, other offices have suffered a loss in business. On the whole, the volume is probably no less, but gains in one direction are offset by a slowing up in others. Business in bars, sheets and strip is noticeably light, but in structural shapes and plates it is fairly good, while the past week has brought a fairly substantial tonnage in tin plate on contract, following the reaffirmation of the current price of $5.35 a base box. Price developments otherwise are toward weakness. The structural steel market locally is subject to keener competition, and quotations on plain material are lower. The usual range is 2.04½c. to 2.14½c. a lb., delivered, New York, but the bottom price has been shaded on large jobs. The maximum price, obtainable only on ordinary lots, is usually 2.14½c. While all of the larger producers of soft steel bars are maintaining a quotation of 1.90c., Pittsburgh, some outside competition has developed at prices which figure back to 1.85c., Pittsburgh. Blue annealed sheets have definitely settled to 2.25c., Pittsburgh, for No. 13 gage and to 2.10c. for No. 10 gage. Some jobbing mills are now recognizing these prices on desirable orders, though $1 or $2 higher is frequently quoted on small lots. Railroad equipment and building construction still offer the most encouraging prospects for nearby bookings of tonnage lots. Structural steel lettings in the New York district during the week, at 18,000 tons, compared favorably with those of any recent week. The largest award, 12,300 tons, for a subway section in Brooklyn, went to the American Bridge Co. Although a fair amount of structural work is pending, some projects now on the architects' boards are not being put out for bids until the industrial situation and the mortgage money market have become clarified. The railroad equipment market is stimulated by the expectation that the Chesapeake & Ohio and the Pere Marquette railroads will shortly come into the market for 10,000 cars and the probability that the New York Central will announce a program calling for the purchase of about 15,000 cars for 1930 delivery. Following the conference of railroad executives with President Hoover on Tuesday and the meeting of the American Railway Association in Chicago on Friday, it is expected that the equipment purchasing programs of the railroads will be accelerated. In addition to about 15,000 cars now pending, it is expected that inquiries will soon come into the market for 40,000 to 50,000.

Mill prices per lb., deliv'd New York: Soft steel bars, 2.24c.; plates, 2.17½c. to 2.22½c.; structural shapes, 2.04½c. to 2.14½c.; bar iron, 2.14c.

Cast Iron Pipe.—The usual buying at this season of gas pipe for spring delivery has not yet developed, and municipal business continues light. The Federal Water Service Corporation, New York, is in the market for about 300 tons of water pipe for Girard, Ohio, and 500 tons for Salem, Ore. Prices continue irregular, ranging from $31 to $34 a ton, f.o.b. foundry. Northern producers are still fairly well engaged on large sizes of pipe, but Birmingham foundries are at low operating rates and are in need of business, as stocks on their yards are increasing.

Prices per net ton deliv'd New York: Water pipe, 6-in. and larger, $34.60 to $36.60; 4-in. and 5-in., $37.60 to $39.60; 3-in., $44.60 to $46.60. Class A and gas pipe $3 extra.

Warehouse Business.—Cold-finished shafting and screw stock has been reduced by jobbers $2 a ton to 3.50c. a lb. for rounds and hexagons and 4c. a

lb. for flats and squares. Effective Nov. 15, black sheets have been reduced $2 a ton to 3.90c. a lb., base, and galvanized sheets $5 a ton to 4.50c. a lb., base. Orders continue in good volume, but are individually small, so that the month is not expected to prove so satisfactory as October.

Coke.—Producers of beehive foundry coke have opened their books for first quarter and first half contracts. The price is unchanged at $4.85 a net ton, ovens, for special brands, or $8.56, delivered to northern New Jersay, Jersey City and Newark, and $9.44 to New York and Brooklyn. Standard furnace coke is quiet, with the usual quotation $2.75 a net ton, Connellsville, but distress carloads are occasionally going at $2.65 to $2.70 a ton. By-product foundry coke is quoted at $9 to $9.40 a net ton, Newark or Jersey City, and $10.06, New York or Brooklyn.

Reinforcing Bars.—The volume of small-lot buying has diminished somewhat in the past week, largely on account of seasonal conditions. Although sales are falling considerably behind those of October, they are about on a par with those in November of last year. Prices are fairly steady at 2.05c., New York.

Old Material.—Consumer buying of scrap continues limited. Brokers with contracts report a good supply of old material at present buying prices. No. 1 heavy melting steel is quoted at $14.50 a ton, delivered eastern Pennsylvania. The buying price of No. 2 heavy melting steel, delivered to Phoenixville or Harrisburg, Pa., has been reduced to $12.50 a ton, a decline of 50c. The consumer of No. 2 automobile steel at Pencoyd, Pa., has placed some small tonnages with brokers at $13.75 a ton, delivered. Steel car axles have declined $1 a ton on the basis of a recent sale at $20 a ton, delivered, on a freight rate of $3.78 a ton, the broker offering $15.75 a ton, delivered, to fill the order.

Dealers' buying prices per gross ton, f.o.b. New York:

No. 1 heavy melting steel	$11.00 to $11.85
Heavy melting steel (yard)	8.00 to 9.00
No. 1 hvy. breakable cast.	10.25 to 11.00
Stove plate (steel works).	8.00

Malleable cast (railroad).	13.50 to 14.00
Cast borings (chemical)..	9.00 to 9.50

Prices per gross ton, deliv'd local foundries:

No. 1 machry. cast.....	$15.50 to $16.00
No. 1 hvy. cast (columns, bldg. materials, etc.), cupola size	13.50 to 14.00
No. 2 cast (radiators, cast boilers, etc.)	13.00 to 13.50

Cleveland

Automobile Industry Curtails Further But Ford Is Expected to Release Orders Soon for New Program

CLEVELAND, Nov. 19.—A further curtailment of the automotive industry is in prospect as two or three motor car manufacturers in Detroit are scheduled to close down Nov. 23 for inventory. The Ford Motor Car Co. has sharply curtailed operations preparatory to starting on its new models, and has cut off shipments from some of its parts makers and automobile body plants. However, it is understood that the Ford company plans to get under production on its new cars as quickly as possible and will shortly release some good-sized orders for sheets and other mill products. Two or three of the Detroit automobile plants making higher-priced cars are under good production on new models. However, the industry as a whole is not expected to show much of a pick-up until after the automobile shows.

Building work is light, but lower interest rates are expected to stimulate activity. The first inquiry for steel for the Cincinnati Union Terminals project has come into the market. It is stated that this development will require 40,000 tons of steel.

The volume of business in finished steel continues very light. There has been a further reduction in operations by some of the finishing mills that are particularly affected by the lack of a demand by the automotive industry and a rather sharp curtailment in ingot production in this territory. While a few sheet mills increased operations this week, the aggregate output by sheet and strip mills has been further reduced. Some new business in steel bars, plates and structural shapes was placed by consumers whose stocks have become depleted. However, buying is of a cautious character for early shipment.

While business in most lines outside the automotive industry has slowed down, it is still fair, and orders entered by some of the mills making the heavier rolled products have been as good so far this month as during the corresponding period of October. Agricultural implement manufacturers continue to operate well.

Present prices on black and automobile body sheets and hot and cold-rolled strip steel have been reaffirmed by some of the mills for the first quarter.

Scrap prices are weak and shipments have been quite generally suspended by Cleveland and Valley district mills. The last cargo of boat scrap to be sent from Detroit to Cleveland this season was shipped during the week.

Pig Iron.—A few small-lot sales of foundry iron for the first quarter totaling 1000 tons were sold by one Lake furnace interest during the week at the current prices. The market continues rather quiet, buying for the most part being of a hand-to-mouth character. Sales by Cleveland interests during the week aggregated 10,500 tons. These included a cargo of boat iron for shipment to Chicago before the close of the season of navigation. Shipments during the first half of November were about the same as in the corresponding period of October, but a falling off is looked for during the remainder of the month. While a few foundries in the automotive industry are taking a little more iron than last month, the total shipments to that industry show no gain. There has been some further slowing down of operations by jobbing foundries in the northern Ohio territory. Prices are unchanged at $18.50, Cleveland, for out-of-town shipment and $19, furnace, for local delivery. New weakness has developed in Southern iron, which is now being offered at $13.50 to $14, Birmingham, and these prices are being named for first quarter delivery.

Prices per gross ton at Cleveland:

N'th'n fdy., sil. 1.75 to 2.25	$19.50
S'th'n fdy., sil. 1.75 to 2.25	$19.50 to 20.50
Malleable	19.50
Ohio silvery, 8 per cent...	28.00
Basic Valley furnace.....	18.50
Stand. low phos., Valley..	26.50 to 27.00

Prices except on basic and low phosphorus are delivered Cleveland. Freight rates: 50c. from local furnaces; $3 from Jackson, Ohio; $6 from Birmingham.

Semi-Finished Steel.—A local mill was given a 1000-ton release of slabs during the week, but aside from this spurt specifications continue light. The leading local producer is still operating eight of its 14 open-hearth furnaces, but is running from hand to mouth. There is no new inquiry. Shipments are being made against contracts at the quoted prices.

Strip Steel.—A Cleveland mill has opened its books for the first quarter at the current prices of 1.90c., Pittsburgh, for hot-rolled wide strip and 2c. for narrow, and 2.75c., Cleveland and Pittsburgh, for cold-rolled strip and 4.25c. for fender stock. A few inquiries have come out for that delivery from consumers in the automotive field that evidently are planning to line up their requirements with a

*Net base, including boxing and cutting to length.

view of getting under production on new models in January. Current orders continue very light, and the tendency in mill operations was downward during the week. Although all mills are in need of business, there seems to be little disposition to shade regular quotations.

Bars, Plates and Shapes.—Structural shapes are in fair demand, largely from small fabricating shops that are well filled with work. The largest local award during the week was 800 tons for a building for the Grasselli Chemical Co. The assembly plant for the Ford Motor Co. at Edgewater, N. J., requiring 6500 tons, was placed in Detroit. Plates are not moving so well as recently, but small-lot inquiry has improved. Bars are dull and local mills need orders. Weakness is still in evidence in the local bar market, with quotations of 1.85c., Cleveland, or lower. However, outside mills generally are holding to 1.90c., Cleveland. Structural shapes and plates are firm at 1.90c., Pittsburgh, with small lots bringing 1.95c. The higher price is being well maintained on boiler plates.

Sheets.—Present regular quotations of 2.75c. on black and 4c. on auto body sheets have been reaffirmed for the first quarter by two or three mills. While conditions do not indicate any urgency in placing contracts, some consumers in the automotive field have shown interest in what the prices will be for the quarter and some business in auto body sheets for January shipment will probably be placed within the next two weeks. Current demand continues very dull. While a few fair-sized releases came from the automotive industry during the week, enabling a few mills to increase operations, aggregate orders from this industry are still very light. Demand from other consumers has slowed down and is confined to small lots. The market is weak. A local inquiry for 1500 tons of black sheets in various finishes and metal furniture sheets for electric refrigerators brought out rather sharp concessions and only 280 tons was placed. On blue annealed sheets, prices of 2.10c., Pittsburgh, for No. 10 and 2.25c. for No. 13 have become rather common. On black sheets, 2.75c. seems to be holding on most small lots. Galvanized sheets range from 3.40c. to 3.50c., the lower price having become more general. Metal furniture sheets appear to have settled to 4c., and it is reported that this price has been shaded.

Wire Products.—Nails are moving slightly better than recently. The price situation is regarded as somewhat improved, the $2.40 per keg price to jobbers now being maintained in this territory. Bolt wire is in light demand because of the inactivity of the automotive industry. Wire prices are well maintained.

Warehouse Business. — Jobbers' sales have shown a rather steady decline this month in practically all products, business having been affected both by the slowing down of manufacturing industries and by the ability of buyers to secure prompt mill shipments. Prices are firm.

Coke.—Domestic coke is moving only moderately well, as weather conditions have not stimulated consumer demand. The market lacks firmness and one Valley producer which recently advanced to $5.25 for the egg size has reduced its price to $5. Connellsville heating coke ranges from $2.75 to $3. Foundry coke is quiet and prices are unchanged. Ohio by-product foundry coke is quoted at $8.25, ovens.

Old Material.—In the absence of any demand to support the market, prices here declined 50c. a ton or more on heavy melting steel, compressed sheet steel, machine shop turnings and blast furnace grades. The market has a weak tone and there is considerable uncertainty as to what prices would be quoted should an inquiry come out of sufficient size to furnish a test. Shipments to local mills are still suspended, with the exception of a small quantity that is being taken by one consumer, and shipments have been held up in the Valley district. Most consumers have large stocks.

Prices per gross ton delivered consumers' yards:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$14.00 to $14.50
No. 2 heavy melting steel	13.50 to 13.75
Compressed sheet steel	14.00 to 14.50
Light bundled sheet stampings	12.00 to 12.50
Drop forge flashings	12.00 to 12.50
Machine shop turnings	9.00 to 9.75
Short shoveling turnings	11.50 to 12.00
No. 1 railroad wrought	13.50 to 14.00
No. 2 railroad wrought	16.00 to 16.50
No. 1 busheling	13.25 to 13.75
Pipes and flues	9.00 to 9.50
Steel axle turnings	12.50 to 13.00
Acid Open-Hearth Grades:	
Low phos., forging crops	17.75 to 18.00
Low phos., billet, bloom and slab crops	18.50 to 18.75
Low phos., sheet bar crops	18.00 to 18.50
Low phos., plate scrap	18.00 to 18.50
Blast Furnace Grades:	
Cast iron borings	10.00 to 10.50
Mixed borings and short turnings	10.00 to 10.50
No. 2 busheling	10.00 to 10.50
Cupola Grades:	
No. 1 cast	17.00 to 17.50
Railroad grate bars	11.00 to 12.00
Stove plate	12.00 to 12.50
Rails under 3 ft.	18.50 to 19.50
Miscellaneous:

Philadelphia

Steel Orders Small and Prices Lack Firmness—Boston & Maine Places Rails—Scrap Weak

PHILADELPHIA, Nov. 19.—The cautious attitude of buyers following the recent decline in the stock market is apparently relaxing and steel mills are beginning to receive some inquiries for early requirements. Actual business, however, is confined to small orders, fairly well distributed in the various consuming fields. Steel prices still lack firmness, and sellers are inclined to grant concessions on desirable tonnages of plates, shapes or sheets.

Shipyards look forward to continued active operation, with a number of ocean ships in prospect from the award of Government mail-carrying contracts.

The Boston & Maine Railroad has placed 10,000 tons of 100 and 130-lb. rails for next year's requirements with the Bethlehem Steel Co.

Pig Iron.—Current buying is almost entirely of carload lots of foundry iron, on which the current price range of $20.50 to $21 a ton, furnace, is fairly well maintained. Railroads are prominent among the consumers at present inquiring for small lots of iron. The Baltimore & Ohio is in the market for 300 tons of foundry grade and a carload of charcoal iron, the Norfolk & Western for a carload of low phosphorus, the Southern Railway and the Delaware, Lackawanna & Western for a carload each of foundry iron. Foundry melt in this district is small, especially among cast iron pipe foundries, but stocks of iron on consumers' yards are not large. Basic iron is inactive, with a Claymont, Del., consumer still testing the market before issuing a formal inquiry. Demand for low phosphorus is limited to occasional carload lots.

Prices per gross ton at Philadelphia:

East. Pa. No. 2, 1.75 to 2.25 sil.	$21.26 to $21.76
East. Pa. No. 2X, 2.25 to 2.75 sil.	21.76 to 22.26
East. Pa. No. 1X	22.26 to 22.76
Basic (del'd east. Pa.)	19.75 to 20.25
Gray forge	20.00 to 20.50
Malleable	21.25 to 21.75
Stand. low phos. (f.o.b. N. Y. State furnace)	22.00 to 23.00
Cop. br'g low phos. (f.o.b. furnace)	23.50 to 24.00
Va. No. 2 plain, 1.75 to 2.25 sil.	22.29
Va. No. 2X, 2.25 to 2.75 sil.	22.79

Prices, except as specified otherwise, are deliv'd Philadelphia. Freight rates: 76c. to $1.64 from eastern Pennsylvania furnaces; $4.54 from Virginia furnaces.

Reinforcing Bars.—Projects requiring reinforced concrete have begun to decrease, but there is still some pending business in this district, calling for small lots of bars, including a vehicular underpass in Camden, N. J., for the Delaware River bridge, and a bulkhead on the Schuylkill River being built jointly by the Pennsylvania Railroad and the city of Philadelphia. Prices are unchanged, with billet steel bars quoted at 1.95c. to 2c. a lb., Pittsburgh, or 2.27c. to 2.32c., delivered Philadelphia, and the extra for cutting to length usually waived. Rail steel bars are quoted at 1.85c. to 1.95c., Franklin, Pa., and Tonawanda, N. Y., or 2.17c. to 2.27c., delivered Philadelphia, with no extra for cutting to length.

Shapes.—Fabricating shops are well occupied, but are bidding on a smaller volume of new business. Recent bids on fabricated and erected material have been keenly competitive, and the smaller shops say that the present level leaves them little or no profit. Shape mills continue to maintain a fair rate of operation, but prices are lacking in firmness at 1.90c. to 1.95c. a lb., f.o.b. nearest mill to consumer, or 1.96c. to 2.01c., delivered Philadelphia.

Plates.—Shipyards, boiler shops, car and tank builders have provided a substantial part of the tonnage on mill books and, with a number of shipbuilding contracts still to be placed, continued buying is expected from this source. Bids on two ships of the Leviathan type for the United States Lines have been postponed from Nov. 15. A total of about 20,000 tons of plates and shapes will be required by the shipbuilder receiving this contract. The Export Steamship Co., which recently awarded four ships, is contemplating the construction of two more. Prices of plates range from 2c. to 2.05c., Coatesville, Pa., or 2.10c. to 2.15c., delivered Philadelphia. The minimum quotation is applied by most sellers to the larger orders and, as a considerable part of present buying is limited to small lots and miscellaneous specifications, 2.05c., Coatesville, is quoted.

Sheets.—A local automobile body builder has closed for a fair tonnage of high finished and blue annealed sheets, and a radio manufacturer has bought small lots of sheets in excess of estimated requirements to manufacture additional radio sets. On the basis of recent sales of blue annealed sheets, 2.35c., Pittsburgh, or 2.67c., delivered Philadelphia, for No. 13 gage applies only on small, miscellaneous specifications. Preferred buyers, such as automobile manufacturers, are usually quoted $2 to $4 a ton lower. No. 10 gage blue annealed plates are quoted at 2.20c., Pittsburgh, or 2.52c., delivered Philadelphia, with reductions of $2 a ton and more to preferred buyers. Black sheets are quoted at 2.75c. a lb., Pittsburgh, or 3.07c., delivered Philadelphia, but certain preferred buyers claim to have bought at a concession from this price. Galvanized sheets continue at 3.40c., Pittsburgh, or 3.72c., delivered Philadelphia.

Imports.—In the week ended Nov. 16, 10,674 tons of chrome ore arrived at this port, of which 5000 tons was from Portuguese Africa, 4824 tons from Cuba and 850 tons from Greece. Steel imports consisted of 99 tons of steel bands from France and 10 tons from Belgium, 81 tons of steel bars from Belgium, 29 tons of hoop steel from the United Kingdom, 311 tons of structural shapes from Belgium and 38 tons from Germany, 7 tons of steel scrap from the United Kingdom and 4 tons from Germany.

Old Material.—Consumer buying is limited, and the tendency of prices on all grades is downward. Brokers report no difficulty in securing sufficient material to fill current contracts and are unable to interest consumers in further purchases, as many are maintaining a low inventory of materials on their yards.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel.	$15.00 to	$15.50
Scrap T rails	14.50 to	15.00
No. 2 heavy melting steel.	12.50 to	13.75
No. 1 railroad wrought	16.00 to	16.50
Bundled sheets (for steel works)		11.50
Hydraulic compressed, new	14.50 to	15.00
Hydraulic compressed, old.	12.00 to	12.50
Machine shop turnings (for steel works)		11.50
Heavy axle turnings (or equiv.)	14.00 to	14.50
Cast borings (for steel works and roll. mill)	11.00 to	11.50
Heavy breakable cast (for steel works)		14.50
Railroad grate bars	12.00 to	12.50
Stove plate (for steel works)		12.00
No. 1 low phos., hvy., 0.04% and under	21.00 to	22.00
Couplers and knuckles	19.50 to	20.50
Rolled steel wheels	19.50 to	20.50
No. 1 blast f'nace scrap	10.50 to	11.00
Wrot. iron and soft steel pipes and tubes (new specific.)		14.00
Shafting	19.00 to	19.50
Steel axles	21.00 to	22.00
No. 1 forge fire	13.50 to	14.00
Cast iron carwheels	15.50 to	16.00
No. 1 cast	16.00 to	16.50
Cast borings (for chem. plant)		14.50
Steel rails for rolling	16.50 to	17.00

Further Reduction in Wholesale Prices

October wholesale prices are reported by the United States Bureau of Labor Statistics at 96.3 compared with 97.5 in September, and with 97.8 a year ago. There has been a steady and accelerating decline for several months. Sharpest among the declines in October compared with September were those for farm products and foods.

Metals and metal products dropped from 104.1 to 103.6 between September and October, but both figures are well above the 101 of October, 1928. The reduction was participated in by the iron and steel component, nonferrous metals, agricultural implements and automobiles, but the item "other metal products" showed a fractional rise. Only in agricultural implements were the drops more than fractional. Among building materials, however, the item of structural steel dropped from 99.6 in September to 97 in October, both being compared with 94.5 last year.

J. W. Brainard Steel Co. Plans $300,000 Expansion

E. Theodore Sproull, president, J. W. Brainard Steel Co., Warren, Ohio, manufacturer of cold-rolled strip steel, galvanized strips and hoops, announces a program of expansion involving expenditure of $300,000. Two new buildings are to be added, on which work is to be started at once, while a new office building is to be erected in the spring. On May 23, 1929, Mr. Sproull and associates took over the Brainard company. He was at one time general sales manager of the Trumbull Steel Co., and later was vice-president of the National Association of Flat-Rolled Steel Manufacturers.

Factory Wages Highest Ever Recorded

Average weekly earnings in representative New York State factories in September are reported by the State Industrial Commissioner at $30.47, including all employees in both office and shop. This is the highest monthly figure ever recorded, replacing the previous record of $30.35 made last month.

The new figure compares with $30.09 last August and with $29.72 in September, 1928. Until last December no month had ever shown as high as $30.

Motor Car Output Still Declining

Automobile manufacturers will probably continue their curtailing of production for the remainder of the year and some of them now look for the resumption of activity along about the end of February, says *Automotive Industries*.

The level of operations thus far in November appears to be well under the October level. It is extremely difficult to make any estimates of November production at this time, but any guess exceeding 200,000 for the total of the industry might well be considered beyond conservatism. In November of last year factories of the United States and Canada turned out about 268,909.

Stock Sizes of Sheet Steel Have Been Reduced

The variety of stock sizes of sheet steel has been reduced from 1819 to 261 as a result of the simplified practice recommendation of the Division of Simplified Practice, Department of Commerce, Washington. The committee in charge of these practices has reaffirmed without change its recommendations for the coming year. Simplified practices in eaves trough and conductor pipe and in metallic cartridges also will be governed by the same recommendations which have governed during the past year.

Pacific Coast

Structural Steel Awards Largest in More Than Two Months—Demand for Other Products Fair

SAN FRANCISCO, Nov. 16.—(*By Air Mail.*)—Pacific Coast interest in iron and steel products continues and, while there has been some letup in demand, indications point to a good volume of business during the remainder of the year. Cast iron pipe and reinforcing steel bar bookings fell off this week, but structural steel awards were the largest in more than two months. Important lettings called for 2400 tons for the Eleventh Street viaduct, Tacoma, placed with Poole & McGonigle, and 738 tons for the Shasta River bridge in California, booked by the Minneapolis Moline Power Implement Co.

Pig Iron.—Sales and inquiries for foundry pig iron involve unimportant lots. Consumers appear little inclined to anticipate their requirements. Prices are unchanged.

Prices per gross ton at San Francisco:

*Utah basic	$25.00 to $26.00
*Utah fdy., sil. 2.75 to 3.25	25.00 to 26.00
**Indian fdy., sil. 2.75 to 3.25	25.00 to 26.00

*Delivered San Francisco.
**Duty paid, f.o.b. cars San Francisco.

Bars. — Bookings of reinforcing steel bars were the smallest in more than five weeks. Among the more important lettings were 155 tons and 100 tons respectively for a store in Seattle and a penstock at Tacoma, placed with the Northwest Steel Rolling Mills, and 100 tons for an apartment in San Francisco, taken by W. C. Hauck & Co. A fair volume of business is pending and includes 800 tons for the Eleventh Street viaduct, Seattle, and 400 tons for a veterans' home in California. Los Angeles prices on out-of-stock material remain at 2.40c., base, on carload lots and at 2.70c. in smaller quantities. Prices in the bay district are $2 a ton lower.

Plates.—Plate prices remain weak and while 2.35c., c.i.f., is the usual quotation on small lots, as low as 2.15c. has recently been quoted on fairly large lots. The only award of importance went to the Steel Tank & Pipe Co. and involved 1400 tons for a 36 to 48-in. welded steel pipe line at Everett, Wash. Awards will most likely be made next week on 100 tons for a pipe line in Oakland and on 370 tons for one in Seattle.

Warehouse Prices, f.o.b. San Francisco

	Base per Lb.
Plates and struc. shapes	3.30c.
Soft steel bars	3.30c.
Small angles, ⅞-in. and over	3.15c.
Small angles, under ⅞-in.	3.55c.
Small channels and tees, ¾-in. to 2¾-in.	3.75c.
Spring steel, ¼-in. and thicker	5.00c.
Black sheets (No. 24)	4.90c.
Blue ann'l'd sheets (No. 10)	3.80c.
Galv. sheets (No. 24)	5.30c.
Struct. rivets, ½-in. and larger	5.65c.
Com. wire nails, base per keg	$3.40
Cement c't'd nails, 100 lb. keg	3.40

Shapes. — Demand for structural steel in the Pacific Northwest has been exceptionally good during the past few weeks. Activity in the San Francisco district has fallen off somewhat, but bookings in the Los Angeles territory continue to involve some fair-sized lots. The McClintic-Marshall Co. took 100 tons and 150 tons for two apartments in San Francisco and 185 tons for an office building at Bakersfield, Cal. The Pacific Coast Engineering Co. secured 300 tons for a factory in San Francisco for the Link-Belt Co., and the Consolidated Steel Corporation booked 175 tons for a warehouse in Los Angeles for the Crane Co. The Wallace Bridge & Structural Steel Co. was awarded 625 tons for the Bremerton bridge in Washington and 120 tons for a bridge at Woodland, Wash. New inquiries were confined to small lots. Plain material is firm at 2.35c., c.i.f.

Cast Iron Pipe.—Demand for cast iron pipe remains quiet, and no lots of more than 100 tons were noted. Bids will be opened Dec. 2 on 293 tons of 6 to 10-in. Class B pipe for the improvement of La Mesa Colony, San Diego. C. G. Claussen & Co. were low bidders on 147 tons of Class B pipe for the East Bay Municipal Utility District, Oakland. Compton, Cal., has opened bids on 118 tons of 4 to 10-in. Class B pipe for Olive Street.

Steel Pipe.—With the exception of the 100,000-ton inquiry of the Standard Oil Co., San Francisco, for gas pipe, inquiries are for unimportant lots. Standard steel pipe is in fair demand and stocks in distributers' warehouses are well rounded out.

Track Material.—No action has yet been taken by the Southern Pacific Co. on its inquiry for 120,000 tons of 90 to 130-lb. T-rails. This company has placed with unnamed interests 14,000 tons of tie plates, 4000 tons of track spikes and 390 tons of track bolts.

St. Louis

Pig Iron Sales Drop to 2000 Tons—Large Scrap Consumers Hold Back Shipments

ST. LOUIS, Nov. 19.—Sales of pig iron fell off during the last week to about 2000 tons. The St. Louis Gas & Coke Corporation sold 1650 tons, including 500 tons of foundry grades to an implement manufacturer for shipmment this month and next; 250 tons to an Illinois melter for the same delivery, and five 100-ton lots for prompt shipment, all foundry iron, and 300 tons of malleable to a specialty maker for shipment before Dec. 31. A leading Southern maker sold 300 tons for shipment the remainder of the year. Southern makers have not yet opened their books for 1930 deliveries. Stove and implement interests continue to enjoy a heavy melt, but foundries catering to the automobile trade have slowed down somewhat. Pig iron prices continue firm.

Prices per gross ton at St. Louis:

No. 2 fdy., sil. 1.75 to 2.25, f.o.b. Granite City, Ill.	$19.50 to $20.00
Malleable, f.o.b. Granite City	20.00
N'th'n No. 2 fdy., deliv'd St. Louis	22.16
Southern No. 2 fdy., deliv'd	18.42 to 18.92
Northern malleable, deliv'd	22.16
Northern basic, deliv'd	22.16

Freight rates: 75c. (average) Granite City to St. Louis; $2.16 from Chicago; $4.42 from Birmingham.

Coke.—Domestic coke continues in good demand, and piles at by-product ovens have been reduced materially. Smelters are increasing their orders for both breeze and large sizes. Demand for foundry coke has declined.

Finished Steel.—The demand for plates, shapes and bars is said to be fair. Schedules against contracts are being well maintained, although new business is light. The structural trade continues dull, with no local projects of sizable tonnage in sight.

Old Material.—Instructions to withhold shipments against contracts have been issued to dealers of old material by three of the largest consumers in the district, further depressing an already weak market. Lack of orders is the reason given by the mills for their action. No. 2 heavy melting or shoveling steel, miscellaneous standard-section rails, rails for rolling and stove plate are 25c. off, while No. 1 locomotive tires, railroad springs, steel car axles, railroad malleable are down 50c. Railroad lists: Louisville & Nashville, 7500 tons; Chesapeake & Ohio, 5240 tons; Chicago, Burlington & Quincy, 4370 tons; Missouri-Kansas-Texas,

Stove plate	11.75 to 12.25
Agricult. malleable	14.00 to 14.50
Relay. rails 60 lb. and under	20.50 to 23.50
Relay. rails 70 lb. and over	26.50 to 29.00

Canada

Curtailment in Automobile and Implement Lines

TORONTO, ONT., Nov. 19.—A slackening in business is apparent in two or three groups allied with the iron and steel industry in this country. The automotive industry appears to have been hit hardest as a result of the recent crash in the stock markets. The agricultural implement industry has also received a setback. This, however, is principally due to the reduced Canadian crop yield and the low price prevailing for wheat. It is understood that implement plants throughout Canada are now running from 30 to 50 per cent of capacity, compared with near-capacity operations a year ago.

The curtailed activities of these two industries alone have had a telling effect on the Canadian iron and steel industry as a whole. In most instances, however, steel plants are still running at capacity and have sufficient backlogs to carry them along for some time. Railroad orders have had a stimulating effect on the industry this year, with the result that plants have been able to maintain almost capacity operations, while at the same time balance sheets show much more substantial earnings than in other postwar years.

While business is fairly good at present, leading iron and steel interests of this country are unable, or reluctant, to make any statement with regard to 1930.

Pig Iron.—From hand-to-mouth buyers slight improvement in demand has developed, but in all instances tonnages are small, ranging from one to two cars to an occasional order of 200 tons. Shipments against contracts are going forward on schedule. Prices are unchanged.

Prices per gross ton:

Delivered Toronto

No. 1 fdy., sil. 2.25 to 2.75	$23.60
No. 2 fdy., sil. 1.75 to 2.25	23.10
Malleable	23.60

Delivered Montreal

No. 1 fdy., sil. 2.25 to 2.75	$25.00
No. 2 fdy., sil. 1.75 to 2.25	24.50
Malleable	25.00
Basic	23.50

Imported Iron, Montreal Warehouse

Summerlee	$33.50
Carron	33.00

Structural Steel.—Recent orders were chiefly in lots under 500 tons, but inquiry includes some large tonnages. Fabricating plants are running at full time, with backlogs sufficient to keep them at the present rate well into 1930.

Old Material.—New business was in better volume during the past week or 10 days. A few future delivery contracts for machinery cast had a stimulating effect on the market. Spot buying is the strong feature at the moment, however, and it is from the smaller consumers that the bulk of new business is coming. Steel scrap is moving slowly in both Toronto and Montreal markets, but a better demand has developed in the iron grades. No change has been made in buying prices.

Dealers' buying prices:

	Per Gross Ton	
	Toronto	Montreal
Heavy melting steel	$10.00	$8.50
Rails, scrap	11.00	9.00

Cincinnati

Slackening in Demand for Pig Iron, Coke, Scrap and Finished Steel—Old Material Prices Decline

CINCINNATI, Nov. 19.—District buyers of pig iron are displaying extreme caution toward entering the market and are marking time to watch the trend in their own businesses. Sales in this district declined sharply last week, with district furnace representatives reporting approximately 2300 tons as the week's total. All of this was in small quantities, the largest orders having been for two cars. Not only is the current demand easing, but specifications against contracts are showing signs of slackening. In fact, several furnace representatives indicate that during the last week several consumers had requested delay on their usual shipments. While the cut in the automotive demand is most noticeable, specifications from other foundries also are being reduced. The quietness of this market is further reflected by the total absence of any sizable inquiry.

Prices per gross ton, deliv'd Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25	$19.89 to $20.39
Ala. fdy., sil. 1.75 to 2.25	17.69 to 18.19
Ala. fdy., sil. 2.25 to 2.75	18.19 to 18.69
Tenn. fdy., sil. 1.75 to 2.25	17.69 to 18.19
S'th'n Ohio silvery, 8 per cent	26.89

Freight rates, $1.89 from Ironton and Jackson, Ohio; $3.69 from Birmingham.

Finished Steel.—The local steel market is quiet and dull. Operating schedules of district sheet mills, which had been advanced about two weeks ago in anticipation of an improved automotive demand, have again been curtailed. Buyers are cautious. The one bright spot in the sheet market is the continued good demand for galvanized sheets for roofing purposes. One interest here indicates that this grade is contributing a large portion of the current bookings. Fabricated structural steel continues dull, and district fabricators are in need of business.

Coke.—So far this month, specifications for by-product foundry coke are well below the level of October, when a decline from September was reported. In fact, several oven representatives say that shipments on contracts are approximately 30 per cent under the October volume, and a

Warehouse Prices, f.o.b. Cincinnati

	Base per Lb.
Plates and struc. shapes	3.40c.
Bars, soft steel or iron	3.30c.
New billet reinforc. bars	3.15c.
Rail steel reinforc. bars	3.00c.
Hoops	4.05c.
Bands	3.50c.

Squares	4.35c.
Black sheets (No. 24)	4.05c.
Galvanized sheets (No. 24)	4.90c.
Blue ann'l'd sheets (No. 10)	3.45c.
Structural rivets	3.85c.
Small rivets	65 per cent off list
No. 9 ann'l'd wire, per 100 lb.	$3.00
Com. wire nails, base per keg	2.85
Cement c't'd nails, base 100 lb. keg	2.85
Chain, per 100 lb.	8.75
	Net per 100 Ft.
Lap-weld steel boiler tubes, 2-in.	$16.50
4-in.	34.50
Seamless steel boiler tubes, 2-in.	17.50
4-in.	36.00

further decline on the total month's business is anticipated.

Old Material.—With mills curtailing shipments on contracts and refusing to renew as contracts terminate, the district old material market is very weak. Dealers are bidding 25c. less on heavy melting steel, No. 1 busheling and No. 2 wrought and 50c. less on No. 2 busheling than a week ago. The supply of scrap appears to be fairly good, but dealers are having difficulty in moving what they have.

Dealers' buying prices per gross ton, f.o.b. cars, Cincinnati:

Heavy melting steel	$12.50 to $13.00
Scrap rails for melting	13.50 to 14.00
Loose sheet clippings	8.50 to 9.00
Bundled sheets	10.75 to 11.25
Cast iron borings	8.50 to 9.00
Machine shop turnings	8.00 to 8.50
No. 1 busheling	10.00 to 10.50
No. 2 busheling	6.50 to 7.00
Rails for rolling	14.25 to 14.75
No. 1 locomotive tires	14.25 to 14.75
No. 2 railroad wrought	12.50 to 13.00
Short rails	18.00 to 18.50
Cast iron carwheels	12.50 to 13.00
No. 1 machinery cast	18.50 to 19.00
No. 1 railroad cast	15.00 to 15.50
Burnt cast	10.00 to 10.50
Stove plate	10.00 to 10.50
Brake shoes	10.00 to 10.50
Agricultural malleable	14.00 to 14.50
Railroad malleable	15.00 to 15.50

Youngstown

Valley Mills at Lowest Point in Two Years

YOUNGSTOWN, Nov. 19.—Production schedules announced by Mahoning Valley steel companies indicate that activity this week is at the low point for the past two years.

The sheet mills at Haselton of the Sharon Steel Hoop Co. are completely idle for the week, as is the company's open-hearth furnace plant at Lowellville. Its strip mills at Sharon are operating on reduced schedules.

In the Mahoning Valley, only 46 of 120 sheet mills are scheduled, and only 19 of 51 independent open-hearth furnaces. Bessemer steel operations are being carried on at 75 to 80 per cent. In other departments, such as tin plate, strips, steel bars, plates and steel pipe, operations range between 60 and 65 per cent.

Fabricators are maintaining much higher schedules than the primary steel producers.

Buying by the automobile industry has been smaller than anticipated. Expected improvement this month in the buying by Chevrolet Motor Co. and the Ford Motor Co. has failed to develop.

Buffalo

Pig Iron Buying Light, but Shipments Are Well Sustained —Steel Mill Operations Curtailed Further

BUFFALO, Nov. 19.—A demand for prompt shipment on old orders continues to be the feature of the local pig iron market. New business is scarce, but there is a steady flow of requests for iron from melters. Some melters have taken their entire November quota and have dipped into their December tonnage. Stocks of pig iron in producers' yards are the lowest in years, and, at the present rate of operation and consumption, they will be considerably lower by the first of the year. Inquiry is light, with an aggregate of 3000 or 4000 tons, most of which is reported from Canada and which may not be converted into Buffalo business. From lower New York comes an inquiry for 700 tons of foundry and malleable and from New England there is an inquiry for 1000 tons of foundry and malleable. The Eastern base has been cut to $17.50 in some instances. One of the stacks of the Hanna furnace Co. may go out this week, and this, along with the scarcity of stock iron, is expected to keep the market firm.

Prices per gross ton, f.o.b. furnace:

No. 2 fdy., sil. 1.75 to 2.25	$19.50
No. 2X fdy., sil. 2.25 to 2.75	20.00
No. 1 fdy., sil. 2.75 to 3.25	21.00
Malleable, sil. up to 2.25	20.00
Basic	$17.50 to 18.00
Lake Superior charcoal	27.28

Finished Steel.—Operating rates of Buffalo mills are somewhat less than a week ago. The Donner Steel Co. is operating three open-hearths, a reduction of one, and the Lackawanna plant of the Bethlehem Steel Co. is operating at about 65 to 70 per cent. Structural business is quiet, though most of the shops are busy. One lot of 575 tons for a school in the town of Amherst, Erie County, has been placed with a Buffalo fabricator, and a few 50-ton lots have been placed. The market for reinforcing bars is dull, with nothing sizable placed and no volume of small tonnage. About 200 or 250 tons of reinforcing bars will be required for the new county jail at Albany, N. Y.

Old Material.—The market is still trending downward, with heavy supplies of scrap coming out and buying at a minimum. The latest important purchase was last week, when a mill bought a considerable tonnage of No. 1 heavy melting steel at $14.50. It was a direct purchase, and it is believed that a reciprocal arrangement entered into the transaction. The last sale of No. 1 heavy melting steel by a dealer was made at $15. The recent Michigan Central Railroad list brought $14.61, f.o.b. Black Rock, for heavy melting steel. Dealers are paying $14 for No. 1 steel. One of the larger plants, which had held up shipments, has increased its quota to three cars per week from each dealer. Another mill is understood to be offering $14 for heavy melting steel in 500-ton lots. A dealer with an order out for stove plate was able to purchase at $11.75.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$14.50
No. 2 heavy melting steel	13.00
Scrap rails	15.00 to 15.50
Hydraul. comp. sheets	13.00
Hand bundled sheets	11.00 to 11.50
Drop forge flashings	13.75 to 14.00
No. 1 busheling	13.00
Hvy. steel axle turnings	13.50 to 14.00
Machine shop turnings	7.50 to 8.00
No. 1 railroad wrought	13.00 to 13.50
Acid Open-Hearth Grades:	
Knuckles and couplers	17.00 to 17.50
Coil and leaf springs	17.00 to 17.50
Rolled steel wheels	17.00 to 17.50
Low phos. billet and bloom ends	18.00 to 18.50
Electric Furnace Grades:	
Short shov. steel turnings	11.25 to 11.75
Blast Furnace Grades:	
Short mixed borings and turnings	11.25 to 11.75
Cast iron borings	11.25 to 11.75
No. 2 busheling	9.50 to 10.00
Rolling Mill Grades:	
Steel car axles	17.00 to 17.50
Iron axles	20.00 to 21.00
Cupola Grades:	
No. 1 machinery cast	15.00 to 15.50
Stove plate	12.50 to 12.75
Locomotive grate bars	11.00 to 11.50
Steel rails, 3 ft. and under	18.75 to 19.00
Cast iron carwheels	13.00 to 13.50
Malleable Grades:	
Industrial	17.50 to 18.00
Railroad	17.50 to 18.00
Agricultural	17.50 to 18.00
Special Grades:	
Chemical borings	12.50 to 13.50

Birmingham

Southern Furnaces Name $14 Base for First Quarter Delivery in Outside Territories—Steel Buying Improves

BIRMINGHAM, Nov. 19.—Southern furnaces have offered to take orders in St. Louis and other Middle West points at $14 for first quarter delivery, which is the same price that has applied on recent fourth quarter contracts in those territories. It is generally understood that district furnaces will actively solicit first quarter business in competitive territories where a trade has been established in recent months. No district business has been booked beyond the fourth quarter. Current district sales are very light, consisting of small spot orders taken at $14.50, base. A marked decline in shipments occurred last week and some iron is again going into stock piles. The several previous weeks of active shipments reduced backlogs to a low point. The No. 1 Ensley furnace of the Tennessee company was changed from basic to foundry iron on Nov. 9. Of the 16 active

furnaces, nine are on foundry iron, six on basic and one on recarburizing iron.

Prices per gross ton, f.o.b. Birmingham dist. furnaces:

No. 2 fdy., 1.75 to 2.25 sil.	$14.50
No. 1 fdy., 2.25 to 2.75 sil.	15.00
Basic	14.50

Finished Steel.—The market as a whole recovered fairly well last week from the drop in the previous week, and orders are again developing at a good rate. New business in bars, plates and sheets showed a decided improvement in the past few days. Sales of wire products are considered fair for the season. Orders are followed by requests for prompt shipments, as has been the case for some time. There have been no changes in prices during the past three weeks. Structural steel fabricators report a good volume of prospective business for the remainder of the year. No large orders have been booked in the last two weeks. Several important projects requiring reinforcing bars have been withdrawn from the market, and both sales and prospective business are at the low point of the year. The Tennessee company is operating seven open-hearths at Ensley and seven at Fairfield, an increase of one at the latter works. All six continue active at the Alabama City works of the Gulf States Steel Co.

Cast Iron Pipe.—The only new order of importance reported last week was 3000 tons of 12 to 24-in. pipe for St. Petersburg, Fla., let to the United States Pipe & Foundry Co. Bids were opened for small projects at Mendenhall and Tiplersville, Miss. The 4000-ton project at Dallas, Tex., is still pending. Aside from this project, the immediate tonnage in prospect is very light. Less business is coming in from distant territories than in several months. Municipalities have shown no interest in contracting for their 1930 requirements. Shipments are somewhat lighter than two or three weeks ago. Makers are maintaining base prices of $37 to $38.

Coke.—The unconsumed balance of fourth quarter coke contracts is plentiful, consequently there has been very little first quarter contracting so far. Prices remain at $5 a net ton, Birmingham.

Old Material.—Heavy melting steel, steel axles and scrap rails continue to maintain a fair rate of activity considering conditions. Prices are unchanged. Iron scrap prices are nominal owing to lack of trading.

Prices per gross ton, deliv'd Birmingham dist. consumers' yards:

Heavy melting steel	$13.00 to $13.50
Scrap steel rails	14.00
Short shoveling turnings	9.00
Cast iron borings	9.00
Stove plate	11.50 to 12.00
Steel axles	22.00
Iron axles	23.00
No. 1 railroad wrought	10.00 to 10.50
Rails for rolling	15.50
No. 1 cast	13.00
Tramcar wheels	12.50
Cast iron carwheels	13.00 to 13.50
Cast iron borings, chem.	13.50 to 14.00

Boston

Pig Iron Buying Light—Scrap Prices Drop—Warehouses Reduce Nail Quotations

BOSTON, Nov. 19.—Pig iron buying dropped to small proportions the past week. A Massachusetts machinery maker bought 500 tons for first quarter delivery, the Sullivan Machinery Co., Claremont, N. H., 250 tons, and there were numerous smaller lots sold. There is no important inquiry in the market. Prices apparently remain as heretofore. Buffalo stacks report foundries as taking iron on schedule and in some cases anticipating shipments. Other furnaces, however, note some holding up of shipments. While there are some bright spots in New England, the foundry industry in general is not so busy as a month ago, and some plants have laid off men in the past fortnight. Indian iron continues to arrive regularly in small tonnages, but receipts of Dutch iron have gradually tapered off.

Foundry iron prices per gross ton deliv'd to most New England points:

†Buffalo, sil. 1.75 to 2.25	$21.55 to $22.05
†Buffalo, sil. 2.25 to 2.75	22.05 to 22.55
*Buffalo, sil. 1.75 to 2.25	22.41 to 22.91
*Buffalo, sil. 2.25 to 2.75	22.91 to 23.41
East. Penn., sil. 1.75 to 2.25	22.65 to 23.15
East. Penn., sil. 2.25 to 2.75	23.15 to 23.65
Va., sil. 1.75 to 2.25	25.21
Va., sil. 2.25 to 2.75	25.71
*Ala., sil. 1.75 to 2.25	24.11
*Ala., sil. 2.25 to 2.75	24.61
†Ala., sil. 1.75 to 2.25	20.25
†Ala., sil. 2.25 to 2.75	20.75

Freight rates: $4.91 all rail from Buffalo, and $4.05 rail and water; $3.65 all rail from eastern Pennsylvania; $5.21 all rail from Virginia; $9.61 all rail from Alabama and $5.75 rail and water from Alabama to New England seaboard.

*All rail rate.

†Rail and water rate.

Warehouse Business.—Wire nails and poultry staples have been reduced 5c. a 100 lb., making nails $3.20 a keg, base, from stock, and staples $6.05. Domestic mills are meeting more or less competition from German-made nails along the Atlantic seaboard, consequently prices today are 20c. a 100 lb. lower than a month ago. Demand for iron and steel in general is quite good for this time of the year, but individual orders are small.

Fabricated Steel.—The Boston Bridge Works, Inc., was low bidder on the Crawford Street bridge, Providence, R. I., involving 1000 tons of steel. Other bridge work pending includes eight bridges for the Boston & Maine Railroad, another New England railroad bridge, a private project in Vermont, a Boston & Maine Railroad bridge at East Northfield, Mass., and a municipal bridge at Fitchburg, Mass. It is expected that at least 4000 tons of steel for various other projects will be placed before Dec. 1. Competition among fabricators for work is keen, and some low prices are being made.

Old Material.—Further price concessions of 25c. to 50c. a ton are noted in No. 1 heavy melting steel, T and girder rails, forge flashings, blast furnace borings and turnings and chemical borings. The market for steel axles apparently is off $1 a ton, but there is so little doing it is difficult to establish prices. The status of business is the same as a week ago. That is, many owners of material will not sell at prevailing prices, and steel mills apparently require little scrap. Brokers are endeavoring to clean up a few old small orders. The export market is fairly active, but here again low prices quoted have a tendency to discourage offerings.

Buying prices per gross ton, f.o.b. Boston rate shipping points:

No. 1 heavy melting steel	$9.75 to $10.00
Scrap T rails	9.50 to 10.00
Scrap girder rails	8.75 to 9.00
No. 1 railroad wrought	10.00 to 10.50
No. 1 yard wrought	9.50 to 10.00
Machine shop turnings	6.00 to 6.50
Cast iron borings (steel works and rolling mill)	6.00 to 6.50
Bundled skeleton, long	8.75 to 9.00
Forge flashings	8.50 to 9.00
Blast furnace borings and turnings	5.50 to 6.00
Forge scrap	8.50 to 9.00
Shafting	14.00 to 14.25
Steel car axles	16.00 to 16.50
Wrought pipe 1 in. in diameter (over 2 ft. long)	9.00 to 9.50
Rails for rolling	11.00 to 11.50
Cast iron borings, chemical	9.00 to 9.50

Prices per gross ton deliv'd consumers' yards:

Textile cast	$14.00 to $14.50
No. 1 machinery cast	15.00 to 15.25
No. 2 machinery cast	13.00 to 13.25
Stove plate	11.00 to 11.50
Railroad malleable	18.50 to 19.00

Cast Iron Pipe.—The Watertown Arsenal has awarded 150 tons of 6 and 8-in. pipe and fittings to the Warren Foundry & Pipe Co., and Wayland, Mass., 100 tons of 6-in. to the same foundry. Salem, Mass., has placed 100 tons with the United States Pipe & Foundry Co. No other open municipal business is reported, but a sizable aggregate tonnage was placed privately the past week. There is an especially good demand for 4-in. pipe,

Detroit

Automobile Production Trend Continues Downward—Some Plants Shut Down Temporarily for Inventory

DETROIT, Nov. 19.—The production trend in the automotive industry is still downward as inventory time is approached. Some of the plants have already shut down temporarily for inventory taking. It is thought that no change in the curve's present course will occur during the remainder of the year.

Except for the Auburn Automobile Co., which estimates a November output of 1500 cars, as compared with 1251 in October and 1867 in September, no official estimates of the probable production this month by various automobile companies are available.

Schedules are on a hand-to-mouth basis, and are influenced by the volume of retail sales, stocks of new and used cars in dealers' hands and other factors, at present somewhat intangible, which may grow out of the situation resulting from the stock market collapse.

The Chevrolet Motor Co., at Flint, recently shut down its motor and sheet metal departments temporarily for inventory and will soon stop work for a week in its assembly department. The Oakland Motor Car Co., Pontiac, Mich., has resumed operations after a short shutdown for inventory.

Owing to the present condition of the industry, automotive steel demand has been almost negligible. Until first quarter requirements are decided upon, the steel price situation will not become clarified. Steel companies apparently have little disposition to push sales at present, and price concessions probably would be of no avail.

The structural steel market is fairly active for this time of year. Plans are under way for a building for the Detroit *News* which will call for about 5000 tons of steel. The Union League Club of Detroit has started work on a new building in which 1800 tons of steel will be used. There is a fair volume of medium-size projects in the market. Some fabricators are busy, while others are in need of work.

Metal Goods Makers Meet To Form Association

An organization committee has been formed by contract metal goods manufacturers, tool and die makers to work on the establishment of a trade association. A preliminary meeting was held on Oct. 17, and a second organization meeting will be held Nov. 20, at Masonic Hall, 71 West Twenty-third Street, New York, at 7.30 p. m. Heading the committee is Adolph Hopp, 390 Second Avenue, New York.

Automobile Production Declines

WASHINGTON, Nov. 19.—Production of motor vehicles in the United States in October totaled 379,942 units, the lowest output since last December, when the total was 234,116 vehicles, according to reports received by the Department of Commerce from 149 manufacturers. The output in September was 415,697 units. In October, 1928, it was 397,284.

Production of passenger cars in October was 320,327, compared with 364,786 in September, while truck production went up to 58,747, compared with 50,046 in September, and production of taxicabs was 868, against 865.

In the first 10 months, production of motor vehicles in the United States totaled 5,017,806 units, against 3,867,503 for the same period of last year. The increase was 30 per cent.

Output of passenger cars was 4,325,504, compared with 3,399,425, a gain of 27 per cent. Truck production was 677,842, against 463,101 (up 46 per cent) and taxicab production was 14,460, compared with 4,977.

Henry & Wright Mfg. Co. Passes to New Hands

A controlling interest in the Henry & Wright Mfg. Co., Hartford, Conn., has been purchased by executives connected with Stone & Webster, Inc., Boston. At a meeting in Boston on Nov. 14 the following officers and directors were elected: C. J. Sorrells, chairman of board; J. F. Funk, president; W. J. Henry, vice-president; F. H. Farnham, treasurer; D. C. Jewett, secretary. Directors: Richard Harte, W. J. Hopkins, H. G. Philbrook, W. A. Ready, W. J. Henry.

The Henry & Wright Mfg. Co., manufacture the high-speed automatic punch press known to the trade as the Henry & Wright dieing machine. The company is manufacturing presses ranging from 10 to 200-ton capacity, and it contemplates expanding the line to take in presses up to 1000-ton capacity.

Railroad Equipment

Van Sweringen Roads Expected To Inquire for 10,000 Cars

ALTHOUGH railroad car orders the past week were meager and inquiries appeared for only 900 cars, the outlook is promising. The Chesapeake & Ohio and the Pere Marquette are expected to ask for bids on 10,000 cars within a week and the New York Central may pass soon upon its car-building program for next year, which is believed to call for the purchase of about 15,000 cars. The Texas Corporation is taking bids on 500 tank cars, while the St. Louis-San Francisco is inquiring for 300 underframes and a like number of superstructures.

Orders have been placed in the past week for 64 locomotives, of which 20 of the Mikado type are for the St. Louis-San Francisco and 25 are for the Pennsylvania. The Southern Pacific is in the market for 40 locomotives. Details of the week's business follow:

St. Louis-San Francisco is asking for bids on 300 underframes and a like number of superstructures. This road has purchased 20 Mikado type locomotives from Baldwin Locomotive Works.

Texas Corporation is inquiring for 300 insulated tank cars of 10,000-gal. capacity, 150 tank cars of 12,000-gal. capacity and 50 insulated tank cars of 10,000-gal. capacity.

Michigan Central has ordered four oil-electric locomotives from American Locomotive Co.

North American Car Corporation has ordered five tank cars from American Car & Foundry Co.

Pennsylvania Railroad has ordered 25 locomotives from Lima Locomotive Works, Inc.

Boston & Albany is taking bids on 10 locomotives in addition to five ordered from Lima Locomotive Works, Inc.

Kentucky & Indiana Terminal has ordered eight heavy switching locomotives from Lima Locomotive Works.

Southern Pacific is inquiring for 25 mallet type and 15 4-8-4 type locomotives, 300 automobile cars and 100 gondola cars.

Texas South-Eastern has ordered one locomotive from Baldwin Locomotive Works.

Illinois Terminal Co. has ordered one 90-ton combination electric locomotive from St. Louis Car Co.

Baltimore & Ohio has ordered 50 coaches from Pullman Car & Mfg. Corporation.

New York Central is inquiring for 12 rail motor cars.

Great Northern has ordered two dining cars from Pullman Car & Mfg. Corporation.

Northern Pacific will buy nine dining cars.

An inquiry for 10,000 cars for two Van Sweringen roads, the Chesapeake & Ohio and Pere Marquette, is expected within a week.

New York Central is expected soon to pass upon its car-building program for next year. It is believed in the car industry that about 15,000 cars will be on the budget.

Non-Ferrous Metal Markets

Copper Buyers, Expecting Lower Prices, Stay Out of Market—Tin Drifting—Zinc and Lead Firmer

NEW YORK, Nov. 19.

Copper.—In the expectation that prices will decline, as have those of tin, lead and zinc recently, buying by both domestic and foreign consumers continues in light volume both here and abroad. Melters are buying from hand to mouth. Despite this situation, prices continue firm at 18c. for electrolytic copper, delivered in the Connecticut Valley. Sellers continue to be optimistic that the price will stay at the present level. They feel that the matter of inventories alone will have some weight against a lower price in the case of some fabricators. They also feel that, because stocks abroad are at a vanishing point, any betterment in demand will first come from that source. Copper exporters continue to quote 18.30c., c.i.f. usual European ports, and Lake copper is firm at 18c. to 18.12½c., delivered. Curtailment of production at the mines is progressing, but it will be at least two months before its effect is a factor.

Tin.—In a quiet market about 700 tons of spot Straits tin changed hands during the week. Prices have been quite steady, but the market is drifting, with little interest shown by consumers or dealers. The new price for tin plate announced last week, which in the past has generally been the cause of considerable buying of tin, has been without effect thus far. It is possible that consumers are well covered for some time ahead. An interesting item of news is that the official shipments of tin from the Straits from Nov. 1 to 16, inclusive, were 6449 tons, tending to confirm estimates early this month of November shipments of 10,000 tons. The London market has turned stronger, with prices today about £4 to £5 per ton higher than a week ago, with spot standard quoted at £179 7s. 6d., future standard at £182 and spot Straits £183 7s. 6d. The Singapore price today was £185 2s. 6d. In a very quiet market here today, spot Straits was quoted at 39.75c., New York.

Lead.—Inquiry is somewhat better, with sales a little heavier. Prices have remained unchanged for the first week in the last three. Producers in St. Louis are asking 6.10c., and the price of the leading interest is unchanged at 6.25c., New York, as the contract price.

Zinc.—Possibly because belief is growing that the bottom in prices has

THE WEEK'S PRICES. CENTS PER POUND FOR EARLY DELIVERY

	Nov. 19	Nov. 18	Nov. 16	Nov. 15	Nov. 14	Nov. 13

Rolled Products

List Prices, Per Lb., f.o.b. Mill

On Copper and Brass Products, Freight up to 75c. per 100 Lb. Allowed on Shipments of 500 Lb. or Over

Sheets—
- High brass ..... 23.25c.
- Copper, hot rolled ..... 26.75c.
- Zinc ..... 10.50c.
- Lead (full sheets) ..... 10.25c.

Seamless Tubes—
- High brass ..... 28.25c.
- Copper ..... 29.25c.

Rods—
- High brass ..... 21.25c.
- Naval brass ..... 24.00c.

Wire—
- Copper ..... 19.87½c.
- High brass ..... 23.75c.

Copper in Rolls ..... 26.75c.
Brazed Brass Tubing ..... 30.87½c.

Aluminum Products in Ton Lots

The carload freight rate is allowed to destinations east of Mississippi River and also to St. Louis on shipments to points west of that river.

- Sheets, 0 to 10 gage, 3 to 30 in. wide ..... 33.00c.
- Tubes, base ..... 42.00c.
- Machine rods ..... 34.00c.

Chicago Warehouse

(Prices Cover Trucking to Customers' Doors in City Limits)

Sheets—	Base per Lb.
High brass	23.25c.
Copper, hot rolled	27.75c.
Copper, cold rolled, 14 oz. and heavier	30.00c.
Zinc	10.75c.
Lead, wide	11.35c.
Seamless Tubes—	
Brass	28.25c.
Copper	29.25c.
Brass Rods	21.25c.
Brazed Brass Tubes	31.00c.

New York or Cleveland Warehouse

Delivered Prices, Base per Lb.

High brass	21.12½c. to 22.12½c
Copper, hot rolled, base sizes	27.75c. to 28.75c.
Copper, cold rolled, 14 oz. and heavier, base sizes	30.00c. to 31.00c.
Seamless Tubes—	
Brass	26.00c. to 27.00c.
Copper	29.12½c. to 30.12½c.
Brass Rods	18.87½c. to 19.87½c.
Brazed Brass Tubes	29.12½c. to 30.12½c.

New York Warehouse

Delivered Prices, Base per Lb.

- *Zinc sheets (No. 9), casks* ..... 10.75c. to 11.25c.
- *Zinc sheets, open* ..... 11.50c. to 12.00c.

Metals from New York Warehouse

Delivered Prices, Per Lb.

- Tin, Straits pig ..... 41.50c. to 42.50c.
- Tin, bar ..... 43.50c. to 44.50c.
- Copper, Lake ..... 19.50c.
- Copper, electrolytic ..... 19.25c.
- Copper, casting ..... 19.00c.
- Zinc, slab ..... 7.50c. to 8.00c.
- Lead, American pig ..... 7.00c. to 7.50c.
- Lead, bar ..... 9.00c. to 9.50c.
- Antimony, Asiatic ..... 10.50c. to 11.00c.
- Aluminum No. 1 ingots for remelting (guaranteed over 99% pure) ... 25.00c. to 26.00c.
- Alum. ingots, No. 12 alloy ..... 24.00c. to 25.00c.
- Babbitt metal, commercial grade ..... 25.00c. to 35.00c.
- Solder, ½ and ½ ..... 28.00c. to 28.50c.

Metals from Cleveland Warehouse

Delivered Prices, Per Lb.

- Tin, Straits pig ..... 45.00c.
- Tin, bar ..... 47.00c.
- Copper, Lake ..... 19.50c.
- Copper, electrolytic ..... 19.25c.
- Copper, casting ..... 18.75c.
- Zinc, slab ..... 8.00c. to 8.25c.
- Lead, American pig ..... 7.00c. to 7.20c.
- Lead, bar ..... 9.25c.
- Antimony, Asiatic ..... 16.00c.
- Babbitt metal, medium grade ..... 18.00c.
- Babbitt metal, high grade ..... 48.00c.
- Solder, ½ and ½ ..... 28.50c.

Old Metals, Per Lb., New York

Buying prices represent what large dealers are paying for miscellaneous lots from smaller accumulators and selling prices are those charged consumers after the metal has been properly prepared for their uses.

	Dealers' Buying Prices	Dealers' Selling Prices
Copper, hvy. crucible	14.75c.	16.00c.
Copper, hvy. and wire	14.50c.	15.50c.
Copper, light and bottoms	12.50c.	13.50c.
Brass, heavy	8.00c.	9.00c.
Brass, light	6.75c.	7.75c.
Hvy. machine composition	11.50c.	12.50c.
No. 1 yel. brass turnings	9.25c.	9.75c.
No. 1 red brass or compos. turnings	10.75c.	11.75c.

Lead, tea	3.75c.	4.25c.
Zinc	3.25c.	3.75c.
Sheet aluminum	13.00c.	14.00c.
Cast aluminum	11.25c.	13.25c.

been reached, domestic demand for prime Western has been better in the last week, but it is still of a hand-to-mouth character. Consumers' stocks are known to be very low, but they continue to hesitate to commit themselves for the future. A meeting of the European cartel is slated for today, and this may have a sympathetic effect on prices at London so as to strengthen them; if so, this may tend to further stiffen the market here. Prime Western is quoted at 6.25c., East St. Louis, or 6.60c., New York, with concessions for small lots reported here and there. The ore price is again $40, Joplin, but sales last week were light at 5690 tons. Production was still high at 12,000 tons, leaving the surplus estimated at 54,052 tons. Rather drastic curtailment of ore production is reported from the Tri-State district, some properties shutting down for the remainder of the year and some for a shorter period.

Antimony.—In a quiet market Chinese metal for spot and future delivery is quoted at 8.62½c., New York, duty paid.

Nickel.—Ingot nickel in wholesale lots is offered at 35c. per lb., with shot nickel at 36c. and electrolytic nickel in cathodes at 35c.

Aluminum.—Virgin metal, 98 to 99 per cent pure, is quoted at the published price of 23.90c. per lb., delivered.

Non-Ferrous Metals at Chicago

CHICAGO,—Few orders for non-ferrous metals have been taken in the week. Prices for copper, lead and zinc are holding while advances are shown for tin and antimony. A substantial volume of inquiry is developing in the old metal market.

Prices per lb., in carload lots: Lake copper, 18.50c.; tin, 41c.; lead, 6.20c.; zinc, 6.35c.; in less-than-carload lots, antimony, 9.50c. On old metals we quote copper wire, crucible shapes and copper clips, 14c.; copper bottoms, 11.50c.; red brass, 11.50c.; yellow brass, 8c.; lead pipe, 4.50c.; zinc, 3c.; pewter, No. 1, 24.50c.; tin foil, 24c.; block tin, 34c.; aluminum, 12.87½c.; all being dealers' prices for less-than-carload lots.

Non-Ferrous Ingot Metal Unfilled Orders

On Nov. 1, unfilled orders for brass and bronze ingots and billets on the books of the members of the Non-Ferrous Ingot Metal Institute amounted to a total of 12,735 net tons. On Oct. 1 the unfilled orders were 16,246 tons and on Sept. 1 they were 15,065 tons.

Stockholders of the Allis-Chalmers Mfg. Co., Milwaukee, have approved an increase in the common stock to 2,000,000 no-par shares, from 500,000 shares of $100 par value. It is proposed to exchange the present outstanding stock on the basis of four new shares for each common share.

Witherow-Donner Merger Arranged

T. M. Girdler and R. J. Wysor Elected to Donner Board—W. P. Witherow Is Chairman

WITH the acquisition of the Witherow Steel Co. of Pittsburgh by the Otis & Co.-Eaton-Mather group of Cleveland, a merger has been arranged between this company and the Donner Steel Co. of Buffalo, against which company the Witherow company had pending a suit for $1,000,000 damages for alleged patent infringements. The Cleveland group bought control of the Donner company two months ago.

W. P. Witherow will continue as executive head of the Witherow company and will become chairman of the board of the Donner company. William H. Donner, president, and Robert Donner, vice-president of the Donner company, have resigned, severing all connections with the company.

T. M. Girdler, former president of the Jones & Laughlin Steel Corporation, and R. J. Wysor, who was general manager of that company, who resigned recently to join the Otis & Co.-Eaton-Mather interests, have been named members of the Donner board of directors, together with Christopher Baldy, a Buffalo attorney. Until such time as a president for the Donner company is appointed, F. K. Smith, vice-president and treasurer, is the chief executive officer.

The Donner-Witherow merger will be financed without public sale of stock. The Donner company will issue $5,022,000 in new 6 per cent preferred stock to provide for the exchange of securities.

Average Non-Ferrous Ingot Prices in October

CHICAGO, Nov. 16.—The Non-Ferrous Ingot Metal Institute reports the average prices per pound received by its membership on commercial grades of the six principal mixtures of ingot brass during the 28-day period ended Nov. 8. As there are, as yet, no generally accepted specifications for ingot brass, each item listed below is a compilation representing numerous sales of metal known to the trade by the designation shown, but each item, in reality, includes many variations in formulas. Until the program of standardizing the principal specifications, now progressing in cooperation with the American Society for Testing Materials, is completed, the following specifications will be understood to refer to "commercial grades":

	Cents
Commercial 80-10-10 (1% impurities)	17.105
Commercial 78%-metal	14.814
Commercial 81%-metal	15.483
Commercial 83%-metal	15.795
Commercial 85-5-5-5	15.936
Commercial No. 1 yellow brass ingot	12.739

COMING MEETINGS

NOVEMBER

National Founders' Association. Nov. 20 and 21. Annual meeting, Hotel Astor, New York. J. M. Taylor, 29 South LaSalle Street, Chicago, secretary.

New England Council. Nov. 21 and 22. Fifth annual conference, Hotel Statler, Boston.

DECEMBER

American Society of Mechanical Engineers. Dec. 2 to 6. Annual meeting, 29 West Thirty-ninth Street, New York. Calvin W. Rice, 29 West Thirty-ninth Street, New York, secretary.

Taylor Society. Dec. 4 to 6. Annual meeting, Hotel Pennsylvania, New York. H. S. Person, 29 West Thirty-ninth Street, New York, managing director.

National Exposition of Power and Mechanical Engineering. Dec. 2 to 7. Annual exposition, Grand Central Palace, New York. Charles F. Roth, Grand Central Palace, New York, manager.

Steel Founders' Society of America. Dec. 12. William Penn Hotel, Pittsburgh. Granville P. Rogers, 932 Graybar Building, New York, managing director.

Fabricated Steel Makes New High Record

WASHINGTON, Nov. 19.—Orders for fabricated structural steel in October, reported to the Department of Commerce by 180 firms, totaled 265,472 tons, representing 89 per cent of their monthly capacity of 298,725 tons. This compares with orders of 258,984 tons reported by 218 firms in September, representing 83 per cent of their capacity of 313,255 tons.

Computed tonnage booked in October was 342,650 tons, against 319,550 tons in September and 257,950 tons a year ago. Computed shipments were 354,200 tons, or 92 per cent of capacity, against 319,550 tons or 83 per cent of capacity. October shipments were the largest on record, displacing the previous record of 342,650 tons, made last August. In October, 1928, the computed total was 319,550 tons.

For the first 10 months computed bookings were 3,299,450 tons, or 86 per cent of capacity, against 2,798,950 tons or 72 per cent of capacity for the like period of last year. The 10-month total this year is just ahead of the 3,287,900 tons booked in 12 months of 1928, the previous annual record.

Computed shipments in 10 months were 3,022,250 tons, or 79 per cent of capacity, against 2,571,800 tons, or 67 per cent of capacity, last year.

PERSONAL

GEORGE L. DANFORTH, JR., has been made general superintendent at South works of the Illinois Steel Co., succeeding the late Peter A. Newton, whose death was reported in this column Nov. 7. Mr. Danforth, who has been assistant general superintendent at South works since 1918, entered the service of the United States Steel Corporation at its inception.

—

S. H. SLAYMAKER, of Fairbanks, Morse, & Co., Beloit, Wis., has been appointed to head the metals and foundry section of the Rock River Valley Safety Conference, which will meet at Madison, Wis., May 6, 1930, at which it is expected 1200 or more shop foremen and factory and construction executives and safety experts will attend from central Wisconsin and northern Illinois.

—

THOMAS FULLER, formerly manager of the Charlotte, N. C., office of the Westinghouse Electric & Mfg. Co., East Pittsburgh, has been named manager of the company's Atlanta district office, succeeding the late H. A. Coles. He was graduated from the Georgia School of Technology in 1905 and has been identified with the Westinghouse company since 1906.

—

R. L. BINDER, president, Metals Coating Co. of America, Philadelphia, spoke before the New England Railroad Club on Nov. 13, at the Copley-Plaza Hotel, Boston.

—

FREDERICK C. CRAWFORD, for seven years manager of the Detroit plant of the Thompson Products Co., Inc., Cleveland, has been made general manager and first vice-president of the company.

—

O. E. HARDER, professor of metallography, University of Minnesota, addressed the Milwaukee chapter of the American Society for Steel Treating, Nov. 12, on the fundamentals of micrographs.

—

H. S. WARWICK, formerly secretary of the Youngstown Real Estate Board, has been added to the industrial expansion department of the Youngstown Sheet & Tube Co., Youngstown.

—

G. L. SIMPSON, of the Pittsburgh Electric Furnace Corporation, was the guest at the November meeting of the New England Foundrymen's Association, held at the Exchange Club, Boston, Nov. 13.

—

LEON M. LAMB, controller of the Greenfield Tap & Die Corporation, Greenfield, Mass., has been made secretary of a newly-created Massachusetts Industrial Commission by the governor of that State.

W. L. RANIS, of the Union Malleable Iron Co., East Moline, Ill., spoke on sand control in the foundry at the monthly meeting of the Quad-City Foundrymen's Association, held at the LeClaire Hotel, Moline, Nov. 18.

—

RALPH H. CLORE, heretofore in charge of Cincinnati district sales for the United States Electrical Tool Co., has been made sales manager, succeeding GEORGE M. LAWRENCE, who has resigned to become vice-president of the General Radial Drill Co., Cincinnati.

RALPH H. CLORE

—

FRANK FRY has been appointed manager of the New York office of Hausman & Wimmer Co., Pittsburgh, dealer in scrap iron and steel. He has been identified with the company since last July, and previously was with the E. B. Leaf Co., Philadelphia.

—

HALLOWAY KILBORN, treasurer, Kilborn & Bishop Co., New Haven, Conn., will speak at the November meeting of the New Haven chapter of the American Society for Steel Treating at Hammond Laboratory, New Haven, on Nov. 21, on "Forging and Forge Die Design."

—

CARL C. GIBBS, who has been manager of the Indianapolis plant of the National Malleable & Steel Castings Co., Cleveland, has been made assistant to Henry F. Pope, president of the company. He has been succeeded in Indianapolis by STOWELL C. WASSON, who has been sales agent of the company in Indianapolis for the past eight years.

—

FRANK P. WALSH, for the past 14 years in the estimating and sales departments of the Whiting Corporation, Harvey, Ill., has been appointed manager of the newly-opened St. Louis office of the company at 1442 Syndicate Trust Building.

Obituary

LESTER S. CARROLL, vice-president in charge of purchases of the American Locomotive Co., died of a heart attack on a subway train in New York, Nov. 14, aged 61 years. He had been with the company since 1920, after years of experience in the purchasing field with various railroads, having been general purchasing agent for the Chicago & Northwestern at one time.

—

CHARLES B. MOORE, for many years connected with railway supply manufacturing concerns, died Nov. 11. Mr. Moore was chairman of the board of directors of the Oxweld Railroad Service Co., and president of the Ajax Brake Co. He was also a trustee of Lake Forest University, from which he was graduated in 1896.

—

EZRA EDWARD CLARK, for many years identified with the Dean Steam Pump Works, Holyoke, Mass., as designer and construction engineer, and previously associated with E. P. Allis & Co., Milwaukee, died on Nov. 11, at the Newton, Mass., hospital. He was born in Palmer, Mass., Jan. 27, 1858.

—

RICHARD CUSHMAN, formerly superintendent of the Cushman Chuck Co., Hartford, Conn., died at New London, Conn., Nov. 10, aged 41 years. In 1909 he became associated with the chuck company and in 1916 resigned to engage in the musical profession.

—

ROBERT W. FERGUSON, who succeeded to the managership of the New Orleans branch of the Lukens Steel Co., Coatesville, Pa., when Robert W. Wolcott, formerly its manager, was made president of the Lukens company a few years ago, died suddenly Nov. 13.

—

LEE R. FARRELL, aged 45, secretary-treasurer of the Industrial Silica Co., Youngstown, died Tuesday at Tucson, Ariz., where he went several months ago in an effort to regain his health. He was also secretary-treasurer of the Portage Silica Co., and held the same capacities with the Kent Sand & Gravel Co. Mr. Farrell had been identified with the silica business of the Middle-West throughout all of his business career.

—

FRANK A. HUNTER, president, Hunter Saw & Machine Co., Pittsburgh, died at his home in that city on Nov. 19, aged 57 years. With his brother, Harry A. Hunter, he organized that company, and since the death of the former several years ago, had been its president. He had been in ill health for about two years, and a son, F. A. Hunter, Jr., has had charge of the business.

Fabricated Structural Steel

Awards Total 41,000 Tons—Cincinnati Union Terminal Will Require 40,000 Tons

WITH contracts for structural steel amounting to 41,000 tons in the past week and with fresh inquiries put out for almost 60,000 tons, there is ample evidence that the somewhat unsettled business situation has not adversely affected building construction activities. In fact, awards and new work were the heaviest since the latter part of October. It is significant that approximately half of the lettings were for industrial expansion purposes.

The outstanding awards were 12,300 tons for a New York subway section and 6500 tons for a Ford assembly plant at Edgewater, N. J. The feature among inquiries was the taking of bids for the first part of the building of the Union Railroad Terminal at Cincinnati, which will take at least 40,000 tons of steel. Awards follow:

BOSTON & MAINE RAILROAD, 365 tons, signal bridges, to Boston Bridge Works, Inc.

MAYNARD, MASS., 294 tons, American Cyanamid Co. plant units, to a New Jersey fabricator.

FAIRFIELD, CONN., 200 tons, State bridge, to an unnamed fabricator.

ATHOL, MASS., 113 tons, theater, to Eastern Bridge & Structural Co.

DANVERS, MASS., 100 tons, school, to Boston Structural Co.

PROVIDENCE, R. I., 1000 tons, Crawford Street bridge, to Boston Bridge Works, Inc.

NEW YORK CENTRAL RAILROAD, 230 tons, bridge, to American Bridge Co.

NEW YORK, 1800 tons, apartment building at 104th Street and Central Park West, to Easton Structural Steel Co.

NEW YORK, 750 tons, apartment building at 131-135 East Eightieth Street, to Easton Structural Steel Co.

NEW YORK, 350 tons, apartment building at Manhattan Avenue and 106th Street, to J. Klein, Inc.

NEW YORK, 12,300 tons, section 10, route 110, of subway, through Rosoff Subway Construction Co., to American Bridge Co.

BROOKLYN, 5850 tons, Kings County Hospital, formerly reported awarded to Harris Structural Steel Co., to Taylor-Fichter Steel Construction Co.

BROOKLYN, 450 tons, public school No. 199, to Easton Structural Steel Co.

CAMDEN, N. J., 140 tons, Fifth Street vehicular underpass for Delaware River Bridge, to American Bridge Co.

VALLEY STREAM, L. I., 100 tons, airplane hangars, to Jones & Laughlin Steel Corporation.

EDGEWATER, N. J., 6500 tons, assembly plant for Ford Motor Co., to McClintic-Marshall Co.

YONKERS, N. Y., 485 tons, St. John's Riverside Hospital, to Hinkle Iron Works.

BRIGHTON, N. Y., 100 tons, highway bridge, to American Bridge Co.

ELIZABETH, N. J., 600 tons, telephone building, to Hinkle Iron Works.

NEWPORT NEWS, VA., 500 tons, boat plant for Horace E. Dodge Boat & Plane Corporation, to Virginia Bridge & Iron Co.

BALTIMORE & OHIO RAILROAD, 700 tons, bridges, to American Bridge Co.

BROOKNEAL, VA., 265 tons, bridge, to Virginia Bridge & Iron Co.

MEADOWBROOK, W. VA., 800 tons, Grasselli Chemical Co., to McClintic-Marshall Co.

CLEVELAND HEIGHTS, 370 tons, Monticello School, to Niles Forge & Mfg. Co.

DETROIT, 550 tons, Elks Temple, to R. C. Mahon Co.

FORT WAYNE, IND., 430 tons, theater, to Central States Bridge Co.

FORT WAYNE, 180 tons, building for Joslyn Mfg. & Supply Co., to Indiana Bridge Co.

STATE OF ILLINOIS, 1650 tons, Welfare Building, to Mississippi Valley Structural Co.

CHICAGO, 140 tons, alterations to *Tribune* Tower, to Duffin Iron Works.

PROVISO, ILL., 500 tons, high school, to Mississippi Valley Structural Steel Co.

KANSAS CITY, MO., 1200 tons, Phillips Hotel, to Kansas City Structural Steel Co.

DENVER, 550 tons, Publix Theater, to E. Burkhardt Sons Steel & Iron Works, local.

STATE OF OKLAHOMA, 1150 tons, Pack Saddle bridge across South Canadian River, to Lakeside Bridge & Steel Co.

EVERETT, WASH., 1400 tons plates, 36- to 48-in. welded steel pipe line, to Steel Tank & Pipe Co.

WOODLAND, WASH., 120 tons, bridge for Northwest Electric Co., to Wallace Bridge & Structural Steel Co.

PORT ANGELES, WASH., 300 tons, pulp mill for Olympic Forest Products Co., to Isaacson Iron Works.

BREMERTON, WASH., 625 tons, Bremerton bridge, to Wallace Bridge & Structural Steel Co.

TACOMA, WASH., 2400 tons, Eleventh Street viaduct, to Poole & McGonigle.

PHOENIX, ARIZ., 170 tons, bridge on Holbrook-Lupton highway; general contract to F. D. Shufflebarger, Albuquerque, N. M., steel to unnamed bidder.

PORTLAND, ORE., 100 tons, hangar on Swan Island, to Poole & McGonigle.

SAN FRANCISCO, 350 tons, warehouse for Western Sugar Refining Co., to California Steel Co.

SAN FRANCISCO, 300 tons, factory for Link-Belt, Meese & Gottfried Co., to Pacific Coast Engineering Co.

SAN FRANCISCO, 150 tons, apartment building, Sixteenth and Clement Streets, to McClintic-Marshall Co.

SAN FRANCISCO, 100 tons, apartment building, Fifteenth Avenue and West Portal Street, to McClintic-Marshall Co.

BAKERSFIELD, CAL., 120 tons, telephone building, to Judson-Pacific Co.

BAKERSFIELD, 185 tons, Haberfelde Building, to McClintic-Marshall Co.

LOS ANGELES, 175 tons, warehouse for Crane Co., to Consolidated Steel Corporation.

YORBA LINDA, CAL., 125 tons, packing plant, to Pacific Iron & Steel Co.

SACRAMENTO, CAL., 738 tons, Shasta River bridge, to Minneapolis-Moline Power Implement Co.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

SOMERVILLE, MASS., 100 tons, ice manufacturing plant.

NEW YORK, 5150 tons, section 3, route 110, of subway in Brooklyn; readvertised for bids which are due Dec. 3.

NEW YORK, 3200 tons, loft building at Seventy-sixth Street and Madison Avenue.

NEW YORK, 1450 tons, two apartment buildings at 431 East Fifty-first and on East Fifty-second Street.

NEW YORK, 330 tons, widening of Washington bridge.

NEW YORK, 1250 tons, building at Fifth Avenue and Fifty-seventh Street.

PENNSYLVANIA RAILROAD, 375 tons, bridge at Shinnecock, Long Island.

ERIE, PA., 300 tons, building for Mutual Telephone Co.

AUBURN, N. Y., 400 tons, building for Firth Carpet Co.

RICHMOND, VA., 2000 tons, warehouse for American Tobacco Co.

DETROIT, 5000 tons, building for Sharer estate.

DETROIT, 2000 tons, Union League Club.

FLINT, MICH., tonnage unstated, power house for Dow Chemical Co.

CLEVELAND, 1500 tons, National Town and Country Club building, Thompson, Starrett & Co. general contractors.

CINCINNATI, 40,000 tons, Cincinnati Union Terminals Co.; first inquiry out for unstated tonnage in connection with this project.

CHICAGO, 1000 tons, Twelfth Street bridge.

Reinforcing Steel

Awards, Totaling 2500 Tons, Are Exceptionally Light

REINFORCING steel lettings, amounting to 2500 tons, reflect a seasonal slackening in construction work. The largest awards were 575 tons for a school at Amherst, N. Y., and 550 tons for an industrial plant at Chicago. Fresh inquiries are very light, totaling only 1200 tons. Awards follow:

STATE OF CONNECTICUT, 200 tons, road work, to Concrete Steel Co.

AMHERST, N. Y., 575 tons, school, to R. S. McMannus Steel Construction Co.

CHICAGO, 550 tons, for Grigsby-Grunow Co., 200 tons to Kalman Steel Co. and 350 tons to Olney J. Dean & Co.

SPRINGFIELD, ILL., 450 tons, State buildings, to Inland Steel Co.

SAN FRANCISCO, 100 tons, apartment building, Union Street, to W. C. Hauck & Co.

TACOMA, 155 tons, penstocks for Lake Cushman project, to Northwest Steel Rolling Mills.

SEATTLE, 100 tons, store for Firestone Tire & Rubber Co., to Northwest Steel Rolling Mills.

PORTLAND, ORE., 100 tons, hangar, Swan Island, to Mercer Steel Co.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

ALBANY, N. Y., 200 tons, County jail.

CLEVELAND, 120 tons, repeater buildings for American Telephone & Telegraph Co.

SPRINGFIELD, ILL., 150 tons, addition to Centennial building.

GRANITE CITY, ILL., 130 tons, St. Elizabeth's Hospital.

LOS ANGELES, 125 tons for city; bids Nov. 19.

SACRAMENTO, CAL., 317 tons, paving work in Imperial County; bids Dec. 4.

Sales Cartel Planned for Continent

British Costs Bother Pig Iron Makers—Germany Using More Aluminum—Aircraft Engine Builders Busy

(*By Cable*)

LONDON, ENGLAND, Nov. 18.

DOMESTIC demand for Cleveland pig iron is well sustained and likely to increase, as the Furness Shipbuilding Co., Ltd., has secured orders for seven large, all-British tank ships. Export sales are restricted by the high price, but makers' stocks are all sold and current output is going into consumption.

Hematite prices are firm and makers are well sold into February, asking up to £4 1s. ($19.64) a ton, but accepting tonnage for delivery before the end of the year at £3 18s. ($18.90) a ton.

New business in finished iron and steel is quiet, but specifications are coming in freely against domestic orders which were placed prior to the meeting of the steel makers' committee and mills are generally well engaged.

Export business still lags, but inquiry is more promising. The British Steel Makers' Export Committee, which handles large export orders in certain markets, is likely to form a central sales office in London.

The Government is meeting the employers' and workers' executives in the shipyard dispute on Nov. 19, when it is hoped that a lockout will be averted.

British exports of pig iron in October were 36,000 tons, of which the United States received 1300 tons. Total exports of iron and steel were 390,500 tons.

Tin plate business is steady and prices are likely to advance if the tin market rises materially, as makers are well sold ahead and current unfilled orders are the largest in a number of years. Some mills are booked well into the first half of next year. New business is fair with heavy Far Eastern demand for light, 14 x 20-in. tin plate, because of restricted supplies.

Galvanized sheet orders are small, but scattered, with Indian demand poor. Japanese makers are reported outbidding British mills on Indian orders for No. 24-gage galvanized sheets and are offering increasing competition in China and Africa. Black sheets are inactive in the Japanese specifications and prices have been reduced.

Continental markets have been steadied as a result of the International Steel Cartel's output restriction plans, so that with makers receiving sizable orders some mills are naming 12 to 14 weeks as the earliest delivery. British consumers are buying lightly, especially as the British sheet trade is very quiet.

British Pig Iron Costs High —Export Trade Small

LONDON, ENGLAND, Nov. 8.—The iron and steel trade remains in small volume. The tone of the pig iron market, particularly on the North East Coast, is improved, with consumers showing slightly less caution in placing orders. Makers, however, are dissatisfied with current prices, as production costs continue to rise steadily. In the Cleveland district, blast furnaces are well engaged for the current month, but there has not been much forward buying and, as a result, Bolckow, Vaughan & Co., Ltd., is blowing out one furnace. Stocks of Cleveland iron are small, so that makers are able to maintain their prices, but merchants with low-priced contracts are selling at slightly less than the furnaces. Most of the demand has been from domestic sources, since foreign buyers are reluctant to pay present prices, especially in view of the weaker tone on the Continent.

Hematite furnaces have been able to sell some good tonnages abroad, especially in Southern Europe, and have advanced their prices to £3 18s. ($18.95) per gross ton for East Coast, mixed numbers, which is still considered about 2s. (49c.) less than cost. Coke is scarce, with prices rising steadily, 24s. ($5.83) a ton having

been paid for Durham coke of good average quality.

In high-quality semi-finished steel, domestic makers, particularly in Sheffield, are supplying the bulk of British requirements, but most of the business in ordinary crude steel has gone to Continental makers, the recent recession of the market having made their prices attractive.

Producers of finished products have little new business except for certain domestic construction and engineering orders. Export is difficult with keen competition on the Continent, and most of the export business now being booked is with Colonial railroads, shipping companies and Government departments. Decision of the International Steel Cartel to restrict its production quota by 10 per cent is expected to aid in advancing Continental prices, which should result in some increase of business abroad for British sellers.

German Builder of Wasp and Hornet Motors Busy

HAMBURG, GERMANY, Nov. 4.—The Bayrische Motorenwerke A. G., Munich, which builds the Wasp and Hornet motors under license from the Pratt & Whitney Aircraft Corporation, has had substantial motor sales in Germany and for export. Orders from abroad have been from Asia and Mediterranean countries and, added to a good domestic business, have permitted full operation, which is expected to continue until July, 1930.

This company is also building the British Austin automobile motor and has introduced on the German market a new design of small car with 775 cu. cm. cylinder volume. This model is being sold at a low price with considerable success and is a direct competitor of the popular small car of the Opel works, controlled by the General Motors Corporation.

Gain in Exports of Wood-Working Machinery

Foreign markets for American sawmill and wood-working machinery have been gradually expanding during the past few years. With the exception of a slight drop in 1926, exports have tended steadily upward, according to the Industrial Machinery Division, Department of Commerce. They totaled more than $3,200,000 in 1928, compared with $2,560,000 in 1927, $2,434,000 in 1926 and $2,446,000 in 1925.

Canada is by far the best customer for American sawmill and wood-working machinery, in 1928 accounting for 22 per cent of the total. The United Kingdom ranks next, taking American sawmill machinery to the value of $457,000 last year. Sales to Russia, after averaging about $40,800 during the preceding three years, rose suddenly to more than $275,000 in 1928. Both the Philippine Islands and Australia bought well over $200,000 worth last year.

Europe Plans Sales Cartel

Continental Mills Agree to Cooperate in Effort to Form Large Export Sales Organization

DÜSSELDORF, GERMANY, Nov. 11.—That the long sought and much discussed selling organization for the International Steel Cartel may take form before the end of this year appears possible from the fact that the committee working on such an organization finally gained the consent of all cartel members last month and will introduce its formal proposal at the next meeting. It is generally realized in the cartel, especially in Germany, that the present plan of a maximum quota for each member country fails when business is good, as it is impossible to fix a fine that a member is not willing to pay when the possibility of additional business appears.

The plan in its preliminary form calls for four subsidiary cartels, grouping the membership of the International Steel Cartel, as follows: Group No. 1, Germany and the Saar; Group No. 2, Belgium; including Luxemburg; Group No. 3, France; and Group No. 4, Austria, Czechoslovakia and Hungary. A central sales office is proposed in Luxemburg, or some Swiss city, and export prices will be maintained as firmly as possible. A domestic cartel in a member country will not be permitted by the selling cartel to revise its prices without the consent of the other three groups.

The sales cartel will control export prices of semi-finished steel, bars, plates, beams, rods and Thomas quality structural shapes. Provision has not been made to include cold rolled hoops and sheets thinner than 3 mm., open-hearth structural steel, or products already internationally controlled, such as tubes and rails.

The allotment for each of the four groups in the cartel will be on the basis of the exports of each group in 1929. Should orders be accepted in excess of these allotments they will not be subject to a fine, but will be distributed pro-rata to all members. An interesting feature is the proviso that each group in the cartel must forward a copy of its contracts to the central selling office, which will keep the contracts in a confidential record, not available to the members of other groups. The sales organization has full authority over all contracts.

It will not be the purpose of the selling cartel to establish sales offices abroad and agents will be appointed only in certain European markets, such as London, Rotterdam and Antwerp. As in the past, it is intended to execute overseas business through the mills' own sales offices, or through exporters and importers. In the case of exporters it is planned to give uniform trade discounts based on quantities purchased. For example, these will range from 2.50 per cent to 5 per cent on bars.

While this proposal has not become effective, all members of the International Steel Cartel have agreed to cooperate on the basis of these conditions, which may be altered in certain details before becoming effective.

Large Mills Force Renewal of German Cartels

DÜSSELDORF, GERMANY, Nov. 4.—It appears probable that the German domestic syndicates in the steel industry will be generally renewed for another five years on or before Dec. 20.

At the meeting of the cartels Oct. 28, it was agreed that all domestic syndicates should terminate at one time on Jan. 31, and Dec. 20 was fixed as the latest date at which new agreements for their continuation could be negotiated. Consequently, should any cartel not be renewed, the members could immediately begin selling for delivery after Jan. 31 without being subject to any control. This decision was reached despite vigorous opposition from the smaller producing members of the cartels, who have ceased to maintain sales organizations, having become entirely dependent upon their cartel for distribution. These members would, therefore, be forced to assemble a sales personnel and begin selling direct in about six weeks. The larger producing members have their own sales departments, which could be rapidly increased to whatever size proved necessary.

Setting an early date for renewal of the various cartels is believed by many to have been purposely adopted by the larger producers to force the small plants to abandon their demands for increased allotments and special conditions, which were proving obstacles to renewal. It has evidently served the purpose intended and about the only remaining question to be settled before general renewal of the agreements is the allotment to be given to the Friedrich Krupp A.G., Essen.

Foreign Steel Sold in Japan on Price and Delivery

YOKOHAMA, JAPAN, Oct. 15.—Inquiry for finished steel has increased considerably as a result of building construction and repairs and bridge work. Much of this business is going to importers of foreign material, despite domestic producers' need of tonnage. The reason is said to be the uncertainty of deliveries from the Government works and other Japanese mills, especially when forward shipment is specified, and a slight advantage in price in favor of imported material. Shapes are available at £6 14s. per ton (1.47c. per lb.), c.i.f. Japanese port.

German Tariff Trend Upward

Advocates of Higher Duties Point to Example Set by United States—High Automotive Duties

BERLIN, GERMANY, Oct. 25.—The tariff bill under consideration in the American Congress has supplied propaganda to high-protection advocates in Germany, and various proposals for downward revision of the German tariff have been temporarily shelved. The so-called "minor" tariff of August, 1925, which provided for considerable increases in the duties on automotive products, typewriters, cash registers and other leading American export items, was scheduled to expire Dec. 31, this year. It is now believed that it will be extended.

Following the Geneva Economic Conference in 1927, the Cabinet introduced a bill reducing the duties on 141 items in the tariff, but this bill has not been passed and is considered dead. During the summer, duties on wheat, barley and other American export foods were advanced and when the commercial treaty with Sweden expires further advances in these rates will probably be made. A duty is likely to be imposed on raw aluminum, which is at present duty free but on the import prohibition list, to be brought in only under license.

As the Reichstag in committee has decided to ratify the Geneva convention resolution abolishing import and export prohibitions, a duty on aluminum is regarded as essential to prevent the United States and Canada from swamping the German market. Although German public opinion still appears to favor lower tariffs, agitation from industries that claim to be threatened by low-priced foreign products is strong.

Canada to Consider New Iron and Steel Tariffs

The Advisory Board on Tariff and Taxation of Canada has published its new suggested schedule of iron and steel products made in Canada or imported into the Dominion. The revised schedule comprises thousands of articles into which iron and steel products enter. No tariff rates are entered on the new schedule, these being for the minister of finance to decide and include in his budget.

The board on Nov. 26, will open its most important hearing since its inception. The entire schedule will be dealt with at the hearing, which will continue for several weeks.

The new schedule, which comprises a book of 84 pages, is to be circulated throughout Canada to any manufacturer, producer or consumer who desires it. The Canadian Manufacturers' Association will send out about 4500 copies to its members. Any business man or manufacturer who believes his business will be affected in any way will have the right to make his own representations to the board, either by mail or personally. No sworn evidence is taken, but the board asks for facts to substantiate claims.

The iron and steel schedule has not been revised since 1906 and upon evidence at the hearing tariff charges in the next budget will be based.

After the hearing the evidence will be laid before the minister of finance and with the tariff experts of the board and of the Department of Finance the new rates will be agreed upon.

German Aluminum Demand Increasing

HAMBURG, GERMANY, Nov. 4.—Despite recent increases in the capacity of aluminum producing plants in Germany, requirements are such that there are almost no existing stocks. It is estimated that the 1929 output of aluminum may exceed the 1928 figure of 35,000 tons by 7000 to 8000 tons. The question of a duty on aluminum has not yet been decided, but aluminum producers have agreed not to advance the domestic price of aluminum beyond the world market level.

Japan Expects to Buy Less Indian Iron

YOKOHAMA, JAPAN, Oct. 15.—Importation of Indian pig iron may be reduced to a minimum during the coming year, if the new 500-ton blast furnace at Yawata is ready for operation as soon as expected. Of the 1,000,000 tons of pig iron annually required by the Government works, about 100,000 tons has been bought from the South Manchuria Railroad Co. furnace at Anzin, Manchuria. With the new Government Works furnace in operation, the company will be self-supplying, which will leave the Anzin pig iron for sale in the open market to other Japanese consumers, who are now using imported iron, principally from India.

German Wire Rod Cartel May Lower Prices

HAMBURG, GERMANY, Nov. 4.—With its members unable to agree on allotments and methods to meet outside competition, the German Wire Rod Cartel is faced with serious difficulties. A number of members of the cartel are advocating further price reductions in view of the lower market for wire and wire products. It is pointed out that reduced wire prices for export have stimulated business in the United Kingdom and that British wire mills which largely use Continental wire rods have been unable to reduce their prices on wire. The margin for conversion of wire rods into wire has recently been narrowed by 15s. to 25s. ($3.63 to $6.05) a ton.

A reduction in wire rod prices would aid British and other foreign consumers to meet present market prices on wire, it is argued, and would result in an increase in wire rod exports. Although the official price of the cartel is still £6 5s. ($30.37) a ton, f.o.b. Antwerp, concessions of 1s. to 2s. (24c. to 48c.) a ton have been made on recent sales.

German Tube Prices Exceed British and American

HAMBURG, GERMANY, Nov. 4.—Members of the German Tube Syndicate are protesting against present export prices of that organization. The quotations are slightly higher than the prices of American and British mills, but the syndicate explains this unusual situation by the statement that Germany has exceeded its quota in the International Tube Cartel and must reduce export sales until British and American works have reached their allotment.

The producers and sellers of tubes point out that this policy has resulted in curtailment by certain mills and has forced German exporters to place desirable export business with mills in France, Belgium and the Saar. It it further claimed by the tube mills that, although all the important world producers are in the cartel, except certain makers in Spain, Italy and Poland, the market is not effectively controlled and cartel prices are continually shaded by outsiders as well as by other member countries.

Cartel Quota Reduction May Not Aid Business

PARIS, Nov. 6.—Action of the executive committee of the International Steel Cartel in hastily meeting on Oct. 30, and recommending a 10 per cent reduction in all quotas, effective Nov. 1, equivalent to 3,250,000 tons, is attributed to the cancellations of export orders following the first American stock market break. There has been a steady decline in domestic demand since August, but Belgian and certain German mills have been insisting on full output because of their export business. It is believed in some quarters that the recent 10 per cent reduction has come too late to cause improvement and without some unexpected favorable change, another reduction may be necessary in January.

The Federal Trade Commission has authorized the holding of a trade practice conference with the fire-resisting safe industry. A time or place has not yet been determined. Commissioner C. W. Hunt will preside at the meeting.

Machinery Markets and News of the Works

Sales Continue at Fair Rate

Usual Tapering Off at End of Year, However, Is Becoming Apparent

IN view of the unsettled situation which has resulted from the recent deflation of security values, machine tool sales have been fairly good, although the total volume is running somewhat behind that of October.

In this connection, however, it must be remembered that business booked by tool builders usually tapers off during the last two months of the year and that some letdown was apparent even before the stock market collapsed. It is significant that few, if any, cancellations of orders are reported by the industry.

Aside from rather sharp curtailment in radio manufacturing and a less drastic paring down of production in electric refrigerators and one or two other luxury or semi-luxury lines, metal-working plants have not been seriously affected by the stock debacle. Many companies are going ahead with their plans for the future, despite the possibility of some business reaction. It is not unlikely, however, that some machine tool buying that would have been done this year will be postponed until an adequate appraisal of the industrial trend can be made.

Most purchases in the past week have been confined to one or two machines each, but orders in the aggregate have kept the total volume at a moderate level. The Thew Shovel Co., Lorain, Ohio, has an inquiry out for a number of tools. Some business is coming from tire mold makers who are preparing for next year's production.

Deliveries on some lines of tools have shortened, but generally delivery dates still extend well into 1930.

Orders booked in October by members of the National Machine Tool Builders' Association showed a gain of 34 per cent over September, the association's index rising from 240.8 in September to 322.2 in October. The improvement was sufficiently pronounced to turn up again the three months' average index, which now stands at 287. Shipments were heavy during the month, cutting down unfilled orders to less than two and a half times the current rate of shipments.

New York

NEW YORK, Nov. 19.—Aside from rather sharp curtailment in radio manufacturing and a less drastic paring down of manufacturing programs in electric refrigerators and one or two other luxury or semi-luxury lines, the metal-working manufacturing industries of the New York district have not materially been affected by the recent stock market deflation. Machine tool salesmen who have canvassed the situation report that many companies are going ahead with their plans for the future, despite the possibility of some business reaction. Sales of machine tools have fallen off to a marked extent in the past week, and inquiries also are fewer, but in any event some letdown would have been apparent as the year comes to an end.

Records of machine tool sales show that business has nearly always tapered off in the last two months of each year, 1928 having been an exception. In many instances manufacturers have postponed prospective purchases until after Jan. 1, but some of these postponements had been decided upon before the deflation of security values had injected a new element in the situation. No cancellations of orders are reported in this district. Deliveries of some lines of machine tools have shortened moderately, but except for lathes, which are obtainable from some makers in two or three weeks, many delivery dates extend into January or later.

Department of Street Cleaning, Municipal Building, New York, and 68 Hunterspoint Avenue, Long Island City, has plans for one-story equipment storage, service and repair shop at Long Island City, to cost about $150,000 with equipment.

Atlantic Basin Iron Works, Inc., 168 Van Brunt Street, Brooklyn, has awarded general contract to Gibbons Co., 343 Columbia Street, for rebuilding part of plant recently damaged by fire, comprising two-story shop unit, to cost about $45,000 with equipment.

J. E. Kelly & William Cain, 45 South Broadway, Yonkers, N. Y., architects, have filed plans for an automobile service, repair and sales building on South Broadway, to cost $165,000 with equipment.

Richfield Oil Corporation of New York, Inc., Chanin Building, New York, a subsidiary of Richfield Oil Corporation, Los Angeles, Cal., has acquired former storage and distributing plant of Petroleum Terminal Corporation, Bayonne, N. J., for Eastern plant for tank vessels from California properties. Company has also purchased similar plant of Municipal Service Real Estate Co., Inc., Newtown Creek, Brooklyn, for service in that district. Plans are under consideration for extensions and improvements in properties. C. M. Fuller is president of parent organization.

New York City Airport, Inc., care of Lawrence Halleran, Halleran Agency, 63 Broadway, Flushing, L. I., will take bids in about 60 days for airport buildings on field now being established at College Point, L. I., including hangars, machine shop, oil storage and other units, to cost more than $500,000 with equipment.

Paramount Cab Corporation, 730 Fifth Avenue, New York, has leased former Chrysler service station at 637-47 West Fifty-seventh Street, totaling 37,500 sq. ft. floor space, for new service, repair and garage unit for taxicabs, with machine shop and parts department.

A. H. Grebe & Co., 70 Van Wyck Boulevard, Richmond Hill, L. I., manufacturers of radio sets and equipment, parts, etc., has leased additional space in Bush Terminal, First Avenue, Brooklyn, for storage and distribution, releasing space heretofore used at factory for this purpose, and which will be used for increased facilities for manufacture of radio receivers and parts.

Board of Education, Schenectady, N. Y., is considering installation of manual training equipment in three-story high school in Mount Pleasant section, to cost more than $250,000, for which bids are being asked on general contract until Dec. 14. R. L. Bowan, 207 State Street, is architect.

Wilchik & Kline, Inc., New York, manufacturer of paper boxes and containers, has leased floors in building at 190-2 Greene Street, and will occupy for new plant.

Board of Trustees, Industrial Institute of Brooklyn, 26 Court Street, will take bids in about 60 days for new industrial school on 35-acre tract recently acquired at Toms River, N. J., to cost over $100,000 with equipment. Walter S. Schneider, 1757 Broadway, New York, is architect.

Hubeny Brothers, 617 East First Avenue, Roselle, N. J., machinists, have asked bids on general contract for one-story addition to machine shop, to cost close to $25,000 with equipment. W. L. Finne,

1201 East Grand Street, Elizabeth, N. J., is architect.

Salmon Brothers, Netcong, N. J., road contractors, have purchased municipal stone-crushing plant at Newton, N. J., inactive for several years, and will remodel for branch plant, including installation of conveying, loading and other mechanical-handling equipment.

Driver-Harris Co., Middlesex Street, Harrison, N. J., manufacturer of wire products, has authorized construction of power plant for new two and three-story factory group, to cost about $40,000 with equipment. Entire project will cost over $350,000. J. A. Finegan, 776 Broad Street, Newark, is architect.

Spanjer Brothers, Inc., 198 Badger Avenue, Newark, manufacturer of signs and displays, has purchased two-story factory at 267-71 Mount Pleasant Avenue, for new plant to replace former works recently destroyed by fire and which will not be rebuilt at this time, as previously reported.

Thomas A. Edison, Inc., West Orange, N. J., will discontinue manufacture of standard size talking machines and parts, and will use space at plant heretofore given over to such production for manufacture of radio equipment, as well as combination electric talking machines and radio sets. R. R. Karsh is vice-president.

Shell Eastern Petroleum Products, Inc., 122 East Forty-second Street, New York, a subsidiary of Shell Union Oil Co., St. Louis, will soon begin work on oil storage and distributing plant at East Rutherford, N. J., with machine shop, to cost over $140,000 with equipment.

Truscon Steel Co., Youngstown, has opened a new warehouse at Harrison, N. J., 75 x 210 ft. It maintains an office at 605 Broad Street, Newark.

New York Central Railroad Co., 466 Lexington Avenue, New York, has awarded general contract to J. F. Fitzgerald Construction Co., 38 Chauncy Street, Boston, for addition to engine house, with repair facilities, at Utica, N. Y., including improvements in present structures, to cost over $50,000 with equipment. F. B. Freeman is chief engineer.

New England

BOSTON, Nov. 19.—Industrial New England apparently has not felt the recent stock market slump to any appreciable extent. Sales of machine tools have been in fairly good volume. A number of local sellers will make a good November showing, even though orders during the remainder of the month are not large. Orders have come from all parts of the territory. Demand for used tools and small tools has also held up well.

Springfield Bronze & Aluminum Co., Springfield, Mass., will soon start work on a one-story addition, 60 x 82 x 142 ft. A molding department will be installed.

City of South Norwalk, Conn., has plans for a junior high school, with manual training department, to cost $350,000.

Hartford Empire Co., Hartford, Conn., has taken bids for a one-story steel storage building, 40 x 100 ft. Overhead conveying equipment will be required.

Wood Hydraulic Hoist & Body Co., 316 North Beacon Street, Boston, has filed plans for an addition to cost about $25,000 with equipment. Headquarters are at 7924 Riopelle Avenue, Detroit.

Somerville Auto Body Co., 643 Broadway, Somerville, Mass., has plans for one-story factory, 75 x 100 ft., to cost about $45,000 with equipment.

Following acquisition of controlling interest in Indian Motorcycle Co., Springfield, Mass., a few months ago by Charles A. Levine, New York, and associates, ownership has reverted to local group headed by J. Russell Wait, who will again become president of company. Plans for developments in airplane manufacture, as first proposed, will not be carried out, but production will be concentrated on motorcycles and parts, as well as on outboard gasoline engines for boats.

E. W. Carpenter Mfg. Co., Railroad Avenue, Bridgeport, Conn., manufacturer of wire goods, sheet metal stampings, dies, etc., has awarded general contract to Hewlett Co., 886 Main Street, for a one-story addition, 60 x 200 ft., to cost over $50,000 with equipment. Fletcher-Thompson, Inc., 542 Fairfield Avenue, is architect and engineer.

General Box Co., Winchendon, Mass., manufacturer of wire-bound boxes, crates, etc., has plans for a two-story addition, 60 x 160 ft., to cost about $45,000 with equipment. Thompson & Lichtner Co., Inc., Statler Building, Boston, is architect. Headquarters are at 508 North Dearborn Street, Chicago.

Lamb & O'Connell Shipyard, Squantum, near Quincy, Mass., plans rebuilding part of plant recently destroyed by fire.

Officials of Whitin Machine Works, Inc., Whitinsville, Mass., manufacturer of textile machinery and parts, and Oscar Kohorn & Co., Chemnitz, Germany, manufacturers of machinery for rayon mills, have organized Whitin-Koborn, Inc., to produce rayon machinery in United States under Koborn patents. Part of Whitinsville plant will be given over to this line. New company will also arrange for service and repair units in different parts of country for rayon mills using its equipment. E. K. Swift, treasurer and general manager of Whitin company, will be president of new organization; P. K. Uhleman is secretary and treasurer.

The Crane Market

THERE is a fair volume of pending inquiry for locomotive cranes, most of which is from large industrial users. In the past week the Tidewater Oil Co., New York, has closed on a 25-ton locomotive crane with the Browning Crane Co. In the overhead crane field there is a tendency on the part of buyers to postpone action until they feel that the future trend of business is more definitely determined. These prospective buyers are, as a rule, maintaining a fair rate of operation, although somewhat less than in the first half of the year. The Phoenix Utility Co., 71 Broadway, New York, has a 25-ton, 1-motor, overhead crane to buy and the Standard Oil Co. of New Jersey is inquiring for a 3-ton hand power crane for export.

In the Pittsburgh district a number of crane orders have been placed, but new business has declined rather sharply since the first of the month. The Westinghouse Electric & Mfg. Co., East Pittsburgh, is inquiring for six 3-ton to 5-ton electric traveling cranes.

Among recent purchases are:

Roger Daoust, Defiance, Ohio, gasoline operated crawl-tread crane from Orton Crane & Shovel Co.

Keeport Stone & Lime, Inc., Logansport, Ind., 22-ton, steam operated locomotive crane from Orton Crane & Shovel Co.

H. D. Conkey & Co., Mendota, Ill., report the following recent orders for overhead equipment: National Carbide Corporation, Keokuk, Iowa, 5-ton, 38-ft. span, 3-motor crane; Dallas Brass & Copper Co., Chicago, 6-ton, 27-ft. 6-in. span transfer crane; Kansas City, Kan., 5-ton, 27-ft. 10-in. span hand power crane; Consolidated Paper Co., Monroe, Mich., 10-ton, double girder hand power crane; General Alloys Co., Champaign, Ill., 5-ton, 46-ft. 10-in. span, 3-motor, double girder crane; Buckeye Coal Co., Nemasolin, Pa., 5-ton, 23-ft. 6-in. span hand power crane; Truscon Steel Co., Youngstown, 2-ton, 35-ft. span single I-beam electric crane; Sauerman Brothers, Chicago, 10-ton, 27-ft. 4½-in. span, double girder electric crane and 1½-ton mast type jib crane; Penn Railroad Co., Crestline, Ohio, 10-ton, 37-ft. span single I-beam electric crane; Roanoke Webster Brick Co., Webster, Va., 3-ton, 18-ft. span hand power crane.

Philadelphia

PHILADELPHIA, Nov. 18.—Morris, Wheeler & Co., Inc., Roberts Avenue and Pennsylvania Railroad, Philadelphia, iron and steel products, has awarded general contract to McCormick-Lenham Co., Fortieth and Chestnut Streets, for one-story storage and distributing plant, to cost about $30,000 with equipment.

Bachmann Brothers, 609 Commerce Street, Philadelphia, manufacturers of celluloid products, have plans for a new factory, to cost over $70,000 with presses and other equipment. Eugene A. Stopper, Fuller Building, is architect.

General Steel Castings Co., Eddystone, Pa., has begun work on new building, 60 x 200 ft., for general operating service, for which contract recently was let to Wark Co., 1608 Walnut Street, to cost $125,000. Simon & Simon, Fidelity Building, are architects.

Edward G. Budd Co., Twenty-fifth Street and Hunting Park Avenue, Philadelphia, manufacturer of steel automobile bodies, has awarded general contract to Wark Co., 1608 Walnut Street, for one-story manufacturing unit, to cost about $20,000 with equipment.

Board of Education, Paulsboro, N. J., is considering installation of manual training equipment in new three-story high school to cost about $300,000, for which plans are being drawn by Edwards & Green, 548 Federal Street, Camden, N. J., architects.

City Commission, City Hall, Trenton, N. J., will receive bids until Nov. 29 for pumping machinery, piping, valves, etc., for pumping plant on Clearfield Avenue. Leon D. Hirsch is city clerk.

Charles J. Schiemer, 232 North Charlotte Street, Lancaster, Pa., and associates have organized Multivane Blower & Electric Co., and will operate local plant for manufacture of heat-regulating devices and equipment, mechanical blowers, parts, etc. Chester W. Bowman, Lancaster, is also interested in new company.

Lebanon Steel Foundry Co., Lebanon, Pa., has awarded general contract to Hughes-Foulkrod Co., 1515 Race Street, Philadelphia, for two-story foundry addition, 150 x 182 ft., to cost $100,000 with equipment. Wilbur Watson & Associates, 4614 Prospect Avenue, Cleveland, are architects and engineers. W. H. Worrilow is president.

Chamber of Commerce, Coatesville, Pa., has authorized purchase of 120-acre tract on Lincoln Highway for new municipal

airport, to include hangars, repair shop and other field units, to cost more than $75,000.

Board of Education, Keystone Building. Philadelphia, is asking bids until Dec. 3 for vises, etc., as per list on file at office of Edward Merchant, secretary and business manager.

Cochrane Brass Foundry, Boll and Spahn Avenues, York, Pa., is completing construction of new one-story foundry unit, 60 x 120 ft., to cost more than $30,000 with equipment.

Allis-Chalmers Mfg. Co., Milwaukee, has appointed T. B. Wood's Sons, Co., Chambersburg, Pa., special distributer of Texrope drives. A large stock of drives and belts will be carried at Chambersburg.

South Atlantic

BALTIMORE, Nov. 18.—Baltimore Copper Smelting & Rolling Co., Canton, Baltimore, has awarded general contract to Herbert J. West, Knickerbocker Building, for a one-story addition, to cost about $35,000 with equipment.

Baltimore Airways, Inc., Edward Handler, Calvert Securities Corporation, 32 South Calvert Street, Baltimore, president, is planning construction of four hangars, with reconditioning and repair facilities, at airport on Park Heights Boulevard, to cost more than $85,000 with equipment; other field units are also proposed. Company is arranging for sale of 50,000 shares of common stock, part of fund to be used for expansion.

Baugh Chemical Co., 25 South Calvert Street, Baltimore, has plans for a one and two-story commercial fertilizer manufacturing plant, to cost about $100,000 with conveying and other equipment. W. H. Ulrich is company engineer.

Wicomico County Board of Education, Salisbury, Md., has authorized installation of manual training equipment in new three-story high school to cost about $300,000, for which bids will be asked soon on general contract by Smith & May, Calvert Building, Baltimore, architects.

Richmond Engineering Co., Richmond, Va., plans rebuilding part of metal-working shop destroyed by fire Nov. 9.

Nantahala Co., recently organized, has purchased properties of North Carolina Talc & Mining Co., Hewitts, N. C., consisting of 8000-acre tract in Nantahala Gorge district, and plans installation of works for mining of soapstone, limestone, talc and kindred products.

Old Dominion Anthracite Coal Corporation, Pulaski, Va., is considering rebuilding electric power plant at properties about 8 miles from city, recently partially destroyed by fire.

American Tobacco Co., 111 Fifth Avenue, New York, plans installation of elevating, conveying and other material-handling equipment in five new storage and distributing plant at Durham, N. C., for which general contract has been let to Fiske-Carter Construction Co., Greenville, S. C., to cost about $500,000. Company is also building similar units at Reidsville, N. C., to cost more than $250,000.

Schofield Co., 2 East Saratoga Street, Baltimore, manufacturer of silverware, metal plated goods, etc., has leased four-story plant to be erected at 3-7 East Pleasant Street, for which general contract has been let to Consolidated Engineering Co., 20 East Franklin Street, to cost about $45,000.

Norfolk Radiator Works, Inc., 160 West Olney Road, Norfolk, Va., manufacturer of automobile radiators and equipment, has awarded general contract to Nichols & Lindemann, Norfolk, for one-story plant, to cost about $30,000 with equipment. Neff & Thompson, Seaboard Bank Building, are architects. A. C. Martens is head.

Chain Belt Co., Milwaukee, has appointed following new distributers in Southeast for Rex chains and transmission equipment: Bailey - Lebby Co., Charleston, S. C.; Georgia Supply Co., Savannah, Ga., and Jacksonville, Fla.; Harry P. Leu Co., Orlando, Fla.; J. M. Tull Rubber & Supply Co., Atlanta, Ga.

High Point Machine & Mfg. Co., High Point, N. C., has been organized with capital of $100,000 to do a general machine shop and foundry business on site formerly occupied by High Point Machine Works. Company will manufacture gray iron, aluminum, bronze and boiler room castings and a few special machines, including a line of clamps for furniture factories.

Pittsburgh

PITTSBURGH, Nov. 18.—Business is slowing down somewhat and the volume of new inquiries is generally reported to be somewhat lighter. Purchases of single tools are being made from day to day, but some buyers are more cautious and a few have definitely postponed action on present inquiries until after the first of the year. Awards have not yet been announced on the Pittsburgh Board of Education's recent list, although bids closed some time ago. The United States Aluminum Co., New Kensington, Pa., has taken no action on a supplementary list of tools for which inquiries were sent out some time ago, but the Westinghouse Electric & Mfg. Co., East Pittsburgh, is closing regularly against its fourth quarter list. The Bethlehem Steel Co. has yet to place some tools for its Johnstown plant.

The effect of the recent stock market collapse on the machinery business is not yet fully apparent, but most local dealers are of the opinion that the trade will feel adverse influences over the remainder of the year. However, the year thus far has been extremely active and machinery and equipment builders in this and nearby districts have large backlogs of orders.

Westinghouse Electric & Mfg. Co., East Pittsburgh, has plans for initial unit of Eastern factory branch and distributing plant in meadow district, Newark, N. J., to be two stories, totaling 150,000 sq. ft. floor space, to cost about $500,000 with equipment. Bernard H. Prack, Martin Building, Pittsburgh, is architect.

Keystone Metal Specialties Co., recently formed by James K. Ruby, 1306 Park Avenue, McKeesport, Pa., and associates, plans operation of plant at Pittsburgh for manufacture of sheet metal products. James G. Fulton, 2850 Espy Avenue, Dormont, Pa., is interested in new organization.

Ingram-Richardson Mfg. Co., Beaver Falls, Pa., manufacturer of sheet steel and cast iron enameled products, has awarded general contract to Leroy Freed Co., 1211 Seventh Avenue, for one-story addition, 35 x 100 ft., to cost over $35,000 with equipment.

Duquesne Light Co., 435 Sixth Avenue, Pittsburgh, is planning for pumping plant and water-treating station at generating plant at Brunot Island, to cost $290,000 with machinery.

Mutual Telephone Co., 24 East Tenth Street, Erie, Pa., has closed bids on general contract for one and two-story equipment storage and distributing plant, with electrical and mechanical repair departments, and automobile service and repair shop, to cost $175,000 with equipment. Myers & Johnson, Commerce Building, are architects.

Loudon School District, Charleston, W. Va., plans installation of manual training equipment in high school at South Charleston, to cost $250,000, and junior high school at Marmet, W. Va., to cost $100,000. Bond election has been called on Dec. 10, and architect will be selected immediately thereafter.

Aviation Committee, Chamber of Commerce, Clarksburg, W. Va., is considering purchase of 40-acre tract on Buckhannon Road for city airport, to include hangars, repair shop and other structures, to cost more than $75,000 with equipment. J. M. Carskadon is chairman of committee.

William B. Scaife & Sons Co., range boiler and steel tank manufacturers, Pittsburgh, has recently completed a large warehouse for storing galvanized products.

Detroit

DETROIT, Nov. 18.—American Forging & Socket Co., Branch Street, Pontiac, is considering new plant comprising several one-story units, to cost about $150,000 with equipment.

American Oil & Grease Corporation, Jackson, is planning to rebuild part of plant recently destroyed by fire, with loss more than $100,000 including equipment.

Checker Cab Mfg. Co., Gibbons Street, Kalamazoo, manufacturer of taxicabs, will soon begin superstructure for one and two-story addition, primarily for automobile body manufacture, to cost more than $350,000 with equipment.

Copeland Products, Inc., 630 Lycaste Street, Detroit, manufacturer of electric refrigerating equipment, is arranging for early removal of plant to new buildings at Mount Clemens, Mich., where production will be concentrated and capacity increased.

Consumers Power Co., Jackson, will erect two-story addition to steam-operated electric generating plant at Kalamazoo, to cost over $150,000 with equipment. Stevens & Wood, Inc., 20 Pine Street, New York, is consulting engineer.

Clarke Sanding Machine Co., 3815 Cortland Street, Chicago, manufacturer of vacuum portable sanding machines and parts, has awarded general contract to Strom Construction Co., Muskegon, Mich., for one-story plant at last-noted place, totaling about 38,000 sq. ft. floor space; to cost more than $75,000 with equipment. Company will remove present plant to Muskegon, where production will be increased and concentrated. L. G. Hallberg, 116 South Michigan Avenue, Chicago, is architect.

Wood Hydraulic Hoist & Body Co., 7924 Riopelle Avenue, Detroit, has awarded general contract to Otto Randolph, Inc., 59 West Jackson Boulevard, Chicago, for one-story addition, 80 x 190 ft., to cost about $70,000 with equipment.

Lakey Foundry & Machine Co., Muskegon, is said to be arranging for rebuilding part of plant recently destroyed by fire.

O. L. Anderson Co., Inc., 1347 East Fort Street, Detroit, manufacturer of metal stampings, automobile gasoline tanks, etc., is contemplating one-story plant unit on site recently acquired, to cost about $70,000 with equipment.

Board of Education, Ypsilanti, plans installation of manual training equipment in new junior high school to cost $750,000, for which general contract has been let to R. S. Knapp Co., 15518 Idaho Street, Detroit. R. S. Gerganoff, Ypsilanti, is architect.

Briggs Commercial & Development Co., Buhl Building, Detroit, has plans for a new multi-story automobile service, repair and garage building at Pontiac, to cost more than $100,000 with equipment. A similar structure is planned at Detroit to cost close to like sum. Charles Kotting, Dime Bank Building, Detroit, is architect for both structures. Company also has plans for another such automobile building at Detroit, to cost more than $125,000 with equipment. O'Dell & Diehl, Donovan Building, Detroit, are architects for last-noted unit.

Chicago

CHICAGO, Nov. 18.—Activity in the local machine tool market has subsided somewhat from the rate of a week ago, the change being more noticeable in inquiries than in orders. Railroads are still taking figures for budget use, and several lines have intimated that 1930 purchases of machine tools will be heavy. A local steel mill after paring down its list has placed a 24-in. shaper and an 18-in. x 12-ft. and a 30-in. x 14-ft. lathe, and will buy five or six additional items. A local embossing press manufacturer has ordered a 48-in. planer.

Several farm implement makers have placed orders for machine tools. A Chicago jobbing shop plans to replace nine machine tools and the Great Northern Railroad will take prices on 15 tools, the majority of which are woodworking. Additional inquiries are expected from farm machinery manufacturers in Illinois, Iowa and Michigan. Shops, with the exception of those operated by radio manufacturers, remain busy. Nash Motors Co., after curtailing output last week, is now increasing production.

Belden Mfg. Co., 4625 Van Buren Street, Chicago, manufacturer of insulated wire and cable, has filed plans for a two-story building, 68 x 132 ft., to cost $60,000. A. S. Coffin, 6 North Michigan Avenue, is architect.

Allis-Chalmers Mfg. Co., West Allis, Wis., tractor division, has plans for one-story addition to plant at Springfield, Ill., to cost about $135,000 with equipmen.

Grigsby-Grunow Co., 2038 North Kolmar Avenue, Chicago, manufacturer of radio equipment and parts, has awarded general contract to H. Ericcson Co., 674 North La Salle Street, for three-story addition, 260 x 300 ft., to cost about $750,000 with equipment. Graham, Anderson, Probst & White, 80 East Jackson Boulevard, are architects. Company has also let contract to same company for two-story addition, 80 x 680 ft., to plant on Dickens Avenue, recently acquired, to cost more than $500,000 with equipment, for which plans were drawn by Holabird & Root, 333 North Michigan Avenue, architects.

Metz Mfg. Co., Seventeenth and Elm Streets, Dubuque, Iowa, manufacturer of sash, doors, etc., has awarded general contract to R. F. Conlon, Federal Bank Building, for three-story and basement addition, 80 x 130 ft., to cost about $60,000. C. I. Krajewski, 730 Main Street, is architect.

Colorado Fuel & Iron Co., Pueblo, has authorized electrification of mining properties at Crested Butte, Colo., including installation of additional equipment, to cost $175,000.

City Council, Watertown, S. D., is considering installation of a municipal electric light and power plant, to cost close to $100,000 with equipment.

Hume Pipe Corporation, Room 910, 100 West Monroe Street, Chicago, manufacturer of steel reinforced concrete pipe, is considering new plant at Arlington Heights, Ill., with main unit one-story, 75 x 165 ft., to cost about $115,000 with equipment. J. A. Dunn, Evanston, Ill., is vice-president and general manager.

Great Northern Railway Co., Railroad Building, St. Paul, Minn., has awarded general contract to Pappin & Dudley, Great Falls, Mont., for additions to local shops, including one-story car repair shop and mill, 115 x 600 ft., to cost about $50,000, and one-story wheel shop, 50 x 70 ft., to cost about $25,000 with equipment. T. D. McMahon is company architect, address noted.

Atchison, Topeka & Santa Fe Railroad Co., Topeka, Kans., has awarded a general contract to W. A. Smith Co., Fort Madison, Iowa, for extensions in engine house and repair shops at Shopton, Iowa, to cost $60,000 with equipment.

Public Service Co. of Colorado, Denver, is arranging an expansion program for 1930 to cost over $2,500,000. Work will include extensions in steam-operated electric power plants at Sterling, Grand Junction, Alamosa and other localities, to cost $700,000 with equipment, and an addition to the Valmont generating station near Boulder, to cost about $500,000 with machinery.

Sundstrand Engineering Co. has acquired a one-story factory at Harrison Avenue and Ninth Street, Rockford, Ill., with 10,000 sq. ft. floor space and will center all activities there. Company is planning expansion of its oil burner production.

Buffalo

BUFFALO, Nov. 18.—Union Carbide & Chemical Corporation, Niagara Falls, N. Y., plans expansion at local works for increase in production of carbide. Manufacture of ferroalloys will be transferred to plant of subsidiary at Glen Ferris, W. Va., where increased facilities will be arranged. Company will also carry out hydroelectric power development in last-noted State. Work will form part of a general development program to cost over $25,000,000. Headquarters are at 30 East Forty-second Street, New York.

Vanott Machine Corporation, Buffalo, recently organized by Thomas J. Mingovan, 174 Whitfield Avenue, and associates, with capital of $75,000, plans operation of local factory to manufacture machinery and parts. Vincent Schiavi, 559 McKinley Parkway, is also interested in new company.

Penn Yan Boat Co., Liberty Street, Penn Yan, N. Y., has plans by L. A. Harding Construction Corporation, 1335 Main Street, Buffalo, for addition to boat-building and repair plant, to cost about $135,000 with equipment. It is understood that construction company noted will receive general contract.

Union Free High School District No. 1, East Aurora, N. Y., is considering installation of manual training equipment in addition to high school, to cost $325,000, for which plans will be drawn by A. H. Merritt, Erie County Bank Building, Buffalo, architect.

Cleveland

CLEVELAND, Nov. 18.—Considering the unsettled situation that has resulted from the collapse of stock market prices, machine tool business held up quite well the past week. A fair volume of sales in single machines was well distributed among metal-working industries. Deliveries of some tools have been deferred, but there have been practically no cancellations. The Thew Shovel Co., Lorain, Ohio, has an inquiry out for a number of machines, and the Industrial Brownhoist Corporation, Cleveland, is considering the purchase of a few tools.

Some business is coming from the Akron district where tire mold manufacturers are preparing for 1930 production. One purchase in this field was a boring mill by a Cuyahoga Falls plant. Buying by the automotive industry in the Michigan territory is almost at a standstill. Deliveries on some lines show a gain of two weeks, but others have not improved.

Brainard Steel Co., Warren, Ohio, contemplates enlargement of its plant, quadrupling present capacity. Plans call for construction of two factory buildings and an office building, to cost about $300,000.

Cleveland office of William K. Stamets has been moved to larger quarters at 462-464 Rockefeller Building. George D. Miller is Cleveland district manager. Mr. Stamets has been appointed sales representative in northern Ohio for Andrew C. Campbell, Inc., manufacturer of Campbell nibblers.

Truscon Steel Co., Youngstown, Ohio, manufacturer of standard steel buildings, steel sash, etc., is arranging for expansion at local mill, including new buildings and equipment, to cost about $500,000. Julius Kahn is president.

W. R. Hopkins, City Hall, Cleveland, city manager, has awarded general contract to Gilchrist Construction Co., Western Reserve Building, for one-story municipal automobile service, repair and garage building, 80 x 180 ft., to cost $100,000 with equipment.

B. F. Goodrich Rubber Co., Akron, Ohio, will carry out expansion at branch mill at Los Angeles, including new buildings and equipment, to cost about $250,000.

Electric Power & Maintenance Co., Monroe and Eleventh Streets, Toledo, Ohio, has plans for one and two-story automobile repair, service and electrical shop, to cost about $50,000 with equipment. Langdon, Hohly & Gramm, Security Bank Building, are architects.

Union Malleable Mfg. Co., Ashland, Ohio, manufacturer of pipe, pipe fittings, etc., has purchased for expansion local mill of Ashland Tire & Rubber Co., consisting of group of buildings on 4-acre tract.

Timms Spring Co., Buckeye Street, Elyria, Ohio, manufacturer of wire

springs and other wire specialties, is considering rebuilding part of plant destroyed by fire Nov. 9.

Duncan Oil Refining Co., Youngstown, plans rebuilding part of refinery destroyed by fire Nov. 9.

Columbia Metal Stamping & Die Co., Cleveland, manufacturer of parts for automobiles, radios and electrical appliances, has purchased a plant now being constructed at East 116th Street and Harvard Avenue from Harold K. Ferguson, president of H. K. Ferguson Co., Cleveland. About $50,000 will be expended in new equipment for plant, which will add 21,000 sq. ft. to floor space of company. Fred C. Koch is president.

St. Louis

ST. LOUIS, Nov. 18.—Railroads centering in St. Louis are expected to come into the market shortly after the first of the year for their 1930 machine-tool requirements. From contacts with purchasing agents, manufacturers' representatives get the impression that the lists will be larger than in 1929, but that there will be few, if any, heavy tools purchased. Missouri Pacific is in the market for a heavy-duty tire turning lathe.

Missouri Boiler & Sheet Iron Works, 908 South Twenty-third Street, St. Louis, has arranged for purchase of adjoining property for expansion, particularly in tanks and kindred plate products.

Wood Brothers, Inc., Kansas City, Mo., manufacturer of aircraft and parts, will soon take bids on general contract for one-story plant at Rosecrans Field, St. Joseph, Mo., for parts manufacture and assembling, to cost over $300,000 with equipment. C. A. Smith, Finance Building, Kansas City, is architect.

Clay & Bailey Mfg. Co., Kansas City, Mo., manufacturer of tank and drum fittings and other iron and steel products, operating Morgan Foundry Co., Kansas City, has engaged Stephen C. Kenney, Gumbel Building, architect, to prepare plans for plant on 3½-acre tract recently acquired. Initial units will be one-story, about 60 x 120 ft., and will be used for foundry, machine shop, storage and other units, entire project to cost more than $90,000 with equipment.

Grand Hydro-Electric Corporation, Tulsa, Okla., recently organized by Philip Ball, Security Building, St. Louis; W. E. Hudson, Tulsa, and associates, has plans for hydro-electric generating plant on Grand River, Mayes County, taking over power site and property heretofore held by W. E. Hudson, now affiliated with new company. Plant will have ultimate output of 400,000 hp., with initial station approximating one-fourth of this sum, to cost more than $500,000 with transmission system.

City Council, Lincoln, Neb., will soon take bids for equipment for municipal electric light and power plant, including boilers, stokers, economizers, superheaters, etc., to cost about $50,000. D. L. Erickson is engineer. Theodore H. Berg is city clerk.

Southern Air Service, Inc., Tulsa, Okla., has leased three-story building at 205 South Cheyenne Avenue, and will establish branch for Nicholas-Beasley Corporation, Marshall, Mo., manufacturer of airplanes and parts, including service, repair and parts building. A flying school is planned. Entire project will cost more than $70,000.

City Council, Concordia, Mo., has plans for municipal electric light and power plant, to cost about $50,000 with equipment. W. B. Rollins & Co., Railway Exchange Building, Kansas City, Mo., are engineers.

Carter Carburetor Co., 2838 North Spring Ave., St. Louis, is erecting a third-floor factory addition containing about 13,000 sq. ft. floor space, which will increase present production 50 per cent.

Star Mfg. Co., Inc., St. Louis, manufacturer of popcorn machines and electric grills, has moved from 4477 Finney Avenue to 4569 Swan Avenue, increasing its floor space from 4000 to 12,000 sq. ft.

Cincinnati

CINCINNATI, Nov. 18.—Inquiry for machine tools continues fairly brisk, but buyers seem to be displaying more caution in placing orders after receiving quotations. One leading interest indicates that fresh bookings last week were unusually light. Despite this slackening in demand prospects are good, with inquiry remaining level. There is a noticeable increase in requests from Canada and the Pacific Coast for quotations. Production is being maintained at a high level and manufacturers expect that present schedules will be maintained well into next year.

Procter & Gamble Co., Gwynne Building, Cincinnati, has approved plans for new plant at Memphis, Tenn., to be operated by Buckeye Cotton Oil Co., a subsidiary, to cost about $1,000,000 with machinery.

William Powell Co., 2521-25 Spring Grove Avenue, Cincinnati, manufacturer of valves, engineering specialties, etc., will soon take bids on general contract for two-story addition, to cost about $55,000 with equipment. Teitig & Lee, Merchants' Building, are architects. H. E. Coombe is vice-president and general manager.

Traveling ovens, power equipment, conveying and other machinery equipment will be installed in new plant, 150 x 200 ft., to be erected by Colonial Baking Co., Memphis, Tenn., to cost $320,000. Majority of equipment will be electrically operated.

Holophane Glass Co., Newark, Ohio, has plans for an addition, to include tank house, installation of two furnace units, and auxiliary equipment, to cost about $80,000 with machinery.

Auto Rotary Lift Co., 1055 Kentucky Street, Memphis, Tenn., has awarded general contract to John F. Schwitzer, 591 North Third Street, for one-story plant, 50 x 150 ft., to cost about $22,000 with equipment.

Memphis Natural Gas Co., Memphis, Tenn., is considering construction of pipe line from Memphis to Covington, Brownsville, Dyersburg and vicinity, to cost more than $100,000 with booster stations.

Edward R. Edwards and associates have formed Edwards Engineering Co., Niles, Ohio, to manufacture a special steel loading and unloading device, the invention of Mr. Edwards. One of these machines has been in successful operation for five months at plant of Mahoning Valley Steel Co. at Niles.

Gulf States

BIRMINGHAM, Nov. 18.—National Portland Cement Co., Santa Fe Building, Dallas, Tex., has purchased river front property at Vicksburg, Miss., including quarry lands, as site for new cement mill with daily capacity of 3500 bbl. Project will include steam power house, machine shop and other units, and will cost over $1,000,000 with machinery. Equipment will be purchased early next year.

White Packing Co., Parallel Street, Montgomery, Ala., meat packer, has plans for new two-story unit, with refrigerating department, lard refinery and other units, to cost about $200,000 with equipment. H. Peter Henschien, 1637 Prairie Avenue, Chicago, is architect and engineer.

Gulf Pipe Line Co., Fort Worth, Tex., a subsidiary of Gulf Oil Corporation, Fort Worth, with headquarters in Frick Annex, Pittsburgh, has taken title to property near Lucas, Tex., and plans construction of oil storage and distributing plant, to cost $125,000 with equipment, including pipe line facilities.

Taylor Link Oil Co., San Angelo Bank National Bank Building, San Angelo, Tex., is considering construction of carbon black manufacturing plant near Girvin, Tex., to cost over $75,000 with equipment.

Board of Education, Lubbock, Tex., is considering installation of manual training equipment in new two and three-story high school to cost $650,000, for which bids will be asked at once on general contract by Peters, Strange & Bradshaw, Myrick Building, architects.

Landreth Petroleum Co., McCamey, Tex., has begun construction of oil storage and distributing plant in Upton County, to cost more than $150,000 with tanks, pumping machinery, etc. A similar plant is planned in Pecos County.

Alford Pure Milk & Ice Co., 819 South Presa Street, San Antonio, Tex., has plans for immediate construction of one-story ice-manufacturing plant at Mercedes, Tex., to cost about $70,000 with machinery.

International Harvester Co., 606 South Michigan Avenue, Chicago, has plans for one and two-story factory branch and distributing plant at Sweetwater, Tex., 100 x 100 ft., and 100 x 500 ft., with part given over to assembling department, to cost over $100,000 with equipment. W. D. Price is company architect.

Merchants Ice & Cold Storage Co., 1306 East Houston Street, San Antonio, Tex., has plans for addition to cold storage and refrigerating plant, to cost about $125,000 with machinery. W. E. Simpson Co., Milam Building, is engineer.

Maverick County Water Improvement District No. 1, Eagle Pass, Tex., has plans for a hydroelectric power plant on Rio Grande River, in connection with irrigation system, for which permission has been asked from State Board of Water Engineers. Generating station will include transmission system, and will cost $1,000,000.

Ford Motor Co., Detroit, is planning an addition to branch assembling plant at Houston, Tex., to cost about $50,000 with equipment.

Oklahoma Natural Gas Co., 112 North Broadway, Oklahoma City, Okla., plans one-story mechanical repair and equipment shop at San Angelo, Tex., to cost about $40,000.

Milwaukee

MILWAUKEE, Nov. 18.—Inquiry continues in good volume, although there has been some recession in orders for machine tools, but not enough to lower business below last year's mark at this season. Deliveries have improved but slightly. Orders cover a wide range of industries but are mostly for small lots. Cancellations have not exceeded the normal number and none is attributed to the situation in the securities market. Several large lists are being awaited from manufacturers of excavating equipment, cranes, marine motors and gasoline engines. Automobile production is picking up slightly. Some manufacturers of agricultural implements, with more orders than at this time last year, announce plans for expansion of production facilities.

Curtiss Airport Corporation, 27 West Fifty-seventh Street, New York, has awarded contract to Hunzinger Construction Co., 144 East Wells Street, Milwaukee, for service building and hangar, 122 x 145 ft., at newly acquired airport at Granville, Wis.

Spring City Foundry Co., 901 West St. Paul Avenue, Waukesha, Wis., is building a shop addition, 55 x 65 ft.

Kimberly-Clark Co., Neenah, Wis., is taking bids for addition to finishing room, 122 x 127 ft., and paper storage and crate shop, 148 x 276 ft., to cost over $150,000. O'Keefe-Orbison Engineering & Construction Co., 201 East College Avenue, Appleton, Wis., is engineer.

Western Printing & Lithographing Co., Racine, Wis., has appointed Austin Co., Cleveland, to design an addition to plant at 1212 Mound Avenue, to cost $100,000. R. A. Spencer, vice-president, is in charge.

West Side Mfg. Co., 3100 Walnut Street, Milwaukee, millwork manufacturer, has appointed Klug & Smith, Mack Block, engineers, to design three-story addition, 114 x 138 ft., to cost about $100,000 including equipment. Edward Schildknecht, president-treasurer, is in charge.

Board of Industrial Education, West Allis, Wis., has let contract to Pfeifer Construction Co., West Allis, for third unit of Vocational Training School, to be three stories, 40 x 57 ft.

Indiana

INDIANAPOLIS, Nov. 18.—Bids will be received until Dec. 10 by Board of Trustees, Indiana Soldiers and Sailors Orphans' Home, Knightstown, Ind., for power plant to cost over $125,000 with equipment. McGuire & Shook, 941 North Meridian Street, Indianapolis, are architects.

Board of Trustees, Notre Dame University, South Bend, is considering a new multi-story mechanical engineering building on campus, to cost more than $400,000 with equipment.

Great Atlantic & Pacific Tea Co., 209 West South Street, Indianapolis, with headquarters at 420 Lexington Avenue, New York, has leased three-story building, 105 x 400 ft., now in course of construction on South State Avenue, for baking plant and factory branch for storage and distribution, installation to include ovens, power machinery, conveying, loading and other equipment. It will cost about $260,000, and is scheduled for occupancy in January.

Board of Trustees, Milwaukee School of Engineering, Milwaukee, is considering establishment of branch school at Indianapolis, with facilities for instruction in electrical and mechanical engineering.

Pacific Coast

SAN FRANCISCO, Nov. 14.—Plans are being considered by Minerals Increment Co., Los Angeles, care of J. Ralph McInerny, 1400 East Sixth Street, president, for new plant at Pittsburg, Cal., where 6-acre tract has been secured, for production of new light metal for aircraft construction, for which rights to German patents have been secured. Initial plant will cost about $200,000 with equipment.

Aeronautical Corporation, San Diego, Cal., T. Claude Ryan, president, has applied for permission to lease part of tidelands as site for plant to manufacture airplanes, including parts, and assembling departments. Initial units will cost about $120,000 with equipment.

Western Sugar Refining Co., 2 Pine Street, San Francisco, has awarded general contract to Barrett & Hilp, 918 Harrison Street, for one and two-story addition, 140 x 320 ft., for storage and distributing plant, to cost about $250,000 with mechanical-handling and other equipment. H. J. Brunnier, Sharon Building, is architect.

City Council, Seattle, is considering construction of municipal cold storage and refrigerating plant at Smiths Cove, consisting of four two-story units, 90 x 420 ft., to cost about $400,000 with equipment. City engineering department will be in charge.

Clift Motor Co., 1104 Central Avenue, Bellingham, Wash., is planning two-story machine, welding and pattern shop, 50 x 110 ft., to cost about $22,000 with equipment.

DeMartini Motor Truck Co., 435 Pacific Street, San Francisco, is considering early rebuilding of part of plant recently destroyed by fire.

Pacific Iron & Steel Co., 241 East Avenue 26, Los Angeles, operating a general fabricating works, has purchased 22-acre tract at Compton, as site for new plant, to cost about $250,000 with equipment. It is understood that present works will be removed to new location. Company engineering department is in charge.

Empire Refining Co., Signal Hill oil district, near Long Beach, Cal., is considering rebuilding part of refinery recently destroyed by fire.

Rickard Anti-Friction Brake, Inc., 1202 East Artesia Street, Bellflower, Cal., has been organized with capitalization of $100,000 to manufacture brakes for automobiles, trucks, elevators, oil wells, hoists and other appliances. Actual manufacture will be done by subsidiary companies which are in process of organization and which will need materials and equipment. Parent company will confine itself exclusively to designing models and perfecting patent. A. D. Boone is secretary.

Canada

TORONTO, Nov. 18.—Although no lists for machine tools have been issued recently, demand for single tools is fairly steady. Business as a whole is better than a year ago and prospects indicate that trade for the remainder of the year will be in fairly good volume. Industrial plant construction is holding at a good level with a number of large companies either erecting plants or additions or having plans prepared for early erection. Many machine tool builders have a good volume of unfilled business.

Houdaille Engineering Corporation, 537 Delaware Avenue, Buffalo, N. Y., is considering establishment of a plant at Bridgeburg, Ont., on which construction will start next spring. Harold Lighthart, Fort Erie, Ont., is interested.

Nichols Copper Co., 25 Broad Street, New York, is planning erection of a copper refinery near Montreal.

United Mfg. Co., has awarded general contract to Charles Page Construction Co., Three Rivers, Que., for erection of a plant at Cap de la Madeleine, Que., to cost $60,000.

St. Mary's Cement Co., St. Mary's, Ont., has started work on a plant addition.

Regina Sash & Door Co., 3300 Railway Street, Regina, Sask., has awarded contract to Shoquist Brothers, 211 Duchess Street, Saskatoon, for a one-story factory, 100 x 490 ft., at Saskatoon, to cost $150,000.

Foreign

NEGOTIATIONS have been concluded by Yale & Towne Mfg. Co., Stamford, Conn., manufacturer of locks, builders' hardware, chain hoists, etc., for purchase of H. & T. Vaughan, Ltd., Willenhall, England, manufacturer of similar products, with factory branch and distributing plant at London. Purchasing company will consolidate with organization, operating as subsidiary unit. Present plants will be continued and expansion in output is planned.

Compagnie Industrielle des Petroles, Paris, France, a subsidiary of Vacuum Oil Co., 61 Broadway, New York, is consiiding new oil refinery in France, to cost more than $600,000 with equipment.

Ford Motor Co., Detroit, is reported to have concluded arrangements for purchase of site at Gdyniawith, Poland, for new assembling plant to cost more than $650,000 with equipment.

Société Francaise Recherches au Venezuela, Paris, France, known as "Recherches," is completing plans for extensive oil operations in Venezuela. Three producing wells will be established in Mene Grande, Mara and Urdaneta districts, near Lake Maracaibo, and storage and distributing facilities constructed. Plans have been drawn for a pipe line from plants to Lake Maracaibo for loading on tankers. Company has recently increased capital to 60,000,000 francs (about $2,200,000), part of proceeds to be used for project. Société de Prospection de Petrole et de Mineraux par les Procedes Geophysiques, Paris, known as "P. P. G." is also interested in enterprise and will be affiliated in pipe line construction.

Firestone Tire & Rubber Co., Akron, Ohio, is planning expansion at mill at Brentford, near London, England. Harvey S. Firestone, Jr., vice-president, and E. A. Hoener, chief engineer, have left for that place and will arrange details.

A new company has been organized at Manila, P. I., by local interests to construct and operate a mill for the manufacture of mechanical rubber goods, using native-grown rubber as raw material. Equipment purchases will be made at once in United States. Information at office of Bureau of Foreign and Domestic Commerce, Washington, reference Philippines No. 96090.

New Trade Publications

Milling Machines in Aircraft Work.—Kearney & Trecker Corporation, Milwaukee. Booklet of 24 pages under title of "Milling Faster for an Industry That Flies," illustrates several applications of the company's machines on airplane engine parts.

Speed Reducers.—Ohio Gear Co., 1333 East 179th Street, Cleveland. Catalog No. 29-A, giving horsepower ratings and dimensions of small worm-gear speed reducers. Timken roller bearings are used, and the hardened worms are ground all over, including the thread. Cases are of semi-steel, with ample reservoir for oil.

Lathe and Drill Chucks.—Westcott Chuck Co., Oneida, N. Y. Leaflet of four pages.

Centrifugal Compressors and Blowers.—De Laval Steam Turbine Co., Trenton, N. J. Catalog F, 48 pages, includes turbine-driven blast furnace blowers rated at 60,000 cu. ft. per min., against 30 lb. maximum pressure at 2800 r.p.m. Both single stage and multistage blowers and boosters for use in water gas plants and in connection with coal gas retorts and coke ovens are shown, as well as large multistage compressors for the high pressure called for in the gas industry. Other applications include converters, cupolas, pneumatic handling of materials and supercharging Diesel engines. The catalog includes data relating to the mechanics and thermodynamics of the compression of gases and the physical properties of industrial gases.

Electric Heat in Industry.—General Electric Co., Schenectady, N. Y. Bulletin 261-A of 48 pages illustrates and describes the application of electric heat to groups of basic operations commonly found in industrial plants. About a dozen pages are devoted to the metal industry and many other industries are covered. The industrial advantages of electric heat are stressed in the introduction.

Chain Grate Stoker.—Combustion Engineering Corporation, New York. Catalog of 27 pages illustrating and describing the Green natural-draft chain grate stoker. It is installed under boilers totaling over 1,200,000 rated hp. and can burn screenings from noncoking or moderately coking bituminous coals, high-ash coals and many lignites.

Bearing Metals.—Phosphor-Bronze Smelting Co., Philadelphia. Card 9 x 11 in., with table of sizes and approximate weights of Elephant brand phosphor bronze "S" metal bushings carried in stock. Cored bushings are in 49 sizes, from 1 to 10 in. outside diameter, the 1 to 4-in. sizes being in steps of ⅛ in. and the 4 to 10-in. sizes in steps of ¼ in. Outside diameter and sizes of cores are in black and the approximate weights of 12-in. lengths are in red; wall thickness is indicated at the bottom of each column. Weights of solid metal, stocked in 25 sizes, from 1 to 4 in. diameter, are shown at the extreme right of the chart, the arrangement of which is such that the data for each size of bushing may be read at a glance.

Industrial Lubrication.—Alemite Corporation, 2650 North Crawford Avenue, Chicago. Bulletin of eight pages, illustrating and describing the Alemite lubricating system, designed for reducing production costs.

The Week's News Quickly Told

Current Events That Bear on the Course of Business

FREEDOM of the seas for food ships is proposed by President Hoover, but Europeans believe this would prevent an economic blockade of a belligerent nation, regarded the most effective weapon of the League of Nations. The President would prevent war by prompt adjustment of differences and increasing the sense of national security, rather than by enforcing peace . . . Guatemala and Honduras accept invitation to meet in Washington and discuss their boundary dispute.

* * * * *

MACDONALD is assured of whole-hearted support by all parties in the House of Commons for his plans for the naval conference, Work on Singapore naval base, being developed for battleships, is suspended . . . Release of funds from stock exchange eases interest rates in foreign as well as American financial centers to the benefit of trade. Further stimulation of employment in Great Britain is to come from an extensive program of utility improvements, highway construction and railway electrification . . . Canada will buy 600,000 tons of British hard coal this winter.

* * * * *

INDUSTRIES and regions connected with automobile and residential construction reflect the weakness in those lines. Thus, trade in the States bordering on the Great Lakes and the lumbering industry is depressed . . . Retail trade in other parts of the country is affected by continued mild weather . . . Other basic industries continue at a high level, with no marked reductions, other than seasonal.

* * * * *

FACTORY employment, wages and farm income remain at high figures; car loadings and retail sales also reflect a large volume of distribution in general trade, in the opinion of the Federal Reserve Board.

* * * * *

STOCK, grain and cotton exchanges declined severely but later recoverd all or nearly all of their losses . . . Commodities generally continue a slow but steady decline in price—good for consumers, but not so good for the producers.

* * * * *

TAX reduction (1 per cent on normal incomes of individuals and corporations) is promised by President Hoover, Secretary Mellon, and party leaders in Congress.

* * * * *

TEXTILE and cotton yarn production will be curtailed sharply by agreement among Southern mills, in order to match production to orders. About two weeks' supply is now on inventory . . . New England cotton industry is operating at about 80 per cent of one shift.

* * * * *

EXPORTS and imports during October were at highest totals for several months. Manufactured goods comprised half the exports; chemicals and machinery were prominent factors. Auto-trucks, exported to South America, constituted a bright spot in the automotive industry . . . Europe has taken considerably less copper this year than expectations.

* * * * *

BANK for International Settlements will be located in Basle, Switzerland. Its limited powers will not compete with various central banks, and it assumes no responsibility for settling the reparations question . . . Belgian representatives protested its location . . . Ambassador Schurman is negotiating a plan for direct payments, Germany to the United States, independent of the Young plan.

* * * * *

SOVIET budget, equivalent to $5,700,000,000, is nearly half again as large as last year, large increases being assigned to education, agriculture and electrification. Financing state industries will require 13 per cent of the total, but about one fifth this sum is expected to return to the treasury as profits . . . . Efforts to establish collective and mechanized farms for intensive grain production have met much resistance from well-to-do farmers, and numbers of them have been executed or exiled . . . Eighty per cent of the grain crop has been taken by the State at a fixed price . . . House of Commons has approved resumption of diplomatic relations between England and Russia . . . MacDonald Engineering Co., Chicago, received a $110,000,000 contract to build cement plants, grain elevators and flour mills in Russia . . . United States Shipping Board has sold 25 cargo vessels, laid up seven years, to the Soviet Union.

* * * * *

RAILROAD construction valued at $200,000,000, comprising passenger stations, freight terminals and yards, is being undertaken in Philadelphia by the Pennsylvania and Baltimore & Ohio railroads . . . The New York Central Railroad proposes to increase its capital stock from $500,000,000 to $700,000,000 — its valuation is now over one billion. It has also asked the Interstate Commerce Commission to authorize a new main line skirting Syracuse, New York, where its present tracks occupy a down-town street . . . Transcontinental lines oppose Wyoming-Montana Railroad's plan to build and link up a system in the Rock Mountain States extending from Canada to Mexico . . . American Locomotive Co. has bought McIntosh & Seymour Corporation of Auburn, N. Y., manufacturer of the Diesel engines used for oil-electric locomotives.

* * * * *

TELEPHONE rates in New York will be increased $3 to $5 per year, according to award of Statutory Court in a 9-year old rate case. Company has a right to a 7-per cent return on reproduction value of plant, less depreciation.

Wear Tests on Bearing Bronzes

Pioneer Work on Difficult Subject Undertaken to Discover Best Alloy and Casting Method for Journal Boxes Carrying High Unit Loads

BY W. M. CORSE*

IN all bearings worthy of the name the loss in weight, after they are run-in, is practically zero as long as lubrication is maintained. Consequently test methods were devised which indicated comparative resistance of copper-lead-tin alloys to combined rolling and sliding friction when run dry, and resistance to repeated pounding. Whether a chill cast bearing is better than a sand cast one is still an open question; either method appears to give suitable results when the analysis contains 5 to 7 per cent tin and 15 to 22 per cent lead.

ABOUT ten years ago railway executives and metal manufacturers became acutely aware of the fact that the wide variations in the specifications for bearing metals were inimical to the interests of both groups. To be sure, some progress had been made by technical societies toward specifications for bearing metals, but due to lack of definite reproducible data (or for other reasons) individual consumers refused to accept the recommendations.

The Chicago Bearing Metal Co. had developed certain definite ideas concerning the manufacture and practical applications of bearing bronzes, but there was neither support nor disproval of these views in the literature of the subject. There was, in fact, little but theories and personal opinions. Also, material found to be satisfactory by one group of users seemed to fail in the hands of another.

In January, 1925, a trunk line railroad considered the advisability of replacing sand cast bearings with others cast in metal molds, in the belief that the latter were superior. But investigation showed little evidence on which to base predictions that the change would be beneficial. Lack of this information influenced the Chicago Bearing Metal Co. to undertake the investigation herein summarized, and late in 1925 the work was begun at the Bureau of Standards, under the research associate plan. E. R. Darby, chief metallurgist of the company, was very active not only in getting the work started but in supervision of the project as well.

The Chicago Bearing Metal Co. supported the work until 1927, when its interests were merged with those of the Magnus Co., and after that date R. J. Shoemaker, engineer of tests of the Magnus Co., lent his cooperation. The writer of this article acted as consulting metallurgist throughout the period. The final phases of the program were completed by the staff of the Bureau of Standards and the results published in Research Paper No. 13,, entitled "Wear and Mechanical Properties of Railroad Bearing Bronzes at Different Temperatures," by H. J. French, senior metallurgist, S. J. Rosenberg, assistant metallurgist, W. LeC. Harbaugh, research associate, and H. C. Cross, junior metallurgist. The material presented herewith is developed at much greater length in the research paper noted.

There are at present no generally accepted methods of test nor any well defined procedure which may be followed in attempting to compare different bearing metals. Reliable information is based on practical experience, and performance in service is the logical criterion. For various reasons it is difficult to approximate service conditions in laboratory tests, but the latter can be more closely controlled and can, therefore, give fundamental information of value. It was recognized, also, that supplementary service tests would be of great value, but for fair comparisons the conditions of service must be resolved into essential components which can be expressed in terms of fundamental properties.

The major object of the tests was to find out the important physical properties of a group of copper-tin-lead alloys within (and in some cases beyond) the limits of chemical composition and constitution ordinarily applied industrially in railroad journal boxes, and to supply information that might ultimately permit a logical revision of specifications.

Alloys Selected

Two groups of copper tin alloys were studied, i.e. alloys with copper-tin ratio of 92.5 to 7.5 and lead varying from 0.25 to 25 per cent, and a second group with copper-lead

*Metallurgical engineer, Washington.

ratio of 84 to 16 and tin varying from a trace to 10 per cent.

Each alloy was cast in sand molds and in metal molds and the mechanical and wearing properties studied at different temperatures.

Alloys were cast into "sticks" about 12 in. long by 2½ in. diameter, and both chill cast and sand cast sticks were cast on end and gated at the bottom. This method was unsatisfactory, as the sticks thus prepared were filled with tiny pockets.

Next was tried the method of melting, freezing and re-melting under glass. This gave satisfactory results for laboratory tests but was too slow for commercial purposes.

The equipment employed in the metallographic examinations, hardness, tensile and notched bar impact tests was typical of that used on this continent and abroad. Special equipment was constructed for repeated pounding tests and is shown in the figure. An Amsler wear-testing machine was also used in the wear tests. The important features of both of these special test units are summarized in the captions.

Wear Under Sliding and Rolling Friction

Two sets of tests were first carried on in the presence of oil on a group of copper-tin alloys containing different proportions of lead. In the first set the specimens were subjected to sliding friction under contact pressures within the range normally encountered in railroad bearing service. In the second set the alloys were subjected to combined rolling and sliding friction under relatively high contact pressures.

Disks made of railroad axle steel were rotated against the specimens for a selected number of revolutions, and the wear determined by loss of weight. Repeated and consecutive determinations were made with the same pair of specimens (bronze and steel) until a uniform rate was attained.

When a test of this sort is in its early stages the amount and rate of wear will vary widely, but after an initial period the curves plotting wear against revolution and against work turned toward the horizontal axis. After this preliminary wearing-in period, the loss of weight dropped to very low values in the presence of a lubricant, and it appeared impracticable to develop with any degree of certainty differences between the alloys. Therefore, it seemed necessary to make wear tests *without* lubrication.

These results appear to be consistent with the view that after an initial period in which the contact surfaces "wear-in," good bearings will undergo little or no further wear so long as complete lubrication is maintained.

Dry Sliding Friction at Ordinary Temperatures

Wear tests under sliding friction without oil were attended by difficulties even at fairly low contact pressures. The temperature of the bronze quickly raised and resulted in a marked flow of the surface metal. Under such conditions it was difficult to determine how much wear and how much plastic deformation took place. Likewise, variations in the frictional and thermal properties of the different metals probably produced variations in the temperatures reached, and direct comparisons of the results did not seem justified.

Such difficulties were minimized with the lower rate of slip and the small area of contact between the two disks in tests under combined rolling and sliding friction. There was less heat developed in a given time, despite the relatively high unit contact pressures, and there was probably also a better opportunity for dissipation of the heat resulting from the frictional forces. Therefore, wear tests without lubricants described herein were made under combined rolling and sliding friction.

The first tests were characterized by erratic losses in weight; individual specimens did not show consistent rates of wear in consecutive tests, even after a preliminary period. In addition to a change in the roughness of the contact surfaces from the original ground finish, a change in color occurred, and what appeared to be a coating or film was frequently observed. Formation of such coatings seemed to be related to changes in the wearing and frictional properties of the metal. The compositions of these films are not now known, but they are apparently of two types. The first, comprising films which looked like copper oxide, was observed in the copper-tin alloys which were low in lead. These same films also occurred in the high-lead bronzes, but they were not so easy to detect in the latter alloys, due to the more frequent formation of a second type of coating, viz., a black film which was either lead or a lead compound. Tests so far made, including X-ray analysis, have failed to reveal the exact nature of these surface effects.

However, it appeared certain from the preliminary wear tests of bronzes without lubricants, that film formation played a part in the erratic results, and that some method of eliminating or controlling these films should be provided if consistently uniform results were to be obtained. Copper scrapers were used and minimized but did not eliminate film formation.

Single Blow Impact Tests

Single blow impact tests were made on notched specimens with an Izod impact machine.

All except the low-lead alloys had very low impact resistance. Increase in lead up to 25 per cent caused progressive decrease in the impact values at all temperatures between room temperature and 600 deg. Fahr., the first few per cent of lead having greater influence than a corresponding variation in the high-lead range. Increasing the tin up to about 5 per cent increased the impact resistance, but with higher tin the impact values decreased somewhat. These effects of lead and tin were more marked in the sand cast than in the chill cast bronzes, except that in the low lead alloys the chill cast specimens showed higher impact values at some temperatures. In general the impact strength decreased slowly with rising temperature up to 350 deg. Fahr., and then dropped off rapidly.

The finely disseminated small particles of lead in the chill cast bronzes probably produce greater weakness under impact than the large lead particles in corresponding sand cast analysis, and may more than offset the benefits of the finer grain structure of the copper-tin constituents.

Pounding with Repeated Blows

Small cylindrical specimens were subjected to repeated blows in compression both at atmospheric and elevated temperatures. The rate of deformation of some of the bronzes decreased as the pounding proceeded, due to gradual work hardening. The initial high rate of deformation increased with the lead content and decreased with the tin content. Sand cast bronzes usually showed higher initial rates of deformation.

It was found that the deformation produced by a given number of blows increased rapidly with lead content up to 5 per cent, and but little beyond this. The rate of deformation decreased slowly with increase in tin content up to 5 per cent and then rapidly from 5 to 10 per cent tin. The effects described above were also observed at the temperatures up to 600 deg. Fahr., although the actual changes due to variations in composition and casting conditions were less than at atmospheric temperatures.

General Discussion

No one laboratory test by itself gives enough information to determine the suitability of different bronzes for industrial applications. Comparison must still be based on a broad knowledge of the characteristics of the different

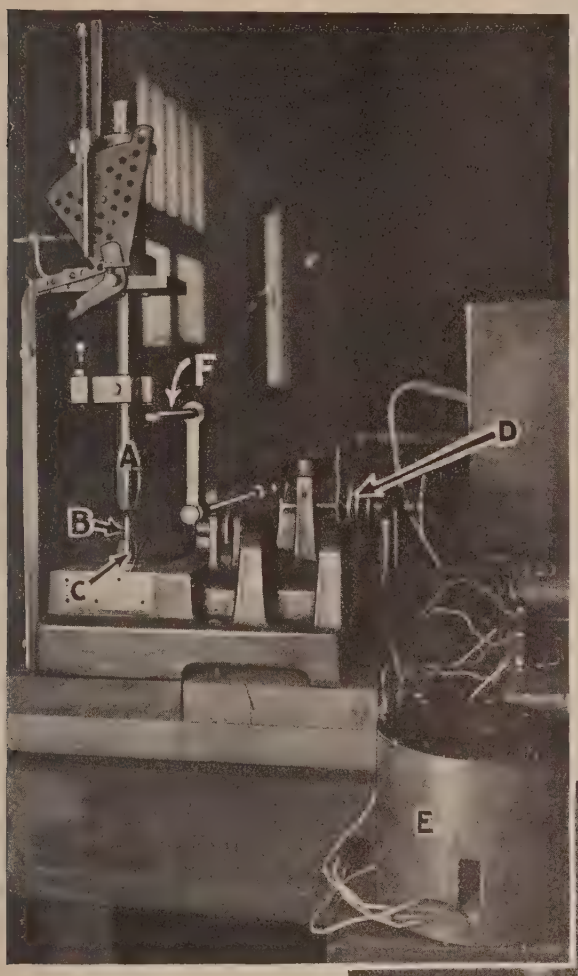
bearings determined from varied tests and from service records.

Variations in chemical composition change the mechanical properties, to be sure, but within certain ranges the chemical composition is less important than the casting conditions. With a few exceptions the chill cast bronzes wore faster in these tests and had less resistance to single blow impact on a notched specimen than the same analysis when sand cast, but were more resistant to repeated pounding and to static tension.

There is still room for considerable argument on the relative merits of chill cast and sand cast bearing liners, and the casting method used should depend on the service to which the part is to be subjected.

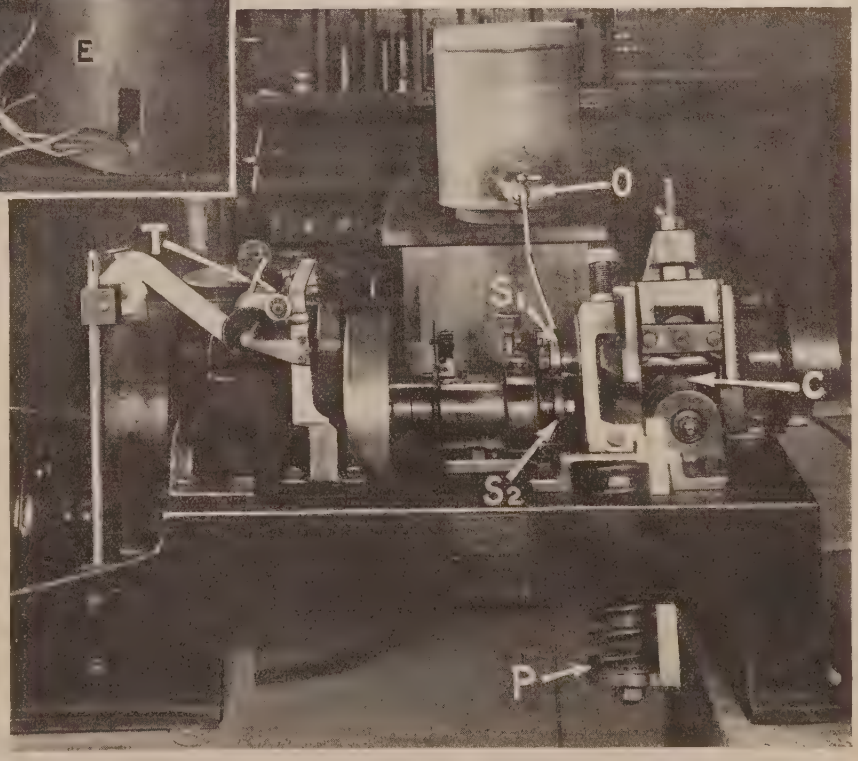
Specifications might well be limited to a series of relatively few compositions with liberal tolerances for the major components. The analysis chosen and the casting method will naturally depend on the service. The wide variations in present specifications for bearings destined for similar service, and the narrow composition tolerances specified by many companies, are not always justified. Naturally, the effects of impurities and other intentionally added components besides copper, tin and lead will have to be studied before any complete specification can be drawn up. A study of heat treatment of these alloys to produce desirable properties is also advisable.

As to the bronzes investigated, those containing less than 5 per cent tin had poor mechanical properties, wore badly and were apparently unsuited for general bearing service except possibly for applications involving low loads. Bronzes containing 5 to 15 per cent of tin and 12 to 25



EQUIPMENT Used in the Repeated Pounding Tests. Specimen *B*, on anvil *C*, is subjected to repeated blows in compression by the falling weight *A*. Furnace *E* is used for tests at elevated temperatures. *D* is the driving mechanism and *F* prevents auxiliary blows from rebound of *A*. Tests were made with a weight of 7.15 lb. falling through a distance of 2 in. (at Left)

AMSLER Wear Testing Machine. Surfaces of S_1, and S_2 move in the same direction but at different speeds with lateral oscillation produced by cam *C* and under contact pressures controlled by spring *P*. Friction is recorded on the torque indicator *T*. In tests with lubrication the oil is supplied from reservoir *O*. In all tests the total load between specimens was 37.5 lb.; the slip 12 ft. per min.; the amplitude of lateral oscillation 0.3 in. (Below)



per cent of lead can meet a wide range of service conditions. These bronzes do not wear as fast as low lead bronzes and the surface does not roughen as rapidly when lubrication fails.

Where mechanical strength is essential it is desirable to keep the lead content near the lower limit of the range. For many purposes the bronzes containing 15 to 25 per cent lead should be interchangeable, since the changes in mechanical and wearing properties with lead content are small.

The results of these tests lead to a grouping of bronzes consistent with the American Society for Testing Materials tentative specification B67-27T for journal bearings on railroad rolling stock, according to which the tin may vary from 5 to 7 per cent and the lead from 15 to 22 per cent.

Hardened Copper for Electrical and Chemical Equipment

USES and properties of the hardened coppers known as "everdur" and "tempaloy" and their welding characteristics were described by W. R. Hibbard, technical department American Brass Co., Waterbury, Conn., in a paper read before the International Acetylene Association, Nov. 14. Physical properties are summarized in the table. It will be noted that these cold rolled alloys have a strength equal to or better than medium carbon steels. Everdur possesses excellent welding characteristics when welded by the oxy-acetylene process. It is non-rusting and non-magnetic, and resists corrosion, particularly of hydrochloric acid and chlorides. It will not season or corrosion crack.

Tempaloy was patented early in 1928 by M. G. Corson and is controlled by the American Brass Co. Nickel and silicon are present in the proper proportions to form nickel silicide; when heated to 750 deg. C. or above, the nickel silicide is in solid solution in the copper. It may then be hot rolled or forged. When this alloy is quenched from above that temperature, it is ductile and may be cold worked. The silicide is precipitated from solid solution when heated for a few hours at 450 deg. C., causing the alloy to become hard and strong. Annealed tempaloy can be forged to shape, welded with tempaloy rod, and then age hardened to secure increased mechanical strength in the weld as well as in the base metal.

Generally speaking, it is best to use a welding rod of the same composition as the base metal, but everdur can be used in welding tempaloy. A fused boric acid flux may be used, but for best results add 10 per cent of sodium fluoride. A backing bar is usually necessary. The flame should be slightly oxidizing to concentrate the most heat upon the weld, and its length must be governed by the thickness of the metal.

The alloys containing silicon flow much freer than low carbon steel when using the oxy-acetylene torch, and a film of silica forms upon the surface of the molten metal. These alloys are hot short, therefore cool the completed weld as quickly as possible to the solid state. The concentration of heat over as small an area as possible is likewise desirable and it is, also, advisable to make the weld in one pass.

The electrical industry has found many applications for welded high copper alloys. Motor bars are welded to end rings. Copper-manganese-silicon alloy is non-magnetic and this property is utilized for certain electrical equipment. Housings, barriers, panels and domes for circuit breakers and switch-gear, where the current volume is too high to permit the use of ordinary steel, are now fabricated from everdur, and in others where the current volume is not so great, satisfactory results are obtained by welding everdur inserts in ordinary steel to break the magnetic circuit.

Deoxidized copper and high copper alloys such as everdur are used extensively in the fabrication of heaters, coolers, condensers, evaporators and many kinds of chemical and engineering apparatus. A recent use has been the manufacture of copper radiators for heating buildings, reducing space and weights. It is the general practice to make the header sheet of heavier gage steel than the copper tube and to press it into shape to resist pressure before the holes are punched and reamed to fit the tubes; the latter are then welded as quickly as possible with the minimum amount of heat to prevent warping.

Composition and Physical Properties of Soft and Hardened Copper

Composition, per cent	Tough Pitch Copper	Deoxidized Copper	Everdur: Copper-Silicon-Manganese Alloy		Tempaloy: Copper-Nickel-Silicon Alloy
			Cast	Wrought

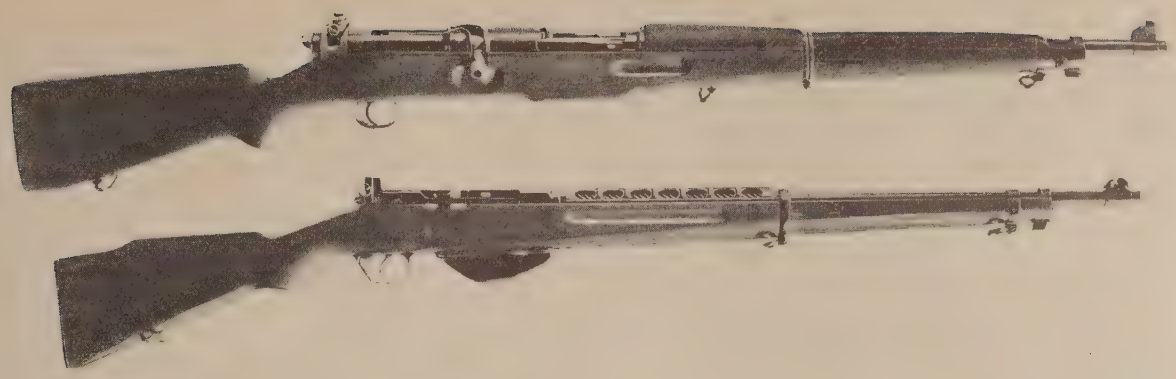
(a) Only one of these is present, depending on the deoxidizer used.
(b) Depending upon the amount of deoxidizer present.
A mild steel has a heat conductivity of 0.117 in the same units.



Heat Treatments for Rifle Parts

Definite Temperature for Rolling the Barrel—Carburizing and Parkerizing Practice Described—Methods of Putting on Color

BY J. B. NEALEY*

ONE highly vital factor to consider in the adoption of a new rifle for Army use is a simplicity of design and manufacture that will minimize confusion and misunderstandings when contracts for its production are let out to a large number of concerns.

This holds true also for the kinds of steel and the various processes by which they are heat treated. This policy of simplification of manufacture has been carried out at the Springfield Arsenal, Springfield, Mass., where fine military rifles have been manufactured for more than a century, and will no doubt be extended to include any new arms that may be accepted.

While there are more than 90 steel parts in this model, only five different steels are used. Specifications for these, for all essential purposes, are the same as the S.A.E. numbers 1020, 1120, 1095, 1350 and 2340, with slight variations. For instance, the rifle barrel steel is close to 1350 S.A.E. and this compares with the War Department specification as follows:

	S.A.E.	War Dept.
Carbon, per cent..	0.45 to 0.55	0.45 to 0.55
Manganese	0.90 to 1.20	1.00 to 1.30
Phosphorus, maximum.....	0.040	0.050
Sulphur, maximum.....	0.050	0.050

Rifle barrels can be made in three ways: Forging, as in the plant of the Winchester Repeating Arms Co.; machining from round stock, as done by the Colt's Patent Fire Arms Mfg. Co.; and rolling, which is the practice at the shops of the Springfield Arsenal. After shearing a piece 13 in. long and 1.4 in. in diameter from a steel billet, it is heated to 1500 deg. Fahr. and rolled by passing it through 12 grooves, all on the same set of rolls.

The piece is reduced and tapered slightly in each groove and when it passes through the last it is roughly of barrel shape, 26 to 27 in. long and ready for heat treating and machining. This rolling operation is accomplished on a single heat. Formerly the practice was to roll from a temperature of 1200 deg. and cool in lime without any further heat treatment, but the present practice, recently introduced, produces much higher physical characteristics.

*American Gas Association, New York. Both rifles shown at top of page are of the semi-automatic type.

With the old practice the following physical characteristics were obtained: Tensile strength, 110,000 lb.; yield point, 75,000 lb.; elongation, 20 per cent; reduction of area, 50 per cent. This mechanical working at temperatures below the critical partially hardened the steel, as does heat treating. However, the maintenance cost of the rolls was very high and later it was found that working at higher temperatures effected a reduction in roll maintenance which more than offset the added cost of heat treating, and materially bettered the physical characteristics.

A series of tests was conducted which included rolling barrels at temperatures from 1200 to 1500 deg. Fahr. and heat treating afterward, with the following results:

Rolling Temperature, Deg. Fahr.	Yield Point	Tensile Strength	Elongation	Reduction of Area
1200	79,533	112,466	21.8 per cent	53.2 per cent
1250	77,717	114,233	21.8 per cent	53.2 per cent
1300	74,966	108,333	24.2 per cent	55.5 per cent
1350	74,276	104,426	25.5 per cent	57.1 per cent
1400	74,950	115,483	23.6 per cent	53.6 per cent
1500	96,773	126,930	20.0 per cent	52.9 per cent

Rolling at the 1500-deg. temperature was adopted. As soon as the barrel is out of the rolls it is straightened in a drop hammer, the temperature then being about 1200 to 1250 deg. It is then normalized by heating to 1700 deg. and allowing it to soak in this heat for about 2 hr., after which it is air cooled. This temperature gives the steel better machinability than did the 1600 to 1650 deg, formerly used. It is then soaked in a heat of 1550 deg. for an hour and quenched in oil for hardness, after which it is drawn at 1100 to 1200 deg. for a period of 2 hr. and air cooled.

The bolt, receiver, etc., are made from 2340 S.A.E. steel. Formerly W.D. 1325 steel was used, but the 2340 S.A.E. was found to give higher physical and better shattering properties. With this steel the flange on the bolt, for instance, will not blow off, and the receiver, instead of shattering into many flying pieces, will simply open up under too great pressure, thereby minimizing the danger to the user.

Heat treating practice for this steel is to anneal at

1550 deg. by putting the parts into a furnace, bringing them up to temperature, turning off the gas and allowing them to cool in the furnace.

For hardening, a salt bath is used, the parts being heated to 1425 or 1450 deg. Fahr. for 5 min. and quenched in oil. They are then drawn in a salt tempering bath at 700 deg. for ½ hr. and air cooled, which gives them a Rockwell hardness of 40 to 50 on the C scale.

Treating the Smaller Parts

Sight parts, cocking pieces, trigger, sear, screws, etc., are made from carburizing steel S.A.E. 1020 and 1120. The sear is the small part which releases the firing mechanism when the trigger is pulled. A "hair trigger" is produced by filing off the top of this piece, and certain users do this. However, it is bad practice, for only a very small amount of filing is necessary to penetrate the case and leave the soft steel to wear away quickly; then there is nothing to hold back the cocking piece or firing pin. Many rifles are returned annually to the Arsenal to have the sear replaced, after such tampering.

In carburizing these parts, they are first packed in pots with charred bone or put into rotary carburizing machines and heated to about 1450 or 1500 deg. Fahr. for varying periods, according to the depth of case desired, which is 0.008 in. in most cases. The cocking piece is held at a higher heat for 4 hr., it having first required 2 hr. to bring it up to this temperature after it was put in the furnace. This produces a case 0.012 in. deep. It is then dumped into a sieve, where the bone is allowed to fall through, and the work gradually dribbles into an oil quench by gravity. Besides producing the case, this treatment tends to harden the core.

The cocking piece is then repacked in bone and reheated to 1300 deg. and held at this temperature for ½ hr., after which it is again quenched in oil. This second heating refines the grain structure of the case and core and reduces the hardness and toughens the core. This last part of the process is necessary, for the firing pin rod is assembled to the cocking piece, which would crack were it not toughened.

The sear is given the first half of this treatment, but the latter part is omitted.

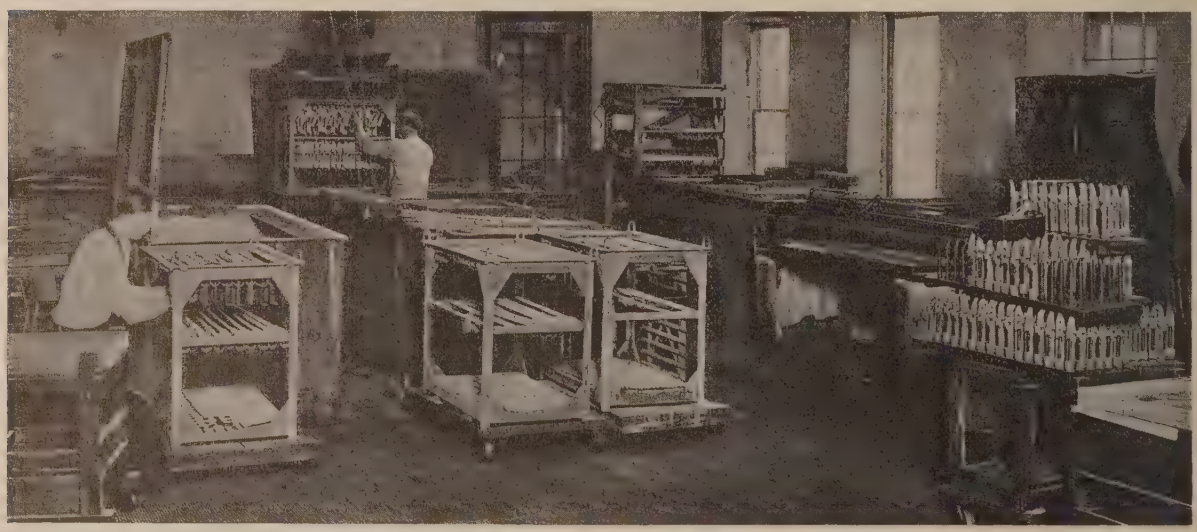
Springs, including the flat spring actuating the follower, are of S.A.E. 1095 steel. These are put into furnaces at 1450 deg. Fahr. and, as they are small, and only 25 on a tray are charged at a time, they are heated in 10 min. and withdrawn and quenched in oil. They are drawn at 770 deg.

Types of Furnaces Used

In the heat treating department gas is used, mixed with air for combustion in a mixing machine. Four brick furnaces are used interchangeably for several kinds of heat-treating work. Each is about 6 ft. wide and 4½ ft. square, and heated with two gas burners in front and two in the rear, firing under the hearth (semi-muffle type). The doors are counterweighted and lifted by pulleys. An indicating pyrometer with a four-point switch serves all four.

There are two pot furnaces, each furnace containing two 10-in. pots holding salt, lead and niter baths for tempering, hardening and blueing. Each furnace is built of brick encased in sheet steel and four gas burners fire each pot, two from the front and two from the rear. Temperatures are checked by an indicating pyrometer with a four-point switch. There is also a small 6-in. cyanide or salt pot which is set in brick and heated with two gas burners.

Facing the above is a row of five furnaces, and the oil, water and brine quench tanks form a row in between. Three of the five furnaces are about 3-ft. cubes and are of the semi-muffle type. They are used for hardening tools of high-speed steel. An indicating pyrometer with a five-point switch is part of this equipment, as well as a recording pyrometer for more particular work.

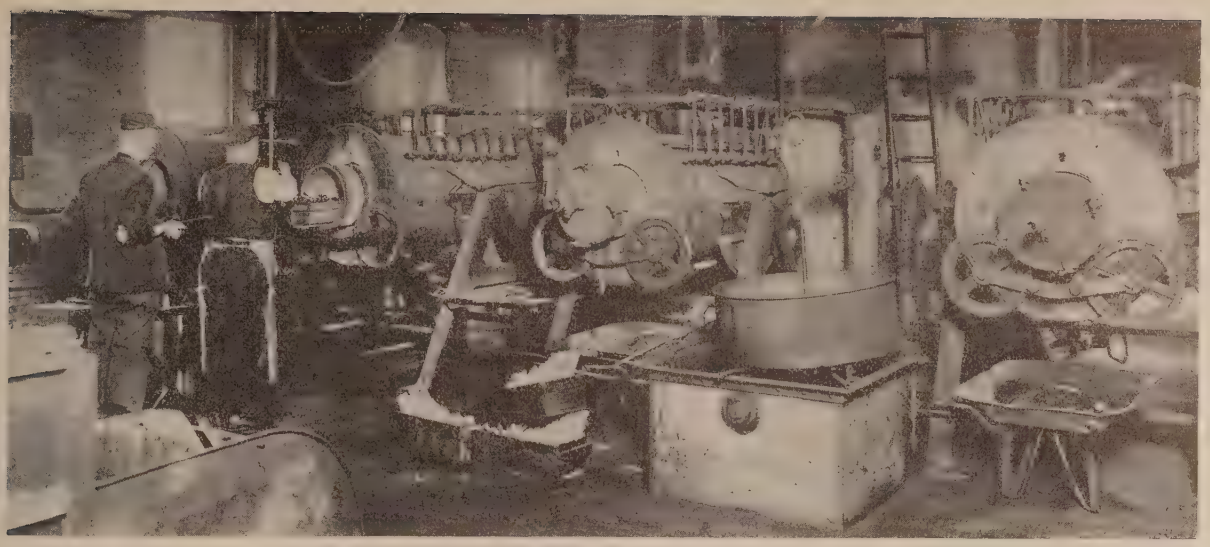


Parkerizing Installation for Rifle Barrels and Other Parts

Handling Reamers and High-Speed Steel

Heat treatment of long reamers is done in a small, circular furnace made at the Arsenal. This is about 4 ft. high and 18 in. in diameter, built of brick, steel encased, and with a 6-in. hole in the center. It is heated with three gas burners spaced at regular intervals vertically and firing tangentially against a steel muffle, which holds the work. This muffle consists of a length of steel pipe capped on the lower end.

A unique unit for hardening small parts of high-speed steel consists of a circular steel shell, brick lined, and divided into three chambers vertically. This unit, which sets on legs, is 2½ ft. high and 2 ft. in diameter and is heated with a single gas burner firing under the hearth. Between each chamber and the next is a refractory tile with the correct number and size holes to permit the passage upward of just the required amount of heat. Thus



Group of Gas-Fired Rotary Carburizing Machines

the temperature of the first chamber is 2200 to 2400 deg. Fahr., the second 1600 to 1700 deg., and the top one 900 to 1000 deg.

Method of Carburizing

Carburizing is accomplished in another room, at one end of which are four rotary carburizing machines. These consist of a steel retort within a steel shell 5 ft. long and 5 ft. in diameter, through which 16 gas burners fire. The retort, 18 in. in diameter, extends from both ends of the shell about a foot. It rests on four wheels, two in front and two in the rear, and is rotated by means of a chain and sprocket, which engages another sprocket wheel fitted over the rear end of the retort. One motor drives all four machines, and one indicating pyrometer with a four-point switch is used to regulate the temperatures.

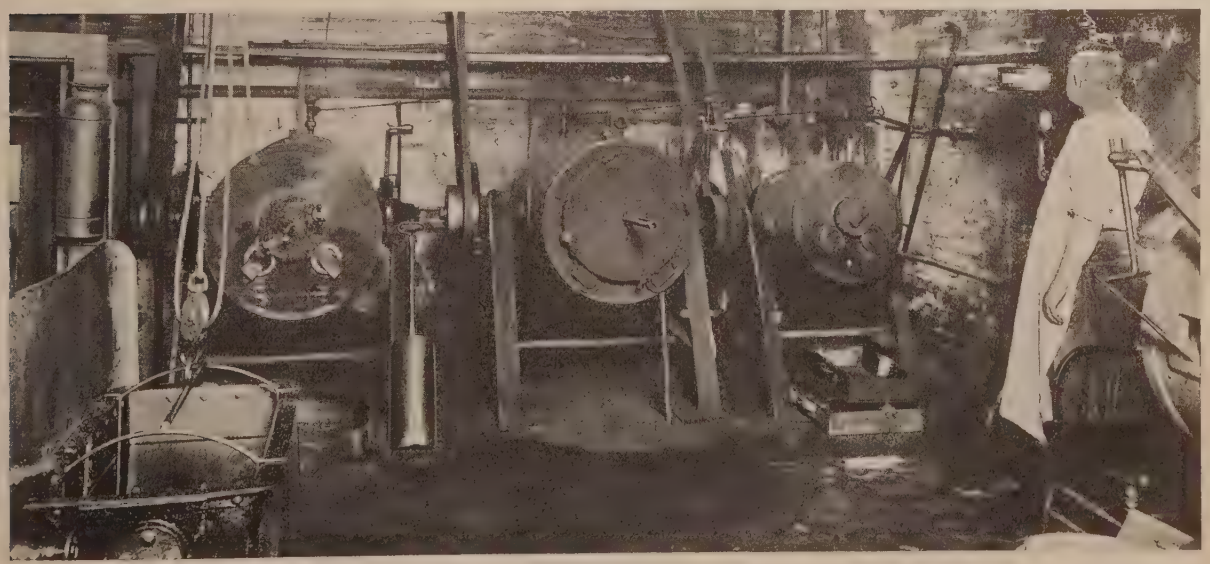
In front are two steel quench tanks with an overhead monorail and hoist with which to handle the sieves and baskets. The steel parts and bone are discharged into a long sieve, the bone dropping through while the work rolls by gravity into the quench where it drops into baskets for further handling.

At the other end of the room are eight more machines, similar in type, except that they are heated with a long gas-pipe burner, located in the bottom of the combustion chamber, the flames impinging on the retort. These are driven from a single motor and are used for tempering and blueing or blackening. They are served with two oil quenches and two indicating pyrometers with four-point switches.

Coloring the Parts as Desired

Oil blackening is carried out as follows: The work is charged into the retort with charred bone, heated to 900 deg. Fahr. and cooled slowly to 650 deg. The bone is then removed, saturated in mineral cylinder oil and returned to the retort, and the whole charge held at 650 deg. for 3 hr. The work is then removed and quenched in oil, which gives it a black finish, which has twice the life of a blue finish. Another method used here is to heat the bone to 1300 to 1500 deg. and quench in oil.

Niter blueing of small parts is accomplished in a two-pot furnace, the baths being carried at 700 to 900 deg. Fahr. The baths are a mixture of nine parts sodium nitrate to one part manganese dioxide. The work is im-



Rotary Gas-Fired Furnaces Used for Tempering and for Blueing and Blacking. At left is the quench tank

mersed for about 5 min., and quenched in cold water; any adhering niter is then removed in boiling water. There are many variations from the above practice. Indicating pyrometers serve every unit.

Parkerizing Applies to Several Parts

Rifle barrels and other parts are Parkerized in a separate room. The parts are first cleaned to remove dirt, oil and scale, a soda wash and sulphuric acid pickle followed by a rinse being used. The work is then placed on a circular cast iron grating, the barrel excepted, which revolves and carries the parts through a booth where sand under 50 lb. pressure is forced on to them through a series of nozzles. The barrels are sand rubbed.

All parts, including barrels, are then placed in steel racks, handled by an overhead monorail system, and the racks, two to a tank, are placed in the Parkerizing solution. The barrels are stoppered at both ends. When first put in, hydrogen gas is given off. The work is kept immersed until this action stops, which occurs within 1½ hr. This solution is kept just below the boiling point. The work is then washed in boiling water and dried in cabinets. The surface of the steel is charged into an insoluble phosphate, highly resistant to oxidation.

Test Bars Vary with Size of Castings in New Standards

BY W. ROLAND NEEDHAM*

DUE principally to researches made under the auspices of the British Cast Iron Research Association, new British engineering standards have been issued covering test pieces for gray iron castings. In the past it is to be feared that the use and interpretation of test coupons has been perfunctory and casual, because everyone connected with the design and production was aware that the mechanical properties varied appreciably with the thickness of the section; nevertheless one size of test bar did duty for everything from an engine bed plate to a small bell crank.

Research has made it quite clear that the average tensile strength of gray iron decreases the thicker the sections, since the rate of cooling in the mold profoundly affects the solidified metal. This is particularly noticeable in large masses, the outside surfaces setting considerably before the inner metal. Consequently, there is a comparatively weak and spongy core encased within a harder shell.

Both tensile and transverse test-pieces are now graded in cross section to suit the material they are intended to represent. For tensile tests there are three standard diameters to represent three distinct ranges of casting thickness. Disparities are thus reduced within narrow limits.

Three Thicknesses and Two Grades

For transverse tests, too, three sizes of circular bar are now made to serve for these three casting thickness ranges. Values for the breaking loads are also tabulated to accord, not only with the nominal diameters, but also with small casting variations therefrom. This is just as it ought to be, because bending stress varies inversely as the diameter cubed. Because metal in the casting crystallizes radially, this should favor the circular shape rather than rectangular bars for bending tests. Furthermore, square corners are a source of weakness, since they tend toward the formation of always undesirable cleavage planes. It is thus doubly appropriate that the test-piece should more nearly approximate the condition enforced by correct design: i. e., that liberal fillets and semi-circular or well-rounded terminal contours be provided.

Briefly, the new provisions for the tensile test are as follows: A ⅞-in. diameter cast bar is turned in the waist to 0.564 in. and this serves to represent castings up to and including ¾ in. thick; a 1.2-in. cast bar is turned to 0.798-in. waist diameter to answer for casting thicknesses above ¾ in. and up to 2 in., while for thicker pieces a 2.2-in. cast bar is turned to a waist diameter of 1.785 in. In each case the gage points are a minimum of 2 in. apart. The minimum ultimate tensile strengths for these three bars are 12, 11 and 10 gross tons per sq. in. respectively for grade *A* material, and 10, 9 and 9 gross tons per sq. in. for grade *C* cast iron.

*Engineer, design department, English Electric Co., Ltd.

It may appear somewhat contradictory to machine the cast specimens to a considerably smaller diameter. It does sacrifice some of the strongest material, but it removes surface inequalities characteristic of a cast bar. Practical considerations enforce a compromise, and the balance probably gives a close approximation to the correct result.

Values Specified for Round Transverse Test Bars

Transverse test-pieces nominally ⅞ in. diameter, 15 in. long, to span supports 12 in. apart, are made for castings up to and including ¾ in. thick; 1.2 in. and 2.2 in. diameter bars, 21-in. long for 18-in. spans, represent castings between ¾ in. and 2 in., and above 2 in. respectively. Great pains have been taken in tabulating central loads and deflections for the three thicknesses and for both grades of iron, for diametrical variations in steps of plus and minus 0.05 in. As illustrating the effect of plus or minus 0.10 in. in grade *A* material, a transverse bar 0.775 in. diameter must carry a minimum of 835 lb., whereas the load for a bar 0.975 in. diameter reaches 1620 lb.

Modulus of rupture does not appear in the specification, but is a useful relative value. It also decreases as the casting thickness increases. The approved figures are: 54,000, 50,900 and 43,000 lb. per sq. in. in grade *A* iron; 43,900, 42,400 and 38,500 lb. per sq. in. for grade *C* iron corresponding to the three sizes of bar.

The specification permits the use of bars either cast on or cast separately, as the engineer may prefer. If the latter, it is stipulated that the bars must be poured at the same time and from the same melt as the castings they represent.

Reclaiming Axles with Surface Cracks

Tests at University of Illinois directed by Prof. H. F. Moore indicate that car axles which have developed fatigue cracks in service may be safely used after they are turned to a smaller size, and at least 1/16 in. below the bottom of the crack. If the material is removed only to the apparent bottom of the fatigue cracks, the tests show that not all the damaged metal is removed.

A theoretical result of interest contained in the report (Bulletin 197, Engineering Experiment Station, Urbana, Ill.) is that heat treated axles of 0.45 carbon steel may have lower endurance limits, as determined on "Farmer" specimens, than others made of 0.55 carbon steel, not heat treated after forging, even though the ultimate and impact strength of the former are materially higher. Furthermore, tests using 0.3-in. diameter "Farmer" specimens give endurance limits about ⅓ higher than those for specimens 1 in. or 2 in. diameter.

Getting the Best Out of Equipment

Whether to Add New Manufacturing Units or Remodel Existing Ones—Weighing the Relative Investments

BY JOSEPH R. MILLER*

IN considering ways and means of obtaining an increased output of a given product from an existing works the question of installation of additional producing units similar to existing units is weighed against the possibility of altering existing equipment. The addition of new units involves an expenditure of known magnitude, additional operating force, additional power costs, etc.

Alteration of existing equipment usually involves features of uncertainty as to the outcome; such a procedure being as a rule considered in the light of an experiment, but carrying the possibility of less investment and less labor and other charges, which in many cases means the saving of large amounts in the capital investment and a marked increase in earnings from the capital already invested. Often the successful accomplishment of such alterations constitutes the point of difference between a very prosperous concern and one that loses money in its operations.

¶ Often successful alterations point the difference between a very prosperous concern and one which loses money.

* * *

¶ Question: What part of the equipment or what movement of the material is blocking the way toward more rapid production?

* * *

¶ Few operating men and few engineers are trained in research methods; still fewer research men are practical—an unusual type is required to discover opportunities for improved operations.

* * *

¶ Examples of betterment touched on by the author include: Shortening non-productive movements of a drawbench; reducing the blowing time of a Bessemer converter; increasing the speed of flow of stock through a blast furnace.

Competition Permits No Standstill

There can be no doubt that any concern which is to stay in business must make those changes in equipment and methods demanded by the progress of competition. However, it is not always the concern having the newest plant that shows the largest earnings. The older concern which is operating a plant that has already paid for itself has that as an advantage over the one with the newly built plant. It has, besides, the opportunity of making comparatively inexpensive alterations, in the light of operating experience, both in old equipment and design of additions.

Such a plant can outstrip the new plant in earning power, as may be seen by comparisons of the earnings of certain plants during the last two or three years.

In reviewing some major operations in the production of steel the fact stands out that the industry has in the past been very slow in making those changes in the design of producing equipment that favor increased production in proper quality. In fact, for a number of years (some time back) it might be spoken of as having, comparatively, drifted.

There is at present a tendency toward a resolute attempt to make progress in this direction, with consequent better earnings in those quarters in which the attempt has been successful. The drawback seems to be that few operating men and few engineers have been trained in the methods of the research worker, and still fewer men in the research field are inclined to be practical. An unusual type of man is required.

The principles involved in the study of an operation and its equipment from the standpoint of a contemplated improvement are not complex. The question to be asked is simply what part of the equipment or what movement of the material under process is blocking the way toward a more rapid rate of production. Nor is the problem any more complex in the case of a large operation than in the case of a very small operation. The risk involved, only, is greater.

Increasing Production of Cold-Drawn Bars

SOME years ago the writer was called upon to increase, if possible, the output of a shop producing a range of sizes of cold-drawn bars, mostly rounds from ¾ in. to 2 in. in diameter. The major operation, that of drawing the bars through the die, was done on two benches operated by high-pressure hydraulic power. The speed of pulling was a satisfactory compromise between the production and metallurgical requirements. Also, the operators were highly efficient.

There were, however, two features that restrained, unnecessarily, the production rate. One feature had to do with the ejection of the drawn bars from the cradle of the machine. Here two slow motions of an ejection mechanism were replaced by one rapid motion. The other feature was the slow return of the drawing head. A minor change, in the valve openings and connecting

*A graduate of Oberlin College, Mr. Miller has worked in the Lorain, Ohio, plant of National Tube Co., South Side works of Jones & Laughlin Steel Corporation, and with Erie Forge & Steel Co., Erie, Pa. His experience has been unusually broad, including inspection, testing and metallurgical engineering, steel making and rolling and cold rolling and cold-drawing of steel. For a time he was superintendent of open-hearth and Bessemer at the South Side works.

piping, accomplished a fast return of the drawing head up to the limits of control of its movements.

Thus by very slight changes involving minor expenditures, entirely within the range of repair charges, these benches were made to produce nearly 40 per cent more bars of the same good quality as formerly, and the shop immediately responded to a 40 per cent expansion of its capacity without an additional capital layout or extension of the floor space. Here we said: We cannot increase the drawing speed, due to metallurgical limitations, but we can increase the rapidity of other movements of production that have no bearing on the quality of the product.

Speeding Up Bessemer Blowing

ANOTHER instance in which advantage was taken of a limiting condition in operation is that of a Bessemer plant making 9-ton melts, the blowing time of which on the general run of iron was 14 min. The ladle-handling equipment was limited to 9-ton melts and could perform properly down to 8-min. intervals. Thus the limiting condition in the production rate of the plant was the time of blowing.

It was decided to increase the diameter of the vessel and the number of tuyeres, in this way reducing the depth (and pressure) of the charge and increasing the rate of supplying air while blowing. A favorable consideration at the time of making the alteration was the bad condition of the shells, which required their replacement. By moving the outboard stand as far as possible, it was calculated that the vessel could be enlarged to a diameter that would accommodate the necessary added air openings to bring the blowing time down to about 9 min.

The reduced depth of the charge, it was thought, would reduce the tendency to spitting, and there were indications that the new operation would improve rather than interfere with the chances for making Bessemer steel of good quality. The change was made as contemplated, resulting in a gain in production rate of good quality steel of around 30 per cent.

An example in major operations that stands out as illustrative of this method of study, although arrived at by slower degrees and by less direct planning, is the blast furnace with the large hearth. In the operation of reducing ore the feature limiting production in any furnace is the speed of movement of the stock down the shaft. In blast furnaces of ordinary design the stock moves more slowly than would be required merely for proper reduction and metallurgical reactions.

The enlarged hearth not only provides the receptacle for the increased output of iron; it also so modifies the bosh angle as to facilitate a more rapid movement of the stock downward, which results in increased activity of the furnace, providing at the same time more room for the introduction of blast.

Whether, if some one had planned such a change ten years ago, the owners would have had the courage to try it is questionable. The reasoning would at that time have been sound, with the possible uncertainty concerning the metallurgical features. This, of course, would be enough to deter any action other than a gradual transition toward the lines as now adopted. In this case the more radical change in high-cost equipment involves a considerable increase in investment, which could not be made in the face of any uncertainty, although a study of the extent of uncertainty might have been made.

In these three examples have been outlined: First, a simple mechanical problem involving small expenditure; second, a more complicated problem introducing metallurgical considerations already somewhat well understood, and greater expenditure; third, a problem involving not only an extensive change of major equipment but metallurgical features not previously studied to the extent required for making a reasonably sure prediction of success. All of these cases bring out the features essential to the study of production methods and equipment that have to do with quantity and costs.

The call for greater productivity is legitimately based, not only upon an increasing number of individuals, but upon the increasing needs and requirements, wants and desires of each individual and the broadening of his life. It is a natural call, therefore, and not an artificial or fabricated state of affairs. He who uses to best advantage the tools of production that are already in his hands profits thereby.

Solderless, Puttyless Skylight, Built of Angle Iron

THE two skylights now under construction at the plant of the Auto Specialties Mfg. Co., St. Joseph, Mich., are fabricated from 2 x 2 x 3/16-in. ingot iron angles, without the use of putty or solder. One skylight is 16 ft. wide and 220 ft. long and the other is 10 ft. wide and 220 ft. long, with five ventilating units. Each unit is operated with Dayton operators. The skylight, which was developed by the Michigan Fireproof Skylight Co., Benton Harbor, Mich., has been put on the market to take the place of monitor-type construction for factories, foundries, laundries and garages.

German vs. American Steel Practice

Differences Analyzed, with Reasons for Divergence—Germans Ahead in Combustion; Americans Lead in Mechanisms

BY F. L. ESTEP*

AS is well known, the United States leads the world in production of steel and Germany has again become second. Most of the steel made in the United States is used domestically, whereas a large percentage made in Germany is exported. This has had a certain influence upon the processes developed and methods pursued in the two countries, as has also very materially the supply and cost of raw materials. Another factor which has affected the methods and the equipment used is the quantity and quality of labor available and the wages which must be paid.

In Germany the greater percentage of ore used comes from foreign countries, while in the United States the great bulk is mined at home. Coal is plentiful and of good quality in Germany, but its price for metallurgical purposes is higher than that used here for the purpose.

[Coke plants, blast furnaces, steel making, soaking pits, blooming and heavy finishing mills, plate mills, merchant mills, rod mills, sheet mills, tin mills and tube mills were taken up successively by the author and the characteristics of each, in the two countries, briefly described. In particular, he pointed out the divergences and told the reasons for the differences noted. Following is a brief abstract of some of the outstanding points.—EDITOR.]

Blast Furnaces

IN the United States a blast furnace shell, supported by a mantel and columns, carries the weight of the top and superstructure, and incloses the brickwork. In Germany the furnace lining is usually built and held together by bands, and separate columns extend from the ground to top of the furnace to carry the weight above.

The United States leads in number and percentage of large furnaces. There are perhaps six furnaces here which have averaged over 1000 tons a day for at least one month and one furnace which averaged over 1000 tons a day for all of 1928.

Because of the comparatively high price of coal, it has always been essential that a steel plant in Germany operate at the highest possible thermal efficiency. If and when Germany uses individual blowing units on each furnace, and when they size the raw materials, then, in conjunction with the 20 to 30 per cent of sintered ore in the burden, it is believed that Germany may again take the lead in output per furnace.

Steel Making Operations

IN Germany about 45 per cent of the total steel is made by the Thomas process. The remainder is made in open-hearth furnaces, usually stationary, where practically all of the scrap made in the plant is melted. Thomas steel is used for ordinary products, such as rails, structurals, merchant material, rods and wire. Open-hearth steel is used for seamless tubing, sheets, tin plate and other products where this grade is better suited.

In the United States the percentage of the total production of steel ingots by the Bessemer process has steadily decreased over the last 30 years. In 1900 about 65.5 per cent of the total was made by this process, but in 1928 only 13.1 per cent, although the tonnage was almost the same.

Because of the predominance of Thomas steel in Germany, an arrangement of plant different from American plants has been possible. Thomas steel can be poured and stripped very quickly, and for many products can be brought to a rolling temperature without fuel by merely inclosing in a single ingot pit for about 2 hr.

Construction of stationary open-hearth furnaces in the two countries is generally the same, but there are some points where they differ more or less radically. United States furnaces are equipped with water-cooled doors, frames and ports to insure the longest life and the minimum delay in production. Water cooling is not done on German furnaces to any marked extent. Many American furnaces are also built with sloping backwalls, which greatly increase furnace life and minimize delays.

In Germany checkers have been developed to a much higher degree of efficiency in heat transfer than is common here. They are building checkers of large volume and extreme height, making it possible to preheat the air and gas to a very high temperature. This means also that the temperature of the stack gases is much less than here—so low that it is uncommon to find a waste-heat boiler on a recent open-hearth furnace in Germany.

Fuel consumption per ton of ingots in Germany is generally considerably better. This is partly due to use of a mixture of blast-furnace and coke-oven gas in open-hearth furnaces, this having been developed to a high degree of efficiency and reliability.

Blooming and Heavy Finishing Mills

FINISHING of rails, heavy and medium structural shapes, and some special shapes is done in Germany almost universally upon two-high reversing mills, consisting of two or three stands adjacent to and usually in line with the blooming mill. Finishing is done from the original ingot heat. The blooming and finishing mills for this class of product in Germany are somewhat larger than those in common use here.

In the United States a mill to roll rails or structurals up to 24-in. beams is arranged differently. Here it is customary to bloom an ingot, deliver it on the back side of the mill, crop it and send it in blooms of proper lengths to the finishing mill. In some few installations a two-high reversing rougher is interposed between blooming and finishing mills. In many American plants sections corresponding to those which would be rolled, in Germany, direct from the ingot heat are reheated before rolling.

It is practically a certainty that, for the majority of

*Chief engineer, Perin & Marshall, New York. This is an abstract of a paper presented before the Metropolitan section, A.S.M.E., Nov. 12, and sponsored by the Iron and Steel Division of the society.

products which can be rolled direct from the original ingot heat, if mills of the two types were installed side by side, given the same materials to roll into the same finished products, the American mill would produce a greater tonnage in given length of time with less labor. The first cost of the American installation would be little if any higher.

Tube Mills

Tube mills can be classified as three kinds: butt weld, lap weld and seamless. In manufacture of pipe by the butt-weld process, the United States is far ahead of Germany in tonnage and equipment. Germany has few butt-weld mills and all are of antiquated design and operated inefficiently. In the winter of 1928-29 the first installation of a butt-tube mill equivalent in design, capacity, etc., to those in common use in America was installed. Practically no lap-weld pipe is made in Germany.

In manufacture of tubes by the seamless process Germany has always led the world. The United States has been backward in adopting this process.

Further Divergences Noted

ENGINEERS of the more advanced nations, in tackling metallurgical and other steel-making problems, will achieve results which are practically identical in all fundamental respects, according to a letter from F. C. Biggert, Jr., vice-president and chief engineer United Engineering & Foundry Co., Pittsburgh, which was read by Stewart M. Marshall at the conclusion of Mr. Estep's paper.

There are essential differences between the plant layouts in Germany and the United States, according to a letter from H. J. Freyn, president Freyn Engineering Corporation, Chicago. In the United States the layout is along simple lines, providing opportunities for expansion of departments and providing also easy transportation from one place to another. European plants lack the benefit of an adequate conception of a general scheme and plans for future growth. This is, of course, attributable largely to the fact that many of the plants are so old.

In the United States there is more flexibility in regard to the tonnage produced. A drop of 50 per cent in the output is not nearly so detrimental to total costs as is the case in Germany. In the latter country, Mr. Freyn writes, a diversity of products must be made on a given set of mills. There has been much help recently through mergers, which have made it possible to specialize better.

Furnace Man Has No Control Over Coke

Coke oven plants and blast furnace plants are not under common ownership in Germany, except in a few instances. The coke is made largely at the mines, so that it is the coke which is hauled and not the coal. This condition gives the blast furnace man less control over the quality of his coke.

Germany Leads in Combustion

Mr. Estep's paper might be very briefly summarized by saying that he has accorded the United States the primacy in mechanical features and Germany the lead in combustion, according to a statement by Sidney G. Koon, associate editor THE IRON AGE, New York, in continuing the discussion. With their characteristic thoroughness the Germans have gone into the chemistry of the fuels, whereas the American inventive genius is shown along other lines.

He directed attention to the figures in the paper, telling the rapid growth of the tin plate industry in the United States to a point where it now dominates the world. In particular, the paltry thousand tons made in the United States in 1891 recalled the political history of that period, when Grover Cleveland solemnly assured the American public (and all others) that steel makers in the United States would never be able to compete in tin plate with those in Wales.

Two Ruhr furnaces were cited by Dr. George A. Orrok, consulting engineer, New York Edison Co., New York, both of which have produced over an entire month an average of more than 1000 tons a day. Their maximum days were respectively 1065 and 1100 plus tons. They follow the general design common in recent furnaces in the United States, including skip hoists for charging.

Large centrifugal blowers are getting common on the Continent for producing wind for blast furnaces, he said. These go as high in some cases as 15,000 hp. in a single unit and with good results. Some of the modern gas engine blowers on the Continent are fitted with waste-heat boilers in the exhaust lines. Steam raised in these boilers furnishes power for most of the electricity used in the plants.

Crude Handling Methods Still Used

Discussing another phase of steel mill operation, Willard C. Brinton, president Terminal Engineering Co., New York, spoke of the crude methods still in vogue in transporting certain materials about American steel mills. His remarks were directed particularly at the repair gangs—millwrights, electricians, bricklayers, carpenters, etc. many of whom he had seen hauling or pushing materials by main strength in wheel-barrows or other hand-operated devices, whereas so many of our other manufacturing establishments do all of this work mechanically. He spoke of the great waste in time occupied in this manual effort and the high cost of doing it with men earning high hourly wages.

He made reference again to the change from narrow-gage industrial tracks within the plants to standard-gage tracks. While this is along the line of general progress, it introduces elements which make operation more difficult. For example, the curves on the broad-gage tracks are necessarily much less sharp than with the narrow-gage tracks, which means that materials have to be moved a considerably greater distance. He spoke of one case where a movement of materials to a point about 100 ft. away from their previous location in a direction transverse to the track involved running them one-half mile or more down the track to a switch point, and then back a similar distance.

Differing levels in plants, as, for example, the height of the open-hearth charging floor and the elevation of the stock floor of the open-hearth department about 4 ft. above the general ground level to correspond with the tops of cars on the tracks on the ground, introduce complications in transverse movements. Mr. Brinton made a particular plea for a method of facilitating these transverse movements, with the definite recommendation that they be made on rubber tires. This might be a form of electric truck or other transportation unit, but customarily the ordinary type of motor truck would not fit well into the scheme.

Efficiency of Steel Production

Discussing the matter of efficiency of steel-making units, with particular reference to the element of time efficiency, Stewart M. Marshall, of Perin & Marshall, consulting engineers, New York, referred to a hot strip mill in an unidentified American plant in which a monthly record had been made as high as 84 per cent. This figure is known as the efficiency of the finishing groove. It is obtained by dividing the number of feet of strip made in the month by the number of feet of peripheral travel of that groove as measured by its number of revolutions in the month. Several months this unit has run from 82 to 83 per cent.

Charles P. Perin, senior member of Perin & Marshall, presided at the meeting.

Business Must Change Its Rule

Modern Trends in Production and Distribution Call for Improved Practices and Sacrifices for the Common Good

BY SAUNDERS NORVELL*

MY subject is new trends in distribution of goods. Fully 60 per cent of the influences that make the success or failure of any business are outside of that business. By this I mean that a merchant working in his own business, no matter how thoughtful he may be, no matter how hard he may work, no matter how good his judgment is, if he confines his thinking entirely to his own business, then the factors he covers are only 40 per cent of the total result.

This principle has been illustrated where a harness or a carriage maker did not watch the development of the automobile; gas taking the place of oil; electricity replacing gas; prohibition destroying brewing and distilling; rayon replacing cotton; concrete and steel in buildings superseding wood; steamships replacing sailing vessels, and so on down a whole list of changes that have taken place in trade, and all the other changes that were influenced by these changes.

Changes in Distribution Are Steadily Taking Place

There have not only been changes in industries, but changes are steadily taking place in methods of distribution. Fifty years ago, goods were sold almost exclusively through the channels of manufacturer to jobber and jobber to retailer. Within this period, we have seen the development of the mail order house and the chain store and house-to-house selling. All of these changes took place outside of the business of the oldtime merchants, entirely independent of their business, but at the same time having a profound effect upon them.

Within my own business experience, there were no established rates made by railroads. Different rates were made to different customers. Rebates were a common thing. Rate wars between railroads occurred at frequent intervals. Then came Government regulation, through the Interstate Commerce Commission, the fixing of rates, the laying down of rules by which the railroads are governed—result, the stabilization of the railroad business. Where railroads 40 years ago were almost all bankrupt, frequently passing into the hands of receivers, now they have good credit, are prosperous, are giving the best service in the world, and their stocks and bonds are as good as or better than other securities that can be bought.

Take banking: All the older men in this audience remember the banking panics of the past. A large part of the nation's troubles was the result of banking conditions. Then came the National Bank Law, the Government regulation of national banks. All this at first was opposed by the banks themselves. It was called Government interference with business. Then came the Federal Reserve Bank and the regulation and control of our entire banking system. No one in this audience will doubt that the Federal Reserve has stabilized the banking of the country. Failures among banks are largely the private, not national, institutions.

In the early days, we remember wars between the public utility companies. Now we find our great public utilities, such as the telephone and telegraph companies, regulated by the Government. Their rates are fixed. As a result, these great industries have prospered, have given the public wonderful service, and now their securities are sold broadcast in the land, so that the people have become, in an increasing measure, the owners of the companies that serve them.

All of these things are history, and well known to every business man of average intelligence. But now let us turn to industry, to manufacturing, to jobbing and to

*Mr. Norvell is president of the Remington Arms Co. and the Remington Cash Register Co., New York. His address was delivered before the first Ohio Management Congress at Columbus, Ohio, Nov. 20.

Saunders Norvell says that:

- **Modern business must pay attention to outside influences that affect its future.**
- **The game of selling must be played according to rules that are laid down, giving an equal chance to all the players.**
- **Modern business in every industry must make sacrifices for the common good.**
- **Business must be conducted as a science—reaching the truth by establishing and recognizing facts.**
- **The time is coming when a member of any industry who attempts to take unfair advantage, who will not play according to fair rules, will be ostracized.**

retailing. In these fields, on account of the development of modern selling, of national advertising, of modern handling of salesmen, of changing channels of distribution, the competitive pressure for business has become a tremendous force. Modern selling in its present development has become a Frankenstein, which, unless controlled, like the monster in the story, will destroy its maker. In other words, industry in this country, as I see it, is like the railroads, the banks and the others mentioned above, before they were taken in hand, regulated and the rules of the game laid down and enforced.

The Sherman Law and the Clayton Act laid down certain principles, but these laws are very hazy and foggy. The meaning of the laws on point after point has had to be established by the courts. This has taken a great deal of time and has caused a great waste of money in litigation. Glaring inconsistencies exist in the present interpretations of these laws. Some of these interpretations almost approach the verge of absurdity. I have no time in this address to go into this aspect of the laws controlling distribution.

Unfair Classification of Customers and Secret Rebates Are Current Evils

Some of the glaring evils resulting from mass production, overproduction, high-power selling and national advertising are, first of all, the unfair classification of customers. Manufacturers, for instance, selling a jobber at a certain price and then selling a retail dealer at exactly the same price. Manufacturers selling retailers at a price, and then going to other manufacturers using their goods in the same cities as these retailers and selling these manufacturers, who buy their goods in large quantities, at even lower prices than they have sold their jobbing or retail customers.

Another great evil that is rampant in modern distribution is the secret rebate. Large distributers receive favors not granted to smaller distributers in the same class, these favors placing the large distributers in a position to destroy their smaller competitors.

Along with the above conditions, which I have sketched hastily, we find that modern competition has built up a sales structure, composed of national advertising, district sales managers, branch houses, salesmen and missionaries, which costs immense sums of money, a tremendous burden upon almost every industry. With this modern system that is applied to many lines, the same goods are not only sold once but frequently twice, and in some cases three or four times, all this cost of selling, of course, being added to the cost of the goods, and in the end being paid for by the public.

In the old days, almost every large business was built up as a result of the shrewdness, energy, and occasionally by the crookedness, of one individual. This has led to the saying that every great institution is the shadow of one man. That was especially true in the old days. In those days, we had individuality in business. It was my fortune in my early years to be brought in contact with many of those old-time captains of industry. I think I can say, without fear of contradiction, that the majority of them were exceedingly narrow in their thinking. They cared nothing whatever for the general welfare of their industry.

I can just imagine how one would have been laughed at 40 years ago if he had suggested to one of these gentlemen the idea of thinking first about his industry as a whole and afterward of his own business. These men were woefully ignorant of what was happening in their own industry. They were ignorant of the trend of the times.

Game of Selling in Old Days Played without Rules

Nevertheless, many of them established great businesses and left large fortunes. The reason they did this was on account of the unprecedented growth of this country. The whole United States was opening up. Immigration was pouring into the country. Territories were being turned into States. Railroads were being built. In those days, the country was growing so fast that ignorant, narrow men could succeed. It was only necessary for them to buy goods, to buy more goods, to fill up their warehouses and to send out their salesmen to gather the harvest of ever-increasing orders.

The game of selling in those days was played without any rules. There were all kinds of practices—fair and unfair. Successful salesmanship was largely a matter of inspiring friendship and of physical strength to travel hard, to make long trips and work long hours in taking orders. In those days, when the goods were sold, they were sold. After selling the goods, the jobber or manufacturer felt no responsibility toward his customer. After selling, the next problem was simply to collect.

It was an era in which each man took care of himself and the devil took care of the hindmost. But let me repeat, the great growth of the country, the expansion of business, took care of all the inefficiency that existed in business. Unusual profits took care of heavy losses through bad debts. Chances were taken in the way of credits, because the profits were so large. Means of communication were poor. There were no great papers such as we have today, giving facts and information daily in regard to business. As a result, things were done just as they are now done in China and are never heard of on the outside. Information traveled in small circles, and, as a result, the various merchants were not so much troubled about the things that were done, simply because they never heard of them.

Despite New Environment Old Practices Still Exist

Now, what is the condition today? What are the new trends in distribution? Today, in an entirely different environment from that of 40 years ago, some of the same evil practices of those days are still in existence. The difference between now and then is that merchants know what is being done today. They know of discriminations, they know of secret rebates, they know of price cutting, they know of the wrong classification of trades. They know that manufacturers do not protect their customers, and that jobbers, in turn, do not protect their customers.

On account of our modern methods of distribution, information on all these things is known and is known quickly. As a result, the whole trade is honeycombed with the feeling of distrust, fear and suspicion. Short-sighted salesmen, by gossip, tale bearing and even by exaggeration, stir up and make the situation worse.

As a result of these conditions, many industries are suffering from what has been termed "profitless prosperity." We enjoy a large volume of sales that in many cases keeps our factories going. We pay large salaries to the heads of departments and to the workers in our factories, but when we come to the end of the year and figure up our profits, we find, in many cases, they are exceedingly small or entirely non-existent. Under these conditions, business, instead of being a pleasure and a rational occupation, has become a tremendous grind, full of irritations and disillusions and so wearing upon the executives that the tired business man has become one of our national institutions.

New Rules for Business Must Be Laid Down and Enforced

What is the answer to all of this? To my mind, the answer and the only solution is that the rules of the game must be laid down. We must have fair rules, giving an equal chance to all the players. These rules must be enforced. How could we play a game of bridge today unless there were rules governing the game and unless those rules were rigidly enforced? One reason why the

game of mahjong never got far in this country and soon came to an end was because no one ever knew the rules. Every player set up his own rules, and, as a result, the game usually broke up in a row.

The Federal Trade Commission and the Department of Justice, as they are functioning at present, seem to see this situation clearly. The Federal Trade Commission is working on the problems of each industry. They are helping to lay down the rules upon which the game can be played. They are trying to eliminate unfair practices. They are opposed to secret rebates and special advantages. A number of industries have already visited Washington and have worked with the Federal Trade Commission in laying down the rules for their industries. Great benefits have followed to merchants simply knowing the rules under which they are to play the game.

I happen to know of some of these industries that have taken this course, and there have been some very surprising results. One thing has been the opening up of more information about industries as a whole. In one case, for instance, it was supposed by the manufacturers of a certain line of goods that the annual sales in this country amounted to about $10,000,000. Believing this to be a fact, each manufacturer was dissatisfied with his share of the business. He was driving his salesmen for greater volume. He was suspicious of his competitors' prices. The result was an utterly demoralized business. When the facts were gathered in regard to this industry, it was discovered that, instead of $10,000,000, the total volume of the business was only $3,000,000, and when each manufacturer compared his volume with the total amount, he appreciated the fact that he was getting a fair share.

Now, in conclusion, just a word about the modern merchant as compared with the old-time individualistic merchant. The modern merchant, realizing, first of all, how outside influences are sure to affect his business, must be a very broad student of such influences. If, for instance, he had been in the harness business when the automobile came in, the chances are he would have tapered off in his manufacture of harness and developed something in the line of automobile supplies in his factory. He would not have stuck to the harness business until this business was down and out.

This modern merchant not only must study all the factors surrounding his own business, but he also must seek just as much information as possible as to the general conditions inside of his industry. Instead of being the individualistic merchant of the old days, he must believe in the new spirit of cooperation. Now I do not mean that he must believe in cooperation simply from an altruistic point of view, but he must fully realize that the welfare and success of his own business depend not only upon what his house does but upon the things the other houses are doing. If there are bad practices in any industry, these practices are sure to react upon all the industry. One bad apple will soon spoil the whole barrel.

Sacrifices Must Be Made for the Common Good

This modern merchant must be willing to make sacrifices for the common good, and this is especially true of those executives who are at the head of the largest and strongest institutions. In other words, business today cannot be conducted as it was 25 or 40 years ago. Business to be successful and profitable must be done as a science, and of course we all know the basis of all science is reaching the truth by establishing and recognizing facts. There is no place for ignorant, prejudiced men in modern merchandising. There is no place for men whose judgment is warped by their hatreds.

In my opinion, the weakness of much association work is in the fact that the scope of these associations is too large. There are so many varied interests that these interests cannot be harmonized. These large associations may be of value just in a general way, but it is my opinion that the best work can be done in the trade by smaller associations of merchants covering strictly their own line of business, or parts of their business, such small associations not attempting to do anything illegal in the way of price fixing, but to meet for the purpose of studying and trying to improve the practices in their trade. Not only that, but to try to lay down rules to govern the competition in the trade.

I believe the time is coming when a member of any industry who attempts to take an unfair advantage, to play the game without following fair rules, will have just as much social standing as the member of a high-grade club who might be caught cheating at a game of cards. The time is coming, and must come, when merchants who will not play the game straight will be ostracized and without standing among all fair-minded merchants in the fraternity of their trade.

Conditions Promoting Solution of Cast Iron in Acids

ATTACK of iron and steel by acids has generally been thought of as accelerated by local action. This is particularly true for gray cast irons for, as Bauer has shown, the iron has an electrode potential of — 0.76 volt and graphite a potential of + 0.37 volt, measured against a calomel electrode.

Interesting tests, in confirmation of the local action theory, have been reported by Bardenheuer and Zeyen in Publication No. 132 of the Kaiser Wilhelm Institut für Eisenforschung at Düsseldorf. The investigators made up a series of irons in which the nature of the graphitic constituent was made to vary. The variation was brought about by casting into molds of different shapes and temperatures and by superheating the iron in varying degree before casting.

The loss in weight per unit area in normal HCl, HNO_3, H_2SO_4, and acetic acid CH_3COOH, was then measured. It was found that in nearly every case a fine graphitic constituent was accompanied by rapid solution, while large plates of graphite produced slower attack by the acids. It further developed that no difference could be observed, depending on the manner in which a definite degree of fineness was obtained.

The authors conclude from these facts that local action —that is, a flow of electricity from graphite to iron—is largely responsible for acid attack and that the larger number of graphite centers exposed explains the more rapid solution of those irons in which the graphite is finely divided.

Detecting Copper in Copper-Bearing Steels

BY suitable annealing followed by a 20-min. etch with 1 to 2 HCl, the presence of over 0.20 per cent of copper in low-carbon steels is readily detected, say K. Daeves and G. Tichy in *Stahl und Eisen* for Sept. 19. The process depends on the fact that copper is not readily attacked by non-oxidizing acids and therefore appears as a finely divided residue on the surface of an etched specimen. This residue has the characteristic copper-red color. Annealing to 800 or 900 deg. C. in an oxidizing atmosphere brings out most reliably the copper color.

Fins Cause Unmachinable Castings

Chill to White Iron on Castings from Mixtures Already Adjusted for Highest Practicable Strength and Hardness —Designers and Foundries Both Responsible

BY G. M. EATON*

G. M. EATON

EPIDEMICS of white iron edges on machined surfaces of cylinder heads and blocks for internal combustion engines are often responsible for failure in meeting production schedules. Failure to meet production schedules is a very serious matter, resulting in direct money loss, damaging the customer's confidence in his supplier, and possibly even resulting in the loss of contract business. In addition to these vital commercial troubles, white iron edges produce serious internal shop complications in the shape of heavy tool costs, the failure of pieceworkers to make their rates, and other obvious and expensive irritations.

Chemical Analysis Not a Controlling Factor

An investigation has recently been made into the causes of white iron edges in several specific epidemics of this trouble. The irons investigated included: (1) unalloyed irons, (2) chrome-nickel irons, and (3) chrome-molybdenum-irons. No type of iron investigated was entirely immune from the trouble.

Investigation of each specific case invariably traced the trouble to a common cause, and leads to the belief that it is a constructive service to publish the facts.

In over 90 per cent of the individual castings edged with white iron, the hard edge was due to the presence of a fin on the rough casting, which landed on the edge in question and acted as a chill. Of course the presence of a fin on an edge that is to be machined does not necessarily mean that white iron will be encountered by the tool, but it does mean that when one or more of the variables which tend toward white iron edges, approaches the danger point, the fin accelerates the trouble. Among the variables referred to may be noted (a) high chromium in the analysis, (b) a low silicon iron, (c) low total carbon, (d) cold poured metal, or (e) wet sand.

Molybdenum and nickel when alloyed with gray iron both have a definite tendency to combat white iron edges, but they are not always adequate as a sole preventive measure and it is therefore only common sense to look for further assistance.

The first logical step is to prevent the formation of the fin on the critical edge of the rough casting. This is sometimes a difficult task, but it can often be accomplished if the problem is attacked with determination. The only logical aim for this attack is the production of satisfactory finished castings at the least over-all cost. If the elimination of the fin from the critical edge makes a more expensive pattern, core box, or core, this must be weighed against the ultimate dollars lost in the machining operations due to the practice which produces the trouble making fin.

There are two general methods for preventing the formation of fins on edges which are to be machined.

First, move the parting line so that the fin lands on the rough casting, as far remote from the machined surface as possible.

Second, grind the cores to a fit so close that the fin is of immaterial thickness.

Moving the parting line will often require the cooperation of the mechanical engineer responsible for the design of the part.

For example, one of the most troublesome hard edge epidemics occurred at the bottom end of the bore of internal combustion engine cylinders. If the detail drawing calls for a square corner at *A*, Fig. 1, it is a foregone conclusion that the pattern maker will arrange for a simple cylindrical core, and the rough casting will show a fin as at *B*, unless the cores are very carefully ground to a close fit. If, however, the detail drawing shows a round corner as at *C*, with the finish bore running out as shown, the fin will be located at *D*, and there will be no white iron encountered at the end of the bore—unless some of the variables noted above have slipped so far that the entire bottom end of the cylinder is white iron.

Another practical illustration is found in a lot of split casings, as shown in Fig. 2. White iron was encountered at *A*, on half the casings in this lot. The parting line was at *B*, and fins developed as indicated by the cross hatched areas *C*.

The white iron was just heavy enough to cause trouble on the edges; moving the parting line to *D* would be easy and would make a very real improvement.

A third and final illustration where white iron resulted from a sharp isolated corner, even where no fin existed, is an epidemic on several lots of automotive cylinder-head castings. This trouble took the form of white iron edges at *A*, Fig. 3, on the bolt bosses.

To correct the trouble the identical weight of metal could perhaps be employed to make the top of the boss of an elliptical cross section, as at *B*, with no opportunity for white iron to form, unless some detail of the foundry practice is very far from proper. It is a surer procedure, however, to add a little more metal as shown at *C*, and thus insure that the finishing operation will clean up the boss to full diameter.

Modify Molding Practices for Stronger Irons

This last is an illustration of a condition where the designer can be of material assistance to the foundry and the machine shop.

There are a number of very logical reasons for the increasingly serious situation created by white iron edges.

*Molybdenum Corporation of America. Sometime chief mechanical engineer, Westinghouse Electric & Mfg. Co.

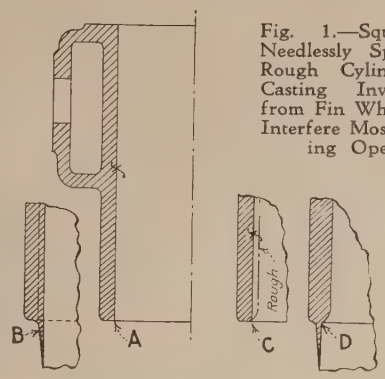


Fig. 1.—Square Edge Needlessly Specified on Rough Cylinder Block Casting Invites Chill from Fin Where It Will Interfere Most with Boring Operation

Some of these reasons work together to create conditions which are hard to correct, and yet which should and can be corrected.

The designer takes the position that he uses time-honored practices in proportioning his iron castings and that the foundry must be responsible when a type of casting that was satisfactory a few years ago begins to give trouble. A similar stand is made by the pattern maker, and by others along the whole line of production. The trouble is not due to change in their practices, they say.

Such a situation is particularly hard to handle when the castings are purchased outside of the manufacturing organization, where there is a division of responsibility, and where each party is guarding his own costs carefully.

The weakness of this widely held opinion lies in the fact that the *gray* iron, around which the present design and molding technique was evolved many years ago, was a very different material from the iron which the designer demands today. Where Brinell values of around, say, 160 were once satisfactory, the designer has been forced by competition to raise his Brinell requirements to 190, or even to 210 Brinell on castings for services absorbing tremendous tonnage and demanding increased strength and wear resistance.

This boosting up of the strength and hardness of gray iron simply means that the foundry has been pushed closer to the limits of practical production of machinable iron, and this evolution automatically lays on the designer the responsibility for modifying his castings in every reasonable way, to ease the problem confronting the foundry.

Most able designers need only to have this condition placed before them clearly, to grasp the necessity of modifying their designs so as to effect the greatest possible overall reduction in the cost of their ultimate product.

When unmachinable iron is reported by the shop, the designers who are in this broad-minded group will attack the trouble on this basis: "Due to the recent fundamental changes in gray iron there is in all probability something I can change in the design of this rough casting, that will eliminate or at least ease up the trouble."

The fundamental point at issue may be summed up very tersely as follows:

The present technique of design for gray iron castings is directed almost exclusively toward the *finished casting*, whereas the only safe basis is the sharpest possible attention to the *rough casting*, exactly as it comes from the sand, including all fins and other excrescences heretofore considered as only incidental to the finished product.

Responsibility of Executives and Designers

This calls for so much hard plugging on the part of the designer, before he can add to his store of knowledge a sufficient familiarity with detail pattern and foundry practice, that many will be prevented either by the press of production or by mental and physical inertia from doing the necessary work.

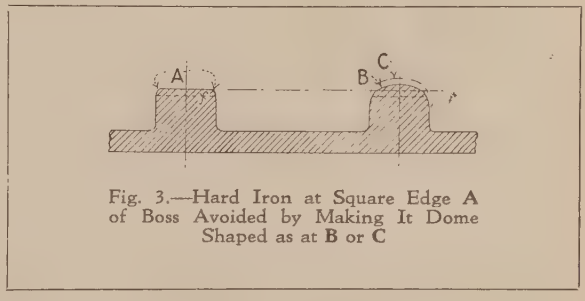

Fig. 3.—Hard Iron at Square Edge A of Boss Avoided by Making It Dome Shaped as at **B** or **C**

This brings us logically to a consideration of the responsibility of the executive. The executive who senses the importance of modifying designs and patterns in a way that will increase the margin of safety in the foundry, and then fails to create a setting whereby his designers are permitted or forced, as the case may be, to take the necessary corrective measures, has only himself to blame for the continued high machining costs and loss of production that are properly traceable to white iron. It is, of course, impossible to correct all going designs overnight, but it would be an economic crime to permit the designs of new engines to go out which are doomed by improper design to become addicts to the white iron habit.

A word of caution to the foundry would then be that when every possible precaution has been embodied in the design, bad foundry practices may still produce white iron. When a white iron epidemic occurs, the foundry therefore cannot safely conclude that it is all the designer's fault. On the other hand the entire responsibility does not necessarily rest on the foundry.

Furthermore it is a foregone conclusion that as soon as the designer finds that he is no longer troubled with white iron, he will inevitably stiffen up his specifications to secure a still stronger and more wear resistant iron. Therefore, the foundry must keep on its toes to be ready to fulfill this coming demand.

Most of these comments have been directed specifically to cylinder heads and blocks, because of the great tonnages and consequent seriousness of the situation when

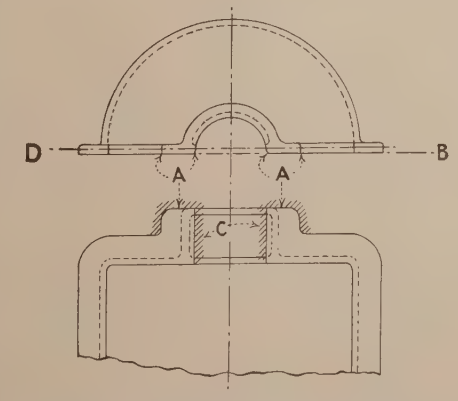

Fig. 2.—Moving Parting Line from **B** to **D** Will Avoid White Iron at Fins Shown by Hatchings at **C**

trouble does occur. Everything that has been said applies equally in principle to all similar castings made of gray iron.

Recapitulation

1. White iron edges on finished surfaces are responsible for loss of production and wasted money, much of which is preventable.

2. Either molybdenum or nickel alloyed into the iron tend to combat white iron edges.

3. High chromium, low silicon, low total carbon, cold poured metal and wet sand, also tend to produce white iron edges.

4. Fins, on the rough castings, which are found on the edges in question are a prolific cause for white iron edges when the items listed above drift toward the danger zone.

5. A fundamental reduction of white iron edges can be made by modifying the designs and patterns in a way that will remove fins from critical locations. Improvements made in this way will remain improvements once the essential changes have been made, until the requirements are made more drastic.

6. The designer has a heavy share of responsibility for white iron edges because he has pushed the foundry closer to the limit of possibility in the production of uniformly machinable iron.

7. The ultimate responsibility for continuing or correcting the present situation caused by white iron is squarely on the shoulders of the executive.

8. The foundry responsibility is not radically changed by the points that have been brought out.

9. The development of improved iron is sure to continue and the foundry cannot slacken their practices after present designs are made more adaptable to the production of rough castings free from white iron.

Zinc Oxide in Grease Solves Obscure Corrosion Problem

CONSIDERABLE attention was given by the English engineering press two years ago to a toothless gear known as the Keenok pinion. It consists of a steel tire and a central hub, both of which are serrated to receive between them a number of steel rollers. End plates are attached to the central member to retain the rollers and the tire in position. The tire has a freedom of 0.001 or 0.002 in. on the ring of rollers, and the central hub is keyed to a shaft.

A simple application of the pinion is for the transmission of power between two parallel shafts. The tire presses against a plain collar on the second shaft. The pressure between the two sets the tire slightly eccentric to its inner member, and the tangential force received by the rollers from the tire causes the rollers on the contact side of the pinion to move slightly up the slopes of the serrations. By so doing, they act to restore the tire to concentricity with the inner member and therefore to increase the contact pressure between the tire and the other shaft. The greater the tangential force applied to the tire, and therefore to the rollers, the farther will the rollers climb up the serrations, and consequently the greater will be the contact pressure between the tire and the driving shaft. At all loadings no slip occurs, even when the whole gear case is filled with lubricant.

In practice it was found that ruinous corrosion was set up in the device, amounting to 1/64 in. in 300 hr., even on parts which were not subjected to abrasion. According to *Engineer*, Sept. 27, more than 50 different types of lubricant were tried, both acid and alkaline in reaction; even when the gear was run dry in an enamelled case the rapid corrosion occurred. It was finally decided that the local stresses, rapidly varying in intensity, set up sizable potential differences and induced electrolytic corrosion. It ought then to be possible, by mixing some substance with the lubricant, to convert the harmful corrosion of the electrolytic action into a beneficial protective effect.

The substance eventually chosen was zinc oxide. When small quantities of this oxide were mixed with the lubricant little or no benefit was noticed. When, however, the amount added was some 50 per cent or more of the weight of the oil, it was found that all corrosion troubles disappeared and that the parts, instead of corroding, became coated with an extremely thin and apparently permanent film of metallic zinc. Examination at the National Physical Laboratory showed that the deposit is metallic zinc; the film has a thickness of 0.0004 mm. or less, that is to say, less than the average wave length of white light, and therefore invisible beneath the microscope when viewed in section. The film is speedily established, and once established does not grow beyond a limiting thickness. That its thickness does not increase indefinitely is proved by the fact that the device shows no signs of jambing or seizing after it has been run for many hours in the presence of the zinc-depositing lubricant.

Corrosion of this kind has been noted before and has been called "mechanical corrosion." It occurs in high-speed ball or roller bearings or chain drives, and the new lubricant has a field of application in those directions.

"Featherweight" Concrete Roof Tile Is Cellular

A lightweight concrete roof tile has been put on a quantity production basis by the Federal Cement Tile Co., 608 South Dearborn Street, Chicago. The tile, which is made of a material known as Haydite, is one-third lighter than ordinary concrete tile, made from sand and gravel, or stone. A sand concrete slab of channel form, say 2 ft. wide by 6 ft. long, weighs 15 lb. per sq. ft., compared with 10 lb. per sq. ft. for the Haydite tile.

The lightweight tile is recommended as a means of saving steel in roof construction. It requires, it is said, no heavier steel design than any other form of roof covering, at the same time offering the advantages of permanence, fire-safety and absence of maintenance.

Haydite is made from shale, ground and burned at a temperature of 2000 deg. Fahr. in rotary kilns similar to those used in making Portland cement. During the burning, oxidation of the carbon content forms gases, which cause the shale to expand into an inert, light-weight cellular structure. This material, a mass of trapped air cells, the walls of which are thoroughly vitrified fused shale, is crushed, screened and graded and used as an aggregate for concrete instead of sand and gravel. The cellular structure of the tile made from Haydite not only makes for lightness, but also gives the slabs a definite insulating value, it is stated.

Since its foundation in 1921 the British Cast-Iron Research Association has made considerable progress. Among other things a heat-resisting cast-iron has been discovered which has given remarkable results when repeatedly heated in the presence of moist carbon dioxide at temperatures ranging from 600 deg. C. to 1000 deg. C. The results are stated to have radically modified existing views with regard to the effect of composition on growth.

Good Business Volume in Prospect for 1930

Early Recovery from Stock Market Crash Seems Assured, But Forcing of Activity Might Bring New Setback

BY VIRGIL JORDAN

I DO not believe that any specific forecast of general business conditions in 1930 can be scientifically justifiable or indeed quite honest at this time. The evidence upon which to base any such forecast is confused, fragmentary and uncertain. Most of the things that are being said about current conditions and prospective programs, whether for better or for worse, cannot be taken at their face value. The true situation is still somewhat distorted by exaggerated anxiety, due to individual losses, and by excessive optimism colored by a political purpose.

Within a month or six weeks we shall be able to judge more clearly and fairly how much truth there is in the assertions and promises now being made. In the meantime I think it is wisest to disregard them and to guide business and financial policies conservatively and cautiously in the light of those fundamental factors in the situation, both known and unknown, which are likely in view of past experience to determine the general business outlook for next year.

Danger in Forcing a Boom

THE balance of probabilities is certainly in favor of a fairly quick recovery and a moderately good year in most lines of business in 1930. The underlying forces are all set in the direction of expansion, and it is quite possible that they may be so strong, so quickly brought into action and so effective that the basis for a good-sized boom may be laid early next year. This, I think, is a real danger and would be a most unfortunate consequence of the current tendency to force business expansion.

Too early and too great an expansion would rest upon a weak and insecure foundation and would invite an early relapse in the stock market and in general business which would destroy confidence far more seriously than the events of the past few months and would be far more difficult to correct. Such a boom would quickly become a boomerang and hopelessly discredit those who fostered it.

It must be remembered that the present recession is in large part a reaction to the boom conditions that developed in the latter part of 1928 and came to their climax in the first half of 1929. The 1929 bull market was built upon that boom, and its collapse was in larger part merely a reflection of the readjustment of business to a more normal rate of growth.

¶ Fluctuations in business volume have been progressively smaller since 1921.

* * *

¶ Current recession promises to be short-lived, and general business in 1930 should average somewhat above normal.

* * *

¶ Loss of general purchasing power cannot be estimated, and statistics on inventories are incomplete.

* * *

¶ Stocks of farm products are large, and consumer inventories are an unknown quantity.

* * *

¶ It is fairly certain that current readjustment will not be more severe than those of 1924 and 1927.

* * *

¶ But an artificial bull movement, induced by easy money and boom propaganda, might result in a new and more serious business setback.

I am inclined to think that the present level of general business activity, though somewhat below last year at this time, and far below the level in the first half of 1929, is still little, if any, below normal for the season, if by "normal" we mean the level that would be reached in the regular average year-to-year growth of general trade, and if by "season" we mean the time when usually in the past there has been a slackening of activity. In some industries and lines of trade there may be new normals and marked changes in season, but there is no evidence that such changes have affected the course of the total volume of trade from year to year.

Present Situation Resembles That of 1927

IN the fall of 1927, at the annual meeting of the Railway Business Association and elsewhere, I made a definite prediction of the 1928-29 boom period. It seems to me now that the present situation closely resembles that which developed in the last half of 1927 following the business expansion in 1926. That expansion was less marked than the 1923 boom and the recession which followed it was more mild than that which took place in 1924. Both these in turn were less severe than the boom of 1919-20 and the succeeding depression of 1920-21.

We can perhaps secure a better idea of the present situation and outlook if we compare the degree of fluctuation in general business in these three successive periods of readjustment from excessive business and financial expansion — readjustments which took place at approximately three-year intervals and of progressively diminishing severity. The following quotation from an article by the writer in *Business Week* for Nov. 27 summarizes these comparisons, based upon the comprehensive and careful measurements of industrial and trade activity by the Federal Reserve Bank of New York:

Business Fluctuations Narrowing

"In each of these recessions general productive activity, as measured by manufacturing, mineral and agricultural output, building construction and employment, has shown the greatest fluctuation, next to financial activity, falling earlier and further and rising sooner and higher than any other measure of business except financial activity. But since the war these movements have never been very wide. The highest was about 16 per cent above normal in January, 1920, the lowest 23 per cent below for one month, February, in 1921. In 1924 it fell, at the worst, no more than 7 per cent below the normal line in June; and in 1927 was below normal by only 1 per cent in one month, November. The average for 1921 was only 15 per cent below normal; for 1924, 3 per cent above; and for 1927, 5 per cent above.

"Primary distribution, as measured by carloadings, wholesale trade and foreign trade, has fluctuated even less widely in these recession years, in 1921 reaching only 10 per cent below normal in September; in 1924, 5 per cent below in June and July. In 1927 it was above normal throughout the year except in December, when it fell 6 per cent below. The average for

1921 was only 3 per cent below normal; for 1924, 1 per cent above; for 1927, 3 per cent above.

"Distribution to the consumer, as measured by retail trade, advertising, life insurance sales, is steadiest of all. It has fallen no more than 8 per cent below normal in any month in the past 10 years—once in December, 1920. The average for the depression year 1921 was only 3 per cent below; in 1924 it was 1 per cent above; in 1927, 4 per cent above.

"The New York Federal Reserve Bank combines these and other measures of general business, such as postal receipts, telephone and telegraph business, power production, incorporations, real estate transfers and check payments in and outside of New York, into an index of the total volume of trade for the country as a whole. At no time in the past 10 years has this index fallen more than 9 per cent below normal—except in two months, February and March, 1921. The average for 1921 was 8 per cent below; for 1924, 2 per cent above; for 1927, 7 per cent above. Even at the peaks of business activity it has not risen more than 12 per cent above normal.

"If the measures of primary distribution and distribution to the consumer are combined with the general business indicators, and financial activity excluded, the fluctuations in general trade in recession periods are even smaller still. They have never been more than 7 per cent below or 10 per cent above normal in the past decade. In 1921 this measure of general trade averaged only 4 per cent below normal; in 1924, 1 per cent above; in 1927, 4 per cent above."

Nothing Like 1920-1921 Recession in Sight

THESE comparisons seem to be extremely important in judging the probable extent and duration of the present movement. Measured in any terms the 1920-21 recession was the most severe of which we have any record, and I believe it is entirely improbable that anything resembling it can take place at this time or under present conditions. The difference between these conditions and those which existed at that time—notably the absence of anything approaching the world-wide credit and commercial paralysis that existed in 1921, and the absence of large inventories in the hands of producers and dealers, or of drastic commodity price inflation—have been sufficiently emphasized and need not be further stressed. But even under those conditions it should be noted that the fluctuations in the general volume of trade were relatively small, and only in a few months did it fall markedly below normal.

There may be certain new and unknown factors in the present situation which destroy or modify the force of these comparisons, but I think that on the whole they are more likely to be favorable than unfavorable. We do not know, and have no means of measuring, the actual amount of loss in the stock market crash, or the extent to which it has affected general purchasing power, and I believe that all estimates of this kind are mere blather. Nor, it should be remembered, do we know how much further it still has to go.

Status of Consumer Inventories Uncertain

WE cannot be sure, moreover, that there are really no large inventories of some kind somewhere to be liquidated. Our statistics of stocks are fragmentary. We do know that stocks of raw materials in some lines, including particularly agricultural commodities that are being held on credit with the aid of the Farm Board, are quite large; and we still have to learn whether the new kind of inventories, very large in amount, in the hands of consumers can be successfully carried in face of loss of purchasing power and liquidated out of new income without loss of markets for new products. Finally, we are not altogether certain about the position of many of the smaller units in our banking system, or the extent to which their assets and those of savings banks, building and loan associations and life insurance companies have been frozen, or their ability to expand loans reduced, by the emergency aid they rendered to their customers, depositors, members or policyholders who were caught in the crash.

It is clear, however, that it is individuals rather than business or business organizations as a whole that have been involved in the collapse; that our banking reserves are remarkably strong, thanks to the far-sighted policy of the Federal Reserve authorities and most of the member banks; and that the world-wide credit tension has been eased with unusual speed, so that there is every prospect of there being enough credit available to carry business over a slack period without great strain.

Overstimulation Would Impede Recovery

IN general, therefore, while the business boom conditions and the financial inflation that preceded this recession have doubtless been more excessive than any we have seen since the war, it is fairly certain that the readjustment will not be more severe than those we experienced in 1924 and 1927. I am inclined to think that, so far as can now be observed, it will be less severe than in 1924, and not much if any more than in 1927. At the very worst that can now be foreseen, general business in 1930 will still average somewhat above normal, though it may fall slightly below in the next two months.

The rapid easing in money rates, which will probably bring the rediscount rate down to 4 per cent by the end of the year, combined with the unnecessary boom propaganda now under way, moves me again to warn against the danger of inducing an artificial and unsoundly supported bull movement, either in the stock market or in general business next year. The stock averages have already risen nearly 50 points since the lows of Nov. 13. If they are pushed up further at this rate during the next few months, a general relapse is certain before the middle of 1930, and normal business recovery will suffer a serious setback. The normal course of security prices for the next six months should be irregularly and gradually downward until levels approximating those of late 1926 are reached. Upon such a basis a normal recovery and expansion of business in 1930 and 1931 could be looked for.

Machinery Manufacturers' Rules of Practice

WASHINGTON, Nov. 26. — Eleven rules of business practice adopted by the manufacturers of concrete mixers and pavers at their trade practice conference held with the Federal Trade Commission last September have been approved by the commission as applying to unfair methods of competition. Eight other rules adopted by the industry were accepted by the commission in the class known as "expressions of the trade."

The first group of rules covers such practices as representation by a manufacturer that the capacity of any concrete mixer or paver is greater or less than its published rated capacity; circulation by a manufacturer of false statements concerning production, ability or financial standing of his company, or of a competitor; false statements regarding size, weight, design or performance of his machines or of a competitor's machine; enticing employees of a competitor to violate their contracts of employment; inducing breach of contract; payment of secret rebates; discrimination in price by selling to favored customers a new-model concrete mixer or paver as an old model or repossessed or rebuilt machine; and selling of concrete mixers and pavers without profit or below cost for the purpose of injuring a competitor.

The second group of rules accepted concerns such subjects as published prices; allowance of special price; uniform cost accounting; quotations f.o.b.; and creation of a committee on trade practices to investigate and determine whether the resolutions adopted are being observed.

Purchase of the Chicago Railway Signal & Supply Co., a subsidiary of the Illinois Iron & Bolt Co., Carpentersville, Ill., by the Railroad Supply Co., Chicago, has been announced. The Chicago Railway Signal & Supply Co. was incorporated as a subsidiary of the Illinois Iron & Bolt Co. in 1914, and has been in continuous operation since that time, producing a line of railroad crossing signal devices, train signals and general railway supplies. E. H. Bell is president and Paul W. Kohnen is secretary of the Railroad Supply Co.

National Founders Have Varied Program

Improved Equipment and Production Methods, Selling Methods, Analysis of Human Material in the Plant and Other Subjects Discussed

WITH a varied program, which included such important topics as improved foundry equipment and methods, the human element in production as scientifically analyzed, the relation of business facts to the stability of business, the current financial situation and modern selling methods, the thirty-third annual convention of the National Founders' Association, at the Hotel Astor, New York, Nov. 20 and 21, contained a great deal of informative value for manufacturers in all metal-working lines.

This convention marked the end of the first year of the new policy inaugurated by the association at its 1928 convention, when it abandoned its custom of long standing of employing a paid president. Col. Thomas S. Hammond of Harvey, Ill., who is president of the Whiting Co., was unanimously reelected by the association as a recognition of his work in steering the association on its new course.

Colonel Hammond, in his presidential address, said that the first year under the new régime had been successful financially and otherwise. For the first time in many years, the income from memberships was more than sufficient to pay the running expenses, and a surplus for the reserve fund was left over.

Although there were 44 resignations from membership, the association ended the year with more member plants and a greater reportable income than it had at the beginning of the year. Some of the loss in membership was due to consolidations, financial difficulties and other unavoidable causes.

Labor Troubles at Minimum

During the year strike support was required by only five members. In each of the labor controversies the question at issue was the closed shop, neither wages nor hours being involved.

Colonel Hammond stressed the importance of the work being done by the administrative staff in such lines as accident prevention, study of manufacturing costs, apprentice education, legislation and in spreading the gospel of the open shop.

He urged the need of further work in building up the membership lists, and this thought was amplified in the report later submitted by the membership committee, which launched a membership campaign that will enlist the services of every present member in raising the total membership during the coming year.

The association, in addition to reelecting Colonel Hammond president, selected S. Wells Utley, Detroit Steel Castings Co., Detroit, and former president of the American Foundrymen's Association, as vice-president, and reelected J. M. Taylor secretary. A. E. McClintock, whose office is appointive, remains as commissioner. District committeemen elected are listed in an adjoining column.

Resolutions were adopted in memory of O. P. Briggs, for many years a member of the administrative council and up to his death an honorary member of the council, and for Mathew Griswold, who had served as vice-president and as a member of the council.

Opposes Anti-Injunction Bill

Walter Gordon Merritt, associate counsel, League for Industrial Rights, discussed the present status of labor legislation, dwelling principally on the anti-injunction bill of Senator Shipstead of Minnesota, which probably will come before Congress at its next regular session.

"The bill now being proposed," he said, "ignores the principle that combined economic power may be oppressively used as against the individual and as against society. It proposes to put beyond injunctive restraint the right of organized labor to engage in strikes, direct and sympathetic, and in boycotts, primary and secondary, in private industries or on railroads or public utilities. Neither could injunctions issue against mass picketing or intimidation. Only violence and fraud could be enjoined, and then only under impracticable restrictions.

"A new law of agency is also to be set up, applicable to labor unions alone, which would relieve members from responsibility for their agents' acts, except where they expressly authorized or ratified them. Every other member of society would be subject to the rule heretofore laid down that a principal is bound by the acts of his agent within the scope of his employment regardless of whether the specified acts were authorized or ratified.

"This proposed bill, in effect, would give legal sanction to combinations to engage in strikes, secondary boycotts, and mass picketing against a union employer who merely refused to consent to a union's cancellation of its own agreement. It would also place beyond injunction restraint railroad strikes to prevent the hauling of non-union products by non-union men, and would encourage sympathetic strikes on railroads to assist the United Mine Workers of America in depriving the public of coal in times of coal strikes. These are but illustrations of the character of combinations which would be placed beyond injunctive restraint were this bill to become law.

"The inherent vice of the bill is the fact that it legalizes the use of combined economic power for any and all purposes, however oppressive, anti-social or unholy, instead of attempting to distinguish between the legitimate and illegitimate uses of combined economic power. In this respect the bill attempts to make legal favorites of the activities of labor unions by the establishment of fundamental principles applicable to no other section of society."

Facts Help to Stabilize Business

IN an address on "Business Policies and Business Information," Roland P. Falkner, chief statistician, National Industrial Conference Board, referred to the recent collapse of stock values by saying that "many who were playing the game in Wall Street were living in a fool's paradise in which rumor, hope and an exaggerated optimism took the place of business judgment." He added that optimism based on dreams and untempered by business judgment "pushes its victims into the pit.

"In contrast with the wild excesses of the stock market," Mr. Falkner said, "industry and commerce in the United States have in the last few years moved along steadily at an even gait, expanding with the normal growth of population and demand. The general belief at the present time is that the spasm in the stock market will prove to be more or less of a local convulsion, with, at the worst, only a comparatively slight influence upon the development of trade and industry. If this be true, we shall see possibly no halt to industrial progress but only, and for a comparatively brief time, a slight slackening in the rate of its advance.

"It would be idle to attempt to analyze all the causes of the marked industrial and commercial stability which has characterized the entire era since 1921. Many and varied have been the explanations which have been offered for this continued prosperity, and assuming that each of them has

more or less merit, it would be an interminable, if not an impossible, task to weigh the exact importance of each.

"Among them, however, one thing stands out preeminent, namely, the vast increase in business information which is available for those who know how to use it and which, as we have every evidence, industry and commerce are in fact using more and more from day to day in the conduct of affairs.

"The facts upon which business policies rest today may be classed as fundamental and current. The fact-finding and fact-recording machinery in each of these fields grows almost daily in strength and efficiency.

"The business structure today is vastly different from what it was a generation ago. Its units have become much larger, their fields of operation more extensive. The privacy and secrecy which surrounded every business enterprise 50 years ago have almost entirely disappeared. Whether the business men of today are superior in their energy or intellect to those of 50 years ago is a wholly idle question. It is enough to say that they are different and live and work in an altogether different environment. Business experience in those days was a private possession and not publicly advertised.

"Today, through the multiplication of business journals, the alert business man can profit not only by his own experience but from that of hundreds of others. He is no longer an isolated factor in the business world, but realizes instead that he is part of an army marching toward the same end, animated by a common purpose, and, as one of the leaders, fully conversant with the purposes he has to pursue, the problems he has to meet and the experience which has been gained toward the solution."

Business Data Are Voluminous

Mr. Falkner spoke of the vast development of business literature in the past few decades, not only in the trade publications but in books of varied descriptions bearing on the facts of business. Trade associations and research bodies and the universities have added greatly to the available supply of facts which affect business operations. In addition, various bureaus of the Government have expanded their work in this direction in recent years. Current information on business is being supplied by business publications in volume and thoroughness never before reached, said Mr. Falkner.

"There is no longer any need," he added, "for business to rest upon rumor, surmise or conjecture. The facts are available for all who are willing to seek them and able to use them. Does not the experience of the past few years demonstrate beyond contradiction that business facts judiciously used will guide industry and commerce into continued prosperity, and may we not hope that with the spread of this information, and with its increased use, the shocks to business which are the bane of industrial activity may be mitigated and almost entirely done away with?"

Frank F. Winans of the stock brokerage firm of Baker, Winans & Harden, New York, discussed the financial situation leading up to the recent stock market collapse. He brought up the question whether present conditions would bring to an end the era of business consolidations. His view was that the short-range outlook was for a

checking of such activities, but that ultimately the tendency to work out economic improvements in various lines of business would reassert itself.

S. Wells Utley, Detroit Steel Castings Co. Detroit, who was one of a party of American foundrymen who visited the International Foundrymen's Congress in London, England, last summer, gave an entertaining description of the delegation's tour through England and Scotland, and drew some comparisons of underlying industrial conditions in Great Britain and the United States. S. T. Johnston of the S. Obermayer Co., Chicago, who headed the American delegation, and Fred Erb, president, American Foundrymen's Association, spoke briefly.

Modern Equipment Doubles Output

SEVEN years development in the foundry of the Wilson Foundry & Machine Co., Pontiac, Mich., was described by Henry M. Lane, foundry engineer, after a brief introduction by D. R. Wilson, head of the company and chairman of the association's committee on foundry methods.

Mr. Lane recalled that a pictorial description of this foundry had been presented to the National Founders' Association seven years ago, and he outlined the changes and improvements which had been made in equipment and methods in the interim.

The original foundry occupied 21,350 sq. ft. of floor space. Seven years ago it had 304,150 sq. ft., and since then only 5 per cent in floor space has been added, but the output has been doubled. Sixty per cent of the output is obtained from 30 per cent of the floor space.

In 1922 the foundry was producing 10 cylinders per man per day, and now the output is 35 cylinders per man per day. A good part of the present output is 6-cylinder work, whereas formerly it was 4-cylinder.

The cost of molding sand seven years ago was 72c.; now it is 52c. The saving has been effected by utilization of waste core sand. There is a total saving from this item of $22,000 a year, and storage space occupied by 700 carloads of sand is also utilized for other purposes.

Seven years ago the output of flywheels was 73 per man per day; now it is 120. The charging cost seven years ago was $1.61 a ton; now it is 90c. There has also been a gain of 3.61 per cent in the tonnage of good castings turned out, and a reduction in scrap from 3.58 per cent to 1.49 per cent.

These results have been accomplished by the installation of sand handling equipment, mold handling equipment, shake-out equipment and various other appliances. In the core room the increased output has been accomplished by a better arrangement of core assembly conveyors and a relatively small increase in the area of the core room; only one double battery of oil-fired ovens containing 20 ovens has been added.

Lantern slides showing the new equipment were presented.

Effects of the Human Factor on Output

Elton Mayo, professor of industrial research, Graduate School of Business Administration, Harvard University, gave an interesting account, illustrated by charts, of experiments conducted under his supervision to determine the effects of mental and physical fatigue and other factors on production.

He first told of experiments conducted with about a dozen men who ran at a rate of about six miles an hour for 20 minutes on a treadmill, and his chart showed the physical changes, determined by medical examination before and after, which had occurred in each as a result of this exertion.

This prefaced a more detailed explanation of the results of a two and a half year test made in a large industrial plant, where two groups of five girls each were subjected to constant study of all of the elements which affected their production either adversely or favorably.

Some of the observations which resulted from this intensive study were illuminating as to the decided effect of working conditions, daily habits of living, mental attitude and other influences on productiveness.

The girls selected were in good health and normal in every way, as determined by physical examinations. Each group was placed in a room. The purposes of the experiments were carefully explained to them, but they were urged to make no special effort to attain high production but to work in their normal manner.

Results of Changes in Working and Outside Conditions

Working conditions and outside conditions were changed at various periods to watch their effect. For example, it was found that production was higher when the girls were given a 15-min. rest period morning and afternoon. When a slight slump in production occurring just before the noon hour was noted, the girls were supplied with a light lunch during their morning rest period, and this had the effect of keeping the production curve straight up to the noon recess. The conclusion was that some of the girls ate light breakfasts and hunger, as noon hour approached, slowed up their work.

Experiments were conducted as to the results of a five-day week. It was found that the daily rate was higher, though the weekly rate at first fell off. Later both the daily rate and the weekly rate were increased, developing the conclusion that a five-day

week was not a destroyer of production totals.

During the period of the test the girls were examined by physicians at regular intervals, and it was found that the general health of the group improved, they accomplished their work with diminishing effort as time went on and there was a steady increase in production. The gain for the girl who was the most rapid at the beginning was 30 per cent and the slowest girl made a gain of 50 per cent in this time.

The experiments determined that certain types of supervision were inimical to efficient work. It was found that when a girl was "called down" for low production on a preceding day her output for the day of the "call down" also suffered. This discovery resulted in a new type of supervision, in which there is "no ragging," as Professor Mayo put it.

Effects of mental attitude were noticeable in the test. When one girl's work dropped off perceptibly, it was found that she was nervous and apprehensive regarding certain conditions at home. When a change came about in her mental attitude her work immediately improved.

It was found that the wage incentive was less of a factor in keeping up production than improvement in general working conditions. Outside influences, such as hours of sleep, were found to have a considerable effect. Experiments were conducted as to the results when the girls had sleep ranging from six to nine hours. Starting at six hours, the production curve went upward with each hour of sleep nightly that was added. With nine hours, for example, the results were better than when the girls got eight hours.

However, the most apparent lesson of all, Professor Mayo said, was that the method of supervision has a greater influence than was realized. As a result of the test, the company in whose plant it was made has changed its whole method of supervision. He emphasized the point that supervision must be based on knowledge of the human material a plant is handling.

Important Elements in Salesmanship

R. C. Borden and Alvin C. Busse, professors of public speaking, New York University, whose subject was "The Business of Selling," gave a convincing demonstration of good and bad salesmanship. Their talk, which was punctuated with selling impersonations presented with dramatic effectiveness, was based on a survey of seven and a half years which they conducted with the cooperation of some of the largest New York corporations.

Professor Borden said that he and Professor Busse were permitted to sit in the offices of buyers and study the various types of sales presentations. From this long and intensive study they prepared 15,000 case reports. An analysis and digest of this large volume of actual experiences brought out six important points in successful selling, which Professor Borden said are so obvious that it is surprising how often they are overlooked in actual practice.

Professor Borden said that the best "conversational strategy" would not overcome any lack of knowledge by the salesman of his goods and his market, but, assuming that the salesman is well versed in these essentials, his technique of selling could be greatly improved if he would heed these six major points:

1. Watch out you do not do too much of the talking yourself. If the prospect is earnest in raising an objection, he wants to talk, too. Be a good listener first and a good talker second.

2. Watch out that you never interrupt a prospect when he has only started to explain some objection. This causes irritation.

3. Watch out you do not slip into an argumentative manner that becomes almost belligerent.

4. Inquire first; attack afterward. Ask for more details of the buyer's objection, or for any other objections he may have. Let the buyer disarm himself by stating all of his objections without hindrance.

5. When you begin your sales attack, repeat your prospect's objections in your own words. If you do not, he is likely to feel that you have not understood his objections. Show a full and sympathetic comprehension of the buyer's point of view.

6. After the preliminary phase, base your concluding attack on one key issue, not two or three. The key issue will manifest itself in the discussion. Don't digress. Subordinate all other issues to the one you feel is uppermost in the buyer's mind.

Summing up, Professor Borden quoted Confucius that "men don't trip on mountains, they trip on molehills," and said that many possible sales were ruined because of lack of attention to the seemingly trivial things in the sales approach.

Metal Workers Form Association

Metal Stamping Shops, Tool and Die Makers in New York District Organize and Elect Board of Governors

METAL stamping manufacturers, tool and die makers of the metropolitan district, New York, met Nov. 20 at 71 West Twenty-third Street, New York, to organize a trade association. By-laws, based on the procedure recommended by the Department of Commerce, were passed and the name "Metal Trades Association of New York" was adopted by the meeting.

Membership in the association is limited to manufacturers in the New York metropolitan district and vicinity. To be eligible, a person, firm, or corporation must be engaged in the manufacture by contract or job order of pressed metal goods, dies, tools, machinery or kindred lines.

The meeting was the third organization meeting to be held, but the first at which definite action could be taken toward forming the association. A brief address was made by Fletcher D. Dodge, secretary, Toy Manufacturers of the United States, outlining the activities and value to the trade of an association.

As a questionnaire sent out by the committee of organization had resulted in a large proportion of requests for information on uniform cost systems and contracts, Prof. DeWitt C. Eggleston of the accounting department of the College of the City of New York, had been invited to address the meeting and read a paper on the necessity of establishing all the factors entering into the cost of operation of a plant as a means of profitably bidding for business.

While the by-laws adopted at the meeting call for a board of nine governors in three groups, elected for one, two and three years each, it was decided to elect only the three governors in the one-year group until the association had increased its membership. The organization committee of three was unanimously elected to the governing board. They are Adolph Hopp, Mutual Metal Craft Co., 390 Second Avenue, Felix Wyner, Wyner Machine Works, 251 Third Avenue, and Ernest Furst, Eureka Tinware Mfg. Co., 139 West Twentieth Street, all in New York.

Companies which have signified their intention of becoming members include the following in New York: H. K. Lorentzen, Tudor Metal Products Co., Gustav Danzis Co., Inc., Wyner Machine Works, Novelty Wire & Metal Works, Triangle Mechanical Laboratories, Ben-Moore Mfg. Co., Selco Tool & Die Co., and Mutual Metal Craft Co.; in Brooklyn, the Du Plus Co., Century Machine & Tool Works and the Woodhaven Metal Stamping Co.

Waterways Movement of Steel Declines

Movement of iron and steel products on the Ohio River during October amounted to 119,129 net tons, according to figures of the United States Engineers' Office, Pittsburgh. This compares with 150,163 tons in September, and with 130,808 tons in October, 1928.

Monongahela River commerce in iron and steel in October totaled 119,380 tons, compared with 135,773 tons in the preceding month and with 131,281 tons in October, 1928. No iron and steel was moved on the Allegheny River last month.

Business Leaders Promise Aid

President Hoover's Conferences Expected to Result in Release of Building Projects and Further Railroad Equipment Orders—Henry Ford Raises Wages

WASHINGTON, Nov. 26.—With the next to the last of the series of White House business conferences held yesterday with agricultural interests, President Hoover has practically completed the cycle for the maintenance of industry and employment through the support of the entire country. Railroad, financial, industrial, construction, labor and agricultural interests, State governors and the public generally have pledged their cooperation, and large programs of expansion and replacements have been announced which promise continued business activity and employment. The White House conference with representatives of public utilities has been indefinitely postponed.

With a view to crystallizing the plans, Chairman Julius Barnes of the Chamber of Commerce of the United States, at the suggestion of President Hoover, has called a meeting for Dec. 5 at the chamber of important industrial and trade groups for the organization of a business council to continue the study of business conditions. The conference, of 150 to 250, will be asked to make recommendations respecting the personnel of the executive committee which the chamber has been asked to create and which was proposed at the White House meeting of the industrial group held on Thursday of last week. Among those attending this conference were President E. G. Grace of the Bethlehem Steel Corporation; Myron C. Taylor, chairman, finance committee, United States Steel Corporation; E. J. Kulas, Otis Steel Co., and George Laughlin, Jones & Laughlin Steel Corporation.

President to Open Conference

The conference at the Chamber of Commerce of the United States will be opened by President Hoover, and in telegraphic invitations to trade associations representing basic industries and to individuals, President William Butterworth and Chairman Barnes announced it was proposed to consider voluntary and cooperative action between various lines of industry and between business and government agencies in aid of the preservation of the recent high level of business activity. It was stated that President Hoover would open the conference and that from it may grow some form of business council for continuing action. The trade associations were requested to send their strongest leaders.

It was at the industrial group conference that it was agreed a definite organization should be established through a committee representing different industries and sections of the business community for the purpose of carrying out the program of President Hoover. Members of the group promise to act as a temporary advisory committee with Secretary of Commerce R. P. Lamont, who was authorized to add to the committee, and Mr. Barnes was asked to create an executive committee from members of the group. The industrial group conference had in turn followed the suggestion at the initial White House business conference, held with railroad executives, that similar conferences should be called to the end that some method of coordination of their activities should be developed. The subsequent conferences pursued this course.

President's Prosperity Program

INDUSTRIAL and trade groups to organize council to cooperate with Government in study of business conditions at business meeting in Washington, Dec. 5.

President Hoover receives widespread response from business interests and officials throughout country to aid in continuing industrial activity and employment.

Federal, State and municipal road building and construction programs indicate outlay of more than $2,200,000,000 next year.

Chairman Julius Barnes, Chamber of Commerce of United States, speaking at suggestion of President Hoover, tells radio audience of United States details of White House conference with industrial leaders, reflecting enormous projects of expansion and improvements.

Among other things, Mr. Barnes said:

That steel industry, through its leaders, announced $300,000,000 in new construction and in industrial improvements by one great corporation.

That automobile manufacturers told the President that orders have picked up again.

That Clarence M. Woolley, American Radiator Co., said it has been estimated that 1,000,000 homes will be modernized in 1930 to the extent of $2,000 each.

That public utilities propose to spend $1,000,000,000 in their 1930 improvement program.

Expansion Programs Planned

In announcing the result of his conference with 22 industrial and business leaders on Thursday of last week, President Hoover said it was the unanimous opinion that there was no reason why business should not be carried on as usual and that construction work should be expanded in every prudent direction, both public and private, to cover any slack of unemployment. The President said that, in the steel industry, it was stated that large construction programs would be undertaken for replacement of obsolete plants. The steel men present would not comment on the conference, leaving the statement to the President, but it understood that the programs they have in mind involve heavy construction of new units as well as large replacements. Interestingly enough, it was pointed out that steel manufacturers had been held back from expanding building programs partially because of the lack of the supplies of their own material which they were producing in such large volume for other consumers.

The President's statement regarding the industrial conference said that it was found that a preliminary examination of a number of industries indicated that construction activities can in 1930 be expanded even over 1929. The telephone company was said to be preparing an expansion program over that of 1929 which involved an outlay of $600,000,000, and that power, gas and other public utilities could undertake a program in excess of that of 1929. This group arranged for a meeting in New York today with a view to announcing its program.

Leaders in the automobile industry told the President that while 1929 production was unusually large due to the carry-over of a great deal of unfinished business from the previous year, they confidently expected that except for this excessive margin the industry should quickly return to its normal production. It was also held that an indirect but substantial contribution could be made to the extension of credit for local building purposes and for conduct of small business, if the banks would freely avail themselves of the rediscount privilege offered by the Federal Reserve banks.

Ford Announces Wage Increase

The industrial group meeting is known to have emphasized the necessity of maintaining wages and em-

ployment throughout industry as a means of keeping up purchasing power and therefore the absorption of goods, points which are understood to reflect the views of President Hoover. The announcement made an hour after this conference by Henry Ford, who was one of the attendants, that he was going to grant a general percentage increase in wages, created a stir because it was unexpected. Mr. Ford declared in a statement, made previous to and apart from the Ford Motor Co. wage increase announcement, that wages should be increased in order to increase purchasing power, and took the view that the decline in business was not due to the collapse in the stock market but rather was the result of exhaustion of buying power of the people, the solution of which he held was in increased wages. He said that there had been a serious withdrawal of brains from business. Men who would otherwise have been working out better designs for commodities and better methods of manufacture and planning to put more value into their products, Mr. Ford said, were drawn off from the work they were best fitted to do by the promise of quick profits in speculation.

Another reason, he said, is that American production has come to equal and even surpass, "not our people's power to consume, but their power to purchase. This is not the same thing as over-production; it is under-supply of purchasing power."

Labor to Make No Wage Demands

The meeting of the labor group, made up largely of representatives of the American Federation of Labor, was held immediately after the one with the industrial leaders. The labor group assured the President that there would be no demand for increased wages or any other wage movements, outside of those already under way.

The conference with trade associations and other informational services in the construction lines was held on Friday, and it was stated that data gathered indicated that there was about $2,200,000,000 of highway and road building projected throughout the country. It was declared that about half of this comprises Federal and State work and the remainder consists of country and municipal undertakings. It could not be estimated how much of this outlay would be undertaken during the coming year. Officials who have been making a survey of the residential building situation said that construction of this character for the first 10 months of 1929 was about $710,000,000 below the total for 1928. The American Institute of Steel Construction was represented at the meeting by Past-President W. M. Wood, Decatur, Ill.

Railroads Promise Aid

President Hoover clearly was gratified upon receiving assurance last Friday from railroad executives representing 97 per cent of the total railroad operating revenue of the country that they would give their "sincere and earnest cooperation" to the stabilization and stimulation of business. This statement grew out of the meeting of railroad executives in Chicago and represented fulfillment of the pledge given the President by railroad executives at the first business conference that they would attempt to secure the cooperation of the entire railroad interests.

The receipt of the message, based on the action taken in Chicago, brought the oral statement from the White House that it meant the sustaining of larger employment in the railroad equipment industry and bringing substantial increase to demands for steel. The message was conveyed through Chairman R. H. Aishton of the American Railway Association. He said that steel rail deliveries for 1930 are estimated at approximately 2,500,000 tons; that the number of freight cars on order on Oct. 1 was 29,481, a greater number than on the corresponding date in any year since 1924 and that this number has been increased as of Nov. 1 to 33,642, which is an increase of 27,561 compared with the same date a year ago. On Oct. 1, it was stated, there were 354 locomotives on order as compared with 113 on the same date in 1928 and 134 in 1927. There are also now on order, it was declared, approximately 1,500,000 tons of steel rails for delivery beginning early in 1930, with the expectation of increasing this total by 1,000,000 tons.

The announcement said that "Not believing that there is anything in existing conditions to require it the (railroad) executives have no purpose whatever to reduce or abandon any part of this program." A movement, it was added, to increase future capital and maintenance expenditures has been started and "is being actively and intelligently pressed forward." The meeting selected Mr. Aishton to act for the railroads as member of the committee of contact of the various industries.

Automobiles and Machinery Top Exports

Two Metal Products Have Displaced Cotton and Oil, Which for Years Dominated American Sales

"KING COTTON" has been dethroned as the leader in the American export trade. Department of Commerce figures for the first nine months of 1929 show machinery in first place, with 462.5 millions of dollars, followed in second place by automobiles and parts, amounting to 455.4 millions, while cotton is third with 444.5 millions. This is in sharp contrast with preceding years, of which last year made the highest previous record in machinery and automobiles.

In the first nine months of 1928 exports of cotton were 522.5 millions, of machinery, 365.3 millions, and of automobiles and parts, 373 millions. Last year petroleum and its products, at 396.7 millions, stood in second position, whereas this year, while oil is still second to cotton, it is in fourth position, as both have been passed by machinery and automobiles. Petroleum exported this year was 415.9 millions.

This is in keeping with the steady change which has taken place over the past dozen years in the general complexion of our export trade. Manufactured goods have been advancing year after year to a higher proportion of the total than ever before, and correspondingly crude materials have gone backward in relative position, although holding their own in total volume. In the figures above cotton is, of course, a raw product. The petroleum exports include largely refined oil, which is a manufactured product, but not with the same degree of manufacture as such complicated units as automobiles and machinery.

In passing it may be of interest to note that as recently as 1922 exports of automobiles stood in tenth position, whereas now they are second. At that time they were exceeded not only by cotton, oil and machinery, but also by wheat products, packing-house products, iron and steel mill products, copper and its manufactures, tobacco and cotton manufactures.

United States Airports Now Number 1509

WASHINGTON, Nov. 26.—There are 1509 airports in the United States, of which 440 are municipal, 465 commercial, 278 intermediate fields, 86 Government and 240 auxiliary, according to Clarence M. Young, Assistant Secretary of Commerce for Aeronautics. California leads all other States with 161; Texas is second with 101; Pennsylvania, third with 83; Ohio, fourth with 72; Illinois, fifth with 67, and New York, sixth with 57. There are of record more than 4000 other fields on which aircraft landings can be made. In addition to the 1509 airports and landing fields already in operation, approximately 1278 more airports are either proposed or in process of construction.

Galvanized sheet protection has been applied to 26 per cent of all classes of farm buildings in the United States, according to field investigations by the Trade Research Division of the National Association of Flat Rolled Steel Manufacturers, Cleveland.

To Discourage Liquor at Exhibits

American Foundrymen's Association Initiates Action Which Is Supported by Equipment and Supply Men and Exhibition Managers Association

A MOVEMENT has been started by the Association of Exhibition Managers to discourage entertainment and wholesale dispensing of liquor at business conventions and expositions, after like action had been initiated by the American Foundrymen's Association.

The Association of Exhibition Managers voted unanimously to indorse the attitude of the American Foundrymen's Association. The subject was introduced at the meeting of exhibition managers by C. E. Hoyt, executive secretary and manager of exhibits of the American Foundrymen's Association, who said:

We have viewed with much concern the increasing amount of entertainment of this character. We do not believe that conditions at conventions and exhibits of our association are any worse than they are at most conventions. In fact, we have been repeatedly assured by hotel managers and others that there is much less room entertaining at our conventions than there is at the conventions of a number of national associations.

We know that if we were to combat successfully this objectionable practice we would have to have the cooperation of hotel managers, exhibitors and members. Our first step was to bring the matter to the attention of the board of directors last April, at which time it was voted to make this question an order of business at our annual board meeting.

Our 1930 convention will be held in Cleveland and our next step was to address a communication to the manager of the convention board of the Cleveland Chamber of Commerce and secure from him assurances of cooperation on the part of the hotel managers of that city.

Mr. Hoyt then read excerpts of a letter he had sent to the Foundry Equipment Manufacturers' Association, as follows:

The board of directors of the American Foundrymen's Association feels that a condition has arisen in the conduct of annual conventions and exhibits which demands serious consideration; namely, entertainment and wholesale dispensing of liquor. The evils of this practice could be summed up as follows:

1. Detracts from and tends to defeat the real purposes of the annual gatherings.

2. Reflects discredit on the men of the industry.

3. Tends to discourage the attendance of men who would profit by and who could contribute to the convention.

4. Is an unwarranted expense which cannot justifiably be charged against the expense of exhibiting, but usually is.

Nearly all associations have this problem to contend with to a lesser or greater degree than we do. We have discussed the matter with hotel men. They deplore the whole business of having their rooms converted into bars, and we have been assured of their cooperation in any effort to stamp out the practice. They tell us that the breakage and damage is far in excess of any profits from the sale of "set-ups" and the damage to the reputation of the hotel is even more serious.

Mr. Hoyt's letter to the foundry equipment manufacturers went on to suggest that a rule be adopted similar to that which went into effect some time ago to discourage the giving away of souvenirs at foundry exhibitions. This rule, Mr. Hoyt says, has not entirely done away with the use of souvenirs but it has reduced it to a minimum.

He says that room entertainment has grown up in much the same manner as the giving away of souvenirs. It is largely competitive, he says, engaged in by companies because their competitors do it, or whose representatives believe the practice is necessary to get business.

"It is our belief that practically all those who engage in this practice at our or any other conventions would welcome relief from it," the letter continued. "We do not believe that the chief executives of any concern would give their representatives carte blanche expense accounts for this sort of entertainment if they were told that our joint associations disapproved and were given to understand that their competitors, as well as they, would be governed in accordance with the expressed wish of our associations."

As a result of this appeal to the Foundry Equipment Manufacturers' Association, Mr. Hoyt said, a resolution was recently adopted by that organization reading as follows:

Whereas, conditions have arisen resulting in excessive, lavish and wholesale entertainment, including the dispensation of intoxicating liquor, at the conventions and exhibitions of the American Foundrymen's Association, at which the members of this association are among the principal exhibitors, which abuses have resulted in conditions inimical to the welfare of the foundry industry and the foundry equipment industry,

And whereas, the American Foundrymen's Association has addressed a communication to this association on this subject under date of Aug. 26, 1929,

Therefore, be it resolved, by the Foundry Equipment Manufacturers' Association, at a regular meeting held at Schenectady, N. Y., on Aug. 29, 1929, that the members of this association believe the practice of promiscuous and wholesale entertainment of customers and others, with especial reference to the dispensing of intoxicating liquors at the conventions and exhibits of the American Foundrymen's Association, should be discountenanced,

And therefore, be it further resolved, that the members of the Foundry Equipment Manufacturers' Association pledge themselves to cooperate with the American Foundrymen's Association in the control and discontinuance of miscellaneous and unwarranted entertainment, which constitutes an unnecessary expense and is contrary to good business ethics.

Directly after receiving this assurance of cooperation from the exhibiting manufacturers, the board of directors of the American Foundrymen's Association at a meeting in Cleveland, Sept. 12, adopted unanimously the following resolution:

Whereas, the practice of lavish, unwarranted and wholesale entertainment in hotel rooms and elsewhere is being indulged in by certain exhibitors and others attending conventions of the American Foundrymen's Association, resulting in conditions inimical to the best interests of said association,

And whereas, such practices detract from and tend to defeat the purposes of such conventions, reflect discredit on the men of the industry, and discourage companies from sending their representatives to such conventions,

And whereas, such practices result in excessive, unnecessary and unwarranted expense, contrary to good business ethics and practices,

Now therefore be it resolved, by the board of directors of the American Foundrymen's Association, at the annual meeting held in the city of Cleveland, Ohio, Sept. 12, 1929, that exhibitors and all other interests concerned be requested to cooperate in the abatement of such practices, and that the manager of exhibits and the committee on convention arrangements be and they hereby are authorized and directed to take such action as in their judgment may be expedient or necessary to abate such practices.

Later the report of the Foundry Supply Manufacturers' Association was given. At its convention it indorsed the resolution adopted by the Foundry Equipment Manufacturers' Association.

Welding Conference at Purdue

Purdue University will hold its annual conference on welding at Lafayette, Ind., Dec. 11 to 13, under the joint direction of the Engineering Extension Department, (W. A. Knapp, professor in charge), and the Department of Practical Mechanics.

The value and interest of these meetings may be inferred from the fact that the first, held five years ago, lasted a single day. Three days are now required for lectures, demonstrations and exhibits of welding methods and equipment. Last year's conference was attended by 250 representatives of manufacturers.

Steel Mill Wages Higher in 1929

Fewer Employees in Most Departments—Weekly Hours Slightly Greater—Earnings Up 6 Per Cent from 1926

WASHINGTON, Nov. 25.—Average hourly wages in the iron and steel industry increased from 63.7c. in 1926 to 67.4c. in 1929, while the full-time weekly earnings rose from $34.41 to $36.48, according to the November number of the *Monthly Labor Review*, published by the Department of Labor. Full-time hours per week increased from 54.4 to 54.6 hr., but the present working week, it is pointed out, is less than in any year prior to 1926 and almost 12 hr., or 17 per cent, less than in 1913. Hourly wages in 1913 averaged 30.1c.

This story is the last of a series of articles showing hours and earnings in the iron and steel industry in 1929, the departments here covered being rail mills, bar mills, sheet mills and tin plate mills, together with averages for the industry as a whole.

Drop in Number of Employees

A striking feature of the study of the four departments is the reduction of the number of employees in 1929 in identical plants when compared with 1926. In all except the sheet mills, a decrease in labor force is noted. Of the 39 bar mills reporting for the current year, 28 were identical with those of 1926. In 1929 they employed 5057 workers, against 6112 in 1926, a decrease of 17 per cent.

The seven standard rail mills reporting for both years employed 2816 in 1929, compared with 3280 in 1926, a decrease of 14 per cent. Of the 15 sheet mills reporting in 1929, as against 14 in 1926, there were 12 which were identical; in the current year they employed 9698, compared with 9393 in 1926, an increase of 3 per cent. Eight identical tin plate mills, reporting for both years, engaged 8386 workers in 1929, against 8892 in 1926, a decrease of 6 per cent.

Work Week Slightly Longer

Full-time hours per week for bar mills were 55.6 in 1929, compared with 54.7 in 1926. This slight increase, it is pointed out, was due not to the inclusion of continuous or semi-continuous mills, but rather to an increase in working time in hand mills, the average time for hand mills being 56. During the same period an increase of 3.4c. an hour took place, wages rising from 59.1c. to 62.5c. an hour. Part of this gain was attributed to the inclusion of continuous and semi-continuous mills, although some increase was shown in the hand group also.

Average hourly earnings in 1929 were two and one-sixth times what they were in 1913. Average full-time weekly earnings amounted to $34.75 in 1929, more than 7 per cent in excess of those for 1926, and almost double the $17.71 in 1913.

Although an increase in average full-time hours per week of from 55.5 to 56 is shown for the standard rail mills from 1926 to 1929, the 1929 average is still 21 per cent less than that of 1913. Average hourly earnings increased from 59.5c. in 1926 to 62.8c. in 1929, while the full-time weekly earnings increased from $33.02 to $35.17, the 1929 earnings being almost twice the $18.01 of 1913.

Sheet and Tin Mill Conditions

Average full-time week in the sheet-mill department shows no change between 1929 and 1926, the average for both years being 48.9 hr. Average hourly earnings, however, rose 3.4c. in 1929, to 79.3c. from 75.9c., while full-time weekly earnings increased from $37.12 to $38.78. Earnings in 1913 were 48.3c. an hour and $25.26 a week.

The tin plate departments show a slight decrease in average full-time hours a week in 1929, declining to 47.4, compared with 48.1 in 1926. Average hourly earnings were 73.2c. in 1929, compared with 70.4c. in 1926. Average hourly earnings of 1929 are one and three-fourths times as great as those of 1913, but 23 per cent less than the 94.9c. of 1920. Average weekly earnings were $34.70 in 1929, compared with $33.86 in 1926, and were 81 per cent greater than the $19.22 in 1913. In 1920 average weekly earnings were $48.02.

Sharp Drop in Fabricated Plate Orders

WASHINGTON, Nov. 25.—Declining to 30,669 net tons or 39 per cent of capacity, orders for fabricated steel plate in October, reported to the Department of Commerce by 48 firms, were the lowest since June, 1927, when bookings reported were 28,811 tons. The lighest monthly orders reported to the Bureau of the Census since it began collecting the figures were in February, 1924, with a total of 18,768 tons. Orders in September were 41,653 tons, or 52.9 per cent of capacity.

Bookings in October for oil storage tanks were 8607 tons, against 15,189 tons in September; for refinery materials and equipment, 3316 tons, compared with 4009 tons; for tank cars, 2393 tons, against 2779 tons; for gas holders, 985 tons, compared with 3353 tons; for blast furnaces, 853 tons, compared with 200 tons and for stacks and miscellaneous purposes, 14,515 tons, against 16,123 tons.

Oil storage tank bookings in October made the lowest total, with one exception (last June), since June, 1927. Those for gas holders were the smallest since the 978 tons of November, 1927. Stacks and miscellaneous made the poorest showing of the year, except for January.

Orders for fabricated steel plate for the first 10 months of 1929 aggregated 444,606 tons, against 437,951 tons for the corresponding period of last year. Operations were at the rate of 55.9 and 55.1 per cent of capacity respectively.

Ten-month orders for fabricated steel plate for the different lines of consumption follow, with 1929 first: Oil storage tanks, 126,063 and 195,230 tons; refinery materials and equipment, 44,381 and 30,529 tons; tank cars, 32,558 and 18,806 tons; gas holders, 40,264 and 27,426 tons; blast furnaces, 9579 and 7415 tons; stacks and miscellaneous, 191,761 and 158,545 tons. In every category except oil storage tanks, the 1929 ten-month total is higher than for all of 1928.

Bopp Steel Corporation Organized in Detroit

The Bopp Steel Corporation of Detroit held its organization meeting and elected officers at a stockholders meeting recently in Detroit. This company will manufacture cold-rolled strip steel. The following officers were elected: President, A. J. Bopp, formerly Weirton Steel Co.; vice-president, F. C. Smith, formerly Fisher Body Corporation; secretary and treasurer, J. H. O'Hara, president, J. H. O'Hara Co. and Manistique Lumber & Supply Co. These officers serve on the board of directors with J. W. Gier, Motor Wheel Corporation, Lansing, and H. L. Maher, formerly chief electrical engineer, Ford Motor Co.

Eugene H. Meyer has been appointed superintendent of the cold-rolled strip mill. He was formerly with Weirton Steel, Superior Steel Corporation, and the American Tube & Stamping Co.

Contracts have been placed for the mills, motors and annealing furnaces, and construction on the buildings will be started about Dec. 1. The plant will be located on a site owned by the company at Tireman Avenue and the Pennsylvania Railroad. From present indications, the plant will be ready for operation by April 1, 1930.

Birmingham Bolt Plant to Be Further Enlarged

Following the recent merger of the Lamson & Sessions Co. and the Lake Erie Bolt & Nut Co., of Cleveland, instructions have been issued for the addition of another unit to the new plant of the Lamson & Sessions Co. under construction at Birmingham. Upon the completion of this plant, it is proposed to consolidate certain departments of the American Bolt Co. plant with it. The American Bolt Co. was taken over by the Lake Erie Bolt & Nut Co. last August. It will continue to operate until the new plant at North Birmingham has been completed.

Recovery to Be Strong—Verity

Ebb and Flow of Activity Must Be Expected, But Business Always Goes Ahead Stronger After Breathing Spell

"THERE are no doubt many who now believe that our national income, large and diversified as it is, has been seriously reduced and that there has been a huge decline in values, through the recent drastic decline in the securities market. That is, of course, a great mistake, born of the individual tragedies of the situation and of a misunderstanding of the real relation between business and the securities market," said George M. Verity, president, American Rolling Mill Co., in addressing the Ohio Management Conference at Columbus, Ohio, Nov. 20.

"There has been no decline in real value. There has been a temporary decline in the market values of the securities representing business as estimated by the stock market, but while market values change constantly they do not affect or change real values.

"While the temporary earnings of business are always proportionately decreased during any period of lessened activity, the real average earning capacity of any sound and properly financed institution is not affected in the least by either a period of quiet business or by the fluctuations in the securities markets.

Earning Capacity Requires Three to Five-Year Test

"The temporary earning capacity of any company must, of course, respond to any decline in the normal volume of current business, no matter what the cause.

"The earning capacity of a company or the real value of its issued securities can be fairly appraised only by the results obtained over a period of three to five years. During any such period business is bound to be affected by the many influences that exist peculiar to the period and by the changing tides of supply and demand and of production.

"What a business can and does do in a five-year period in spite of all these changing influences reflects the average of its real earning capacity.

"As the world is now organized, the tides of life and of business cannot be stopped. They can only be checked, because both life and business are extremely resilient.

"The 17,000,000 stockholders of our corporate institutions can be assured that, somewhat in proportion to the length and depth of a decrease in volume of business in any given period, the country will enjoy a corresponding period of activity when the influences which brought about the temporary recession have passed.

"The country can congratulate itself that, in spite of the great commercial and industrial activity of the past four years, basic business conditions were never sounder than they are now.

"Economic laws have been served in that period as never before. Such prosperity as we have enjoyed has been due to a sound, consistent and insistent demand, to a steady decrease in the costs of production, a marked increase in the quality of product and in the giving of increasingly better values to the consumer.

"As a result there has been and is no inflation in either prices or inventories, while the average earning capacity of the worker has gradually increased and living conditions have been the best ever known.

"Due to the extended period of great activity in almost every line of human endeavor, business was beginning to show signs of fatigue before the collapse of the stock market.

"It would be absurd to believe or to argue that business, sensitive to all influences as it is known to be, will not show some decrease in volume for at least a time.

"In any particular period of quiet business some lines are affected more than others, and there are always a good many that are affected but very little. A cross-section of the commerce and industry of the country usually shows a very fair average of operation.

Greater Acceleration Follows Every Temporary Recession

"Just how long it will take to get things going fully normally again is all a matter of individual opinion, but of this we can be assured: Our business structure is supported by great human, material, scientific and financial resources and by the well-known fact that the wants and the consuming and buying power of our people have been developed as never before.

"Each time we emerge from a temporary recession of business we go ahead stronger, more surely and more efficiently than we did before. Whatever the cause and effect, the recession always represents a period of practical readjustment, of general housecleaning, of refinement in organization and of improvement in all of the material things that affect efficient operation."

Change in Economic Thought Traced to Taylor

"Take your eyes off the distribution of wealth and put them on the creation of surplus." This conception, first brought into the shop by Frederick W. Taylor, 30 years ago, is now replacing the assumption of a deficit civilization that previously underlay all economic thought, said Robert W. Bruere, research secretary, J. C. Penney Foundation, in addressing the New York Metropolitan Section of the Taylor Society at a dinner meeting at the Fraternity Clubs, New York, Nov. 21.

The philosophy of optimism that scientific management ushered in is permeating all walks of life. It took a long time before industrial relations could be based on anything but a spirit of conflict, but today labor problems, to an increasing extent, are being approached in a spirit of research instead of antagonism.

In commenting on Taylor's belief that the brotherliness of capital and labor would create so much surplus that the division of wealth would no longer be a problem, Frank Copley, author of "Frederick W. Taylor, Father of Scientific Management," stated that this view did not impress him at first because it did not take into account envy. But the years seem to have borne Taylor out, Mr. Copley added. With the generally improved standard of living among the masses, the man who is able to ride around in a Ford is not worrying much about the man who travels in a Lincoln.

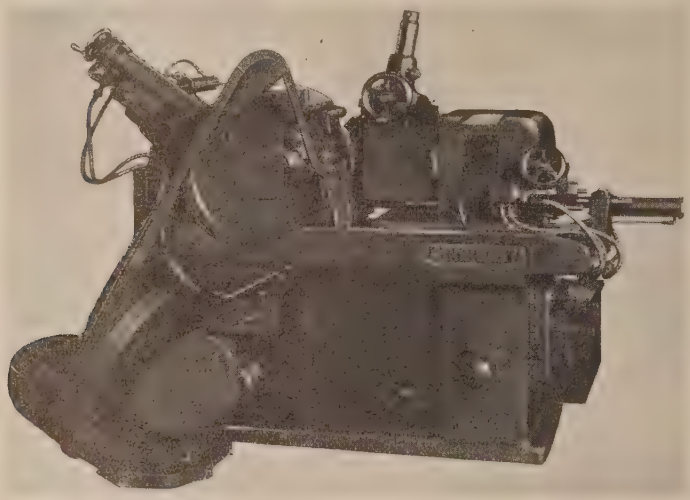
Scientific management is not a rigid, mechanistic thing, but something that one must create and adapt to fit a particular situation; the thing that is universal about it is the manner of approach to management problems, said Dr. Harlow S. Person, managing director, Taylor Society, in the course of remarks outlining the preparation and contents of the new Taylor Society Book. The volume was written following a request from Czechoslovakia for an up-to-date textbook on scientific management suitable for use in higher educational institutions. Containing nearly 500 pages, the book is of multiple authorship, with about 85 per cent of the text devoted to an exposition of the technique of scientific management and 15 per cent to its origin, its philosophy, its principles, its economic significance, etc.

In the general discussion which followed the addresses Dr. Person pointed out that the reaction to scientific management in this country has been to a large extent a seizure on mechanisms, while in Europe the philosophy and principles have been given more attention than the technique. Col. King Hathaway, consulting engineer, offered the comment that it is a mistake to regard principles as the only essential thing and to think technique unimportant. No matter how sound principles may be, mechanisms are necessary to apply them.

The question was raised as to why it is usually easier to convince the worker of the benefit of scientific management than the employer. One reason, according to F. A. Silcox, New York Employing Printers' Association, is that some years ago poor systems were put into shops, in many cases, by incompetent engineers. The overhang of that period is still felt.

Floor-Level Type Hopper for Centerless Grinder

FULL-AUTOMATIC grinding of piston pins, small rollers, bushings and other straight cylindrical work is obtained on Cincinnati centerless grinders by means of a floor-level type of hopper recently developed for these machines by Cincinnati Grinders, Inc., Cincinnati. With this device, which eliminates manual feeding, one man can operate a battery of machines, his only duty being to fill the work basin of the first machine and check the size and finish of the pieces ground.



With the Continuous Hopper Feed the Centerless Grinder Is Fully Automatic

The hopper is driven by motor through a worm and wormwheel reduction and slip change gears which permit variations in feed to suit the flow of work through the machine. Work dumped into the work basin is carried upward to a delivery chute by a series of studs spaced to suit the work. Studs are mounted in a ring which is interchangeable on the main carrier disk. Timing of the hopper is adjusted so that the delivery of the work is slightly in excess of the machine requirements, the surplus work being returned to the basin by means of return chute. The hopper can be disconnected conveniently and removed from the machine. It is adapted for handling work through a series of consecutive machines, since the basin is low and gravity is utilized to bring the work from one machine to the basin of the next. Thus the work passes from the first machine through a series of other machines until the finished piece is of exact size.

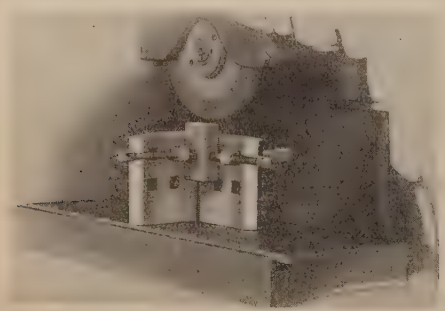
Clamping Block for Grinder and Lathe Work

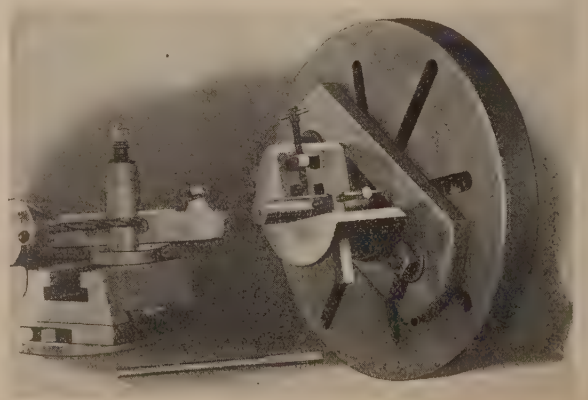
FOR the rapid squaring and clamping and the secure holding of odd or irregular shaped pieces that can be held in the common lathe chuck, angle plate or vise, Homer Strong & Co., Rochester, N. Y., are offering the Squar-It clamping here shown. The device is for use in toolrooms, machine shops and inspection departments in laying-out, grinding, lathe and other operations. It is 3½ in. wide and 5½ in. long, overall, and the clamping surfaces are 2⅞ in. wide and 3½ in. high. The maximum capacity is 2⅛ in.

The device consists of a clamping block, two sliding clamps and two clamp screws. The blocks are made from semi-steel castings. After being rough machined they are heat-treated to relieve casting strains and then machined again. Finally all square surfaces are ground to close limits. The sliding clamps and the clamp screws are pack hardened. The screws have dog points and knurled heads with pin holes. Hardened clamping blocks for use in inspection departments can be furnished, as well as an adapter plate for holding the block more securely to the faceplate of lathes on long runs of work. For holding very short work close to the top of the block, a "T" sliding-clamp having two clamping screws in the head, one above center and one below center, is available.

In laying out, the square face of the work is placed against the clamping surface of the block and the clamp screws are tightened. This, it is pointed out, eliminates the indicating and tapping usually necessary to bring the work square when using an angle plate with ordinary parallel clamps. Used in connection with surface grinding, the broad face of the block makes generous contact with the magnetic chuck, and the work can be clamped easily and securely in position. The block can be used on the table of other machines merely by clamping securely to the machine table the steps on the back of the block. On lathes this clamping fixture can be used in connection with drilling, centering shafts, turning and boring. It is strapped to the faceplate, and the first piece of work fastened by tightening the two clamp screws, thus forcing the work into the two squared surfaces of the block. The next step is to indicate this first piece and correctly locate the block on the faceplate. Duplicating the pieces merely involves loosening and tightening the clamp screws. For long runs, use of the adapter plate is recommended.

The net weight of the device, with clamps and screws, is 8 lb.

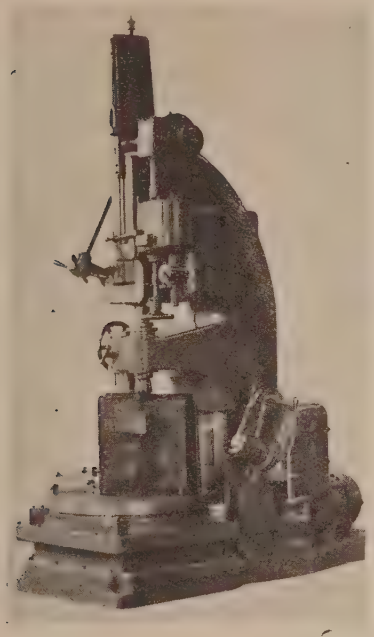




Holding of Work on a Surface Grinder Is Shown Above and Use of the Clamping Blocks for Lathe Work at the Right

Vertical Drilling, Boring and Milling Machine

FOR face milling the round large bore of crankcases, as well as for standard drilling, boring, reaming and tapping operations, the Defiance Machine Works, Defiance, Ohio, has brought out a special 36-in. swing heavy-service drilling, boring and vertical milling machine. It has an inclosed head, and the feed and speed boxes are oiled by means of a gravity or continuous flow system.



Face Milling, Drilling, Boring, Reaming and Tapping Operations Are Performed

The machine has a single pulley drive. Spindle speeds are obtained by two cones of hardened gears running idle except when one set is meshed by a roll-in hardened gear operated by a convenient lever at the side of the machine. Helical gears drive the spindle at the bottom of the head or close to the spindle nose. There are two keys through the driving sleeve into the spindle, and the thrust of the keys and the helical gears is taken by a large thrust anti-friction bearing.

The 36-in. revolving table is driven by a 2-hp., 1750-r.p.m. motor, through worm gearing, while the machine proper, including the spindle drive, feed and speed, is driven by a 7½-hp., 1200 r.p.m. motor. The principal specifications are: Diameter of spindle, diameter of spindle nose and diameter of spindle sleeve, 3½ in.; length of power feed, 16 in.; Morse taper in spindle No. 5; width of helical drive spindle gear, 2½ in.; center of spindle to face of column, 18 in., and maximum distance nose of spindle to top of table, 41 in. Plain table, compound table or tapping attachment can be furnished. The machine occupies a floor space 50 x 94 in. and weighs 8800 lb. net.

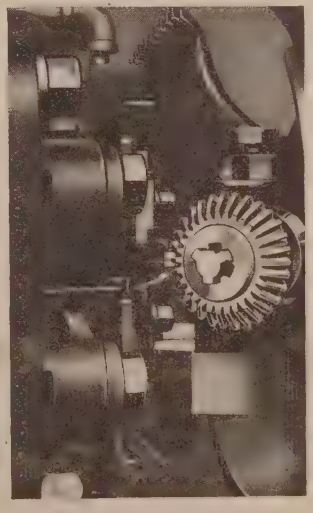
3-In. Straight Bevel Gear Generator

GEARS up to 4½-in. pitch diameter, 2¼-in. cone distance, and 10 diametral pitch can be cut on the 3-in. straight-bevel gear generator brought out recently by the Gleason Works, Rochester, N. Y. The machine, a companion to the 3-in. spiral-bevel gear generator described in THE IRON AGE of Sept. 19, is adapted for either large or small production and will both rough and finish in either one or two operations, depending upon the pitch quality and work desired.

The generating principle is the same as used in previous Gleason straight-bevel gear generators. The tooth shape is developed by rolling the teeth between reciprocating tools which represent adjacent sides of a tooth in an imaginary crown gear.

An outstanding improvement incorporated in this machine is the quick throw-out mechanism which enables the operator, by a single throw of a lever, to move the tool-head into or away from the cutting position. This provides ample room for chucking or removing the gears.

The work-head is mounted on a cradle on which it is adjustable angularly and in the direction of the work spindle to permit setting the work to the proper cutting angle and cone distance. The index, of the notched plate type, is actuated by the generating motion. The work segments are adjustable so that each segment covers a range in pitch angle from about 1 deg. on the small pinion segment to 7 deg. on the largest gear segment. Thirty-two segments cover the entire range of the machine.



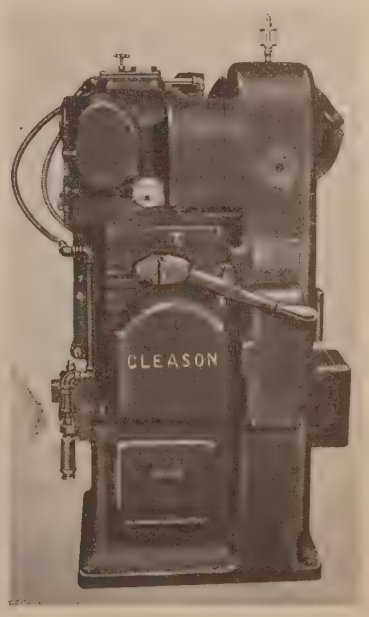
Straight-Bevel Gear Generator for Gears Up to 4½-In. Pitch Diameter. The tools and work are shown above

Feed motion is imparted to the tool-head directly through a cam. The clapper blocks are mounted in the clapper boxes and swivel on bronze taper pins located behind the cutting edges of the tools. Consequently, only a slight movement of the blocks is required for the tools to clear the work on the return stroke. This slight motion is emphasized as a factor in making the machine smooth, quiet and efficient in operating at high speed. The drive for the tools has the effect of a draw cut, inasmuch as the power is applied to the slide connections well ahead of the tool. Length of stroke can be changed according to the face length of the gear being cut, the maximum face being ⅞ in. Tools used in this machine are identical with those used on the larger straight-bevel gear generators, except for size.

Feeds and speeds are regulated through accessible change gears. Feeds are from 1½ to 30 sec. per tooth, and tool stroke-speeds range from 200 to 800 per min. A circulating oil system built into the tool head furnishes clean oil to the tool drive and to the arms and slides, while another circulating system, built into the speed bracket, circulates oil to all points of the feed mechanism.

The machine is furnished with built-in motor drives only, a ½ hp. motor driving the tools and a ¼ hp. motor the rest of the machine. Floor space occupied is 27 x 31 in., and the net weight of the machine is 1500 lb.

The General Refractories Co., Philadelphia, has appointed the Bison Builders' Supply Co., 1345 Genesee Street, Buffalo, as its dealer representative in Erie County, N. Y., for Grefco chrome high temperature cement and Standard silica bonding cement.



Pressure Gage to Use With Resistance Welders

A SELF - CONTAINED pressure gage is being marketed by Gibb Welding Machines Co., Bay City, Mich., for enabling the operators of resistance welders to set and hold their equipment to the correct operating

(At Left) The Gage Enables Setting and Holding the Welding Equipment to Correct Operating Pressures

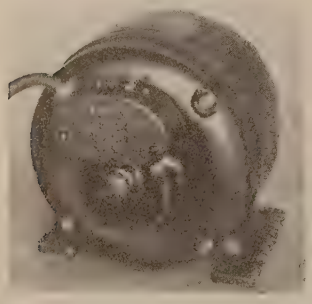
(At Right) The Wide Range of the Micrometer Is Obtained by the Four Interchangeable Anvils

performances. It consists of a small flat oil-reservoir connected with a dial indicator. It is chromium plated and weighs about 2 lb.

In use, the disk-like reservoir would be placed between the electrodes, movable vises or heads of the welding machine and the lever throw adjusted to produce the correct welding pressure. Once set, conditions may be maintained constant. Wear on welding dies is compensated for by repeating the test at appropriate intervals and adjusting the links or other pressure producing mechanism.

Small Motors with Built-In Switch

FRACTIONAL-HORSEPOWER split phase induction motors fitted with a built-in switch, which in addition to facilitating starting and stopping, eliminates the necessity of plug-

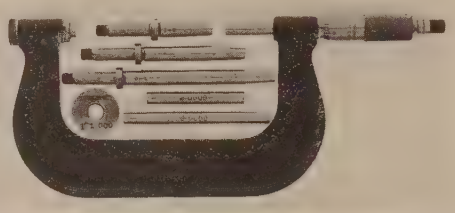


The Built-In Switch Which Facilitates Starting and Stopping Is a Feature of the Motor at the Left

ging in the current connection, are being marketed by the Reynolds Electric Co., 2650 West Congress Street, Chicago. Designated as the type C, they are made in four sizes, 1/20, ⅛, 1/6 and ¼-hp., respectively. The motor is practically inclosed, but means are provided for free circulating air about the core and through the windings of the motor, a temperature rise of 40 deg. C. being said to be the maximum under constant-duty full-load conditions.

Micrometer with 0 to 4-In. Range

FROM 0 to 4 in., by thousandths of an inch, is the range of a new micrometer caliper, designated as the No. 54, which has been added to the line of the Brown & Sharpe Mfg. Co., Providence. With this range, obtained by means of four interchangeable anvils of different lengths, the one tool performs the work for which a set of four micrometers has been required. It is adapted for measuring



practically all automobile parts, including pistons, camshaft bearings, wristpins, crankshaft bearings and pins. The tool is furnished with a ratchet stop and set of three standards, unless otherwise ordered.

Welded Grab Bucket

A SINGLE-HOOK grab bucket has been placed on the market by Edgar E. Brosius, Inc., Sharpsburg, Pa. As shown, this bucket is built up with structural shapes and plates and, with the exception of the lips, is electrically welded throughout. The lips are of manganese steel and are riveted to the scoop.

With capacity of ½ cu. yd., the bucket can be attached to any crane or hoist. It trips by hand line from the operator's cage or ground, and opens without shock to the crane or bucket. The latching mechanism is simple and the maintenance is said to be low.

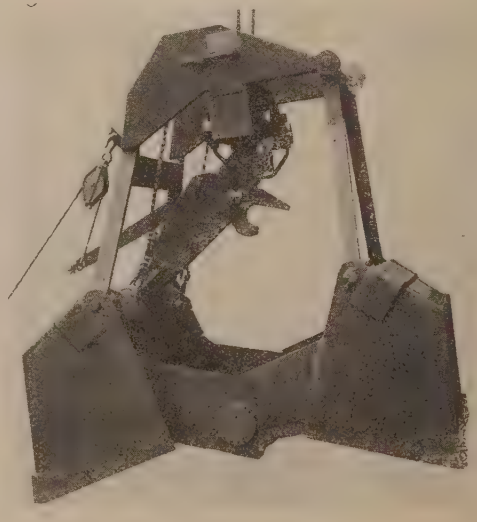
Cut and Ground Thread Tap Standard Proposed

A draft of the proposed American standard for dimensions of cut and ground thread taps is now available, through the American Standards Association, 29 West Thirty-ninth Street, New York, for review and criticism. The draft covers machine screw, end, tapper, nut and pulley taps. Standard tolerances on all dimensions are included.

A foreword to the proposed standard points out as its most important features: Adoption of larger major diameters to allow for greater wear; increase in minimum pitch diameters on cut thread taps over ¾ in. diameter to compensate for lead error; adoption of a comprehensive standard for ground thread taps; and standardization of a number of elements not heretofore covered.

Technical committee No. 12 of the A. S. A. general committee on standards for small tools and machine tool elements prepared the draft under the chairmanship of Charles M. Pond, manager of the small tool and gage division of the Pratt & Whitney Co., Hartford. The Society of Automotive Engineers, the National Machine Tool Builders' Association and the American Society of Mechanical Engineers are sponsors.

Location factors for industry in the Buffalo district forms the subject of a paper by Charles Langdon White, which is reprinted from the Denison University bulletin, Journal of the Scientific Laboratories. The reprint in 20 pages, with illustrations, points out many of the special facilities, including water transportation to overseas markets through the New York State barge canal or the Welland Canal in Canada.



Fabrication by Welding and Ease of Operation Are Features of the Grab Bucket at Right

United States Faces a New Economy

Rapid Initial Growth Is Past and Industry Is Concentrating on Intensive Cultivation of a More Restricted Market

"THE United States, while still relatively a new country, shows definite signs that a period of more settled existence has begun," said Magnus W. Alexander, president of the National Industrial Conference Board, New York, in addressing the World Engineering Congress at Tokio, Japan, on the "Economic Evolution of the United States, Its Background and Significance."

"The rate of increase in manufacturing, as well as in what may be referred to as the agricultural plant," he declared, "has of late been declining. Contrasting the annual rate of increase during the last 30-year period of the nineteenth century with the annual rate of increase during the present century, it is found that the rate in manufacturing was 6.9 per cent in the former as against 3.8 per cent in the latter. Similarly, the annual rate of growth in agriculture was 3.4 per cent as against 1.3 per cent; and in mining, 7.6 per cent as against 4.5 per cent."

Reduced Economic Growth Brings New Problems

This reduced rate of growth, according to Mr. Alexander, accounts for many recent economic changes. "The limits within which it is possible to increase the land area capable of cultivation are being approached, and indications are that manufacturing plants are nearing maximum size for efficiency.

"This tendency has stimulated efforts to increase efficiency through intensified rationalization, that is, improved organization, technique and planning, and by similar means. The conservation movement, scientific management, standardization and elimination of waste, consolidation and mergers in production and distribution, trade associations and industrial institutes, and similar organizations have thus received impetus from the forces which have made the decline in rate of growth in economic expansion."

Pointing out that the United States no longer is a seller's market, but has become a buyer's market, Mr. Alexander states that manufacturing is now more than a production problem.

"Producers today," he asserts, "are realizing that they must be alert in adjusting their output to the available markets, foreign as well as domestic. As against the flair for magnitude, speed, ruthless competition and an element of gamble, which characterized American business life in the nineteenth century, there is today a tendency toward consolidation and association for greater efficiency, careful planning on the basis of diligent research, and much concern over the ramifications and effects of economic life upon social progress."

"Benevolent" Circle Replaces "Vicious" Circle

Instead of trying to keep up with rapidly expanding demand, industry is concentrating on the intensive cultivation of a relatively stable market. The purchasing power of wages has become a matter of prime concern.

"High wage levels, while originally an incidence of labor scarcity and later of wartime demands and inflation, have become a distinct element of American economic life. In fact," says Mr. Alexander, "a definite philosophy has arisen from the relationships of high wages, intensive productivity and national purchasing power. It may be said that the trend of American business policy today is toward creation of widespread consumer purchasing power by providing high wages and wage values which, in turn, tend to raise the standards of living among the masses.

"Thus there is being established a 'benevolent circle' in place of the 'vicious circle,' extending from high wages to high consumer purchasing power, to increased demand for manufactured goods and services, and to still greater industrial production, all of which makes possible intensified mass production methods resulting in still lower unit costs. These, in turn, lead to lower prices and thereby again raise the purchasing power of wages. While it is true that the United States is constantly seeking to expand its export markets, it is also a part of the modern American business creed that American industry's greatest potential expansion for the present lies in an expanding domestic consumption."

Increase in Real Wages and Savings

The extent to which this policy has already affected American business is indicated by the fact that in 1928 "the average American factory worker was enabled to buy with his weekly pay envelope fully a third more of the goods and services of the same quality purchased by him in 1914. . . . At the same time hours of work averaged only 48 a week against 52 in 1914."

While high wages have resulted in liberal spending, they have also been translated into an "enormous rise in savings deposits in banks, in assets of building and loan associations and in those of life insurance companies, which are in large measure built up by the wage earners and other persons of moderate income. The aggregate of these accumulated savings at the end of 1928 was over $50,000,000,000, as contrasted with $14,700,000,000 in 1914, representing an increase of about 250 per cent, while money inflation, measured by wholesale commodity prices, amounted during the same period to only 43 per cent, and the population had increased by only 23 per cent."

Installment Selling Necessary

Installment selling greatly widened the demand for manufactured goods among people who otherwise could not have purchased the articles in question, according to Mr. Alexander. "An output of 4,500,000 automobiles in the United States in 1928, for instance, could hardly have been reached without the deferred payment plan. A very small percentage of losses, even during times of business recession and declining employment, has helped to establish confidence in the soundness of installment merchandising. Although they vary with the kind of goods sold and the class of people to whom sold, it may be said on good authority that the losses of concerns extending installment credit averaged less than 1 per cent in recent years.

"Underlying the entire idea of installment selling is, indeed, a sound economic principle, although those who first practised it perhaps were not conscious of it. This principle is that productivity *creates* purchasing power, which statement might be called the American version of the economic doctrine first enunciated by Adam Smith —'the wealth of nations does not consist of the unconsumable riches of money, but of the consumable goods annually produced by society.'

"From 70 per cent to more than 90 per cent of all gas stoves, phonographs and radios, automobiles, furniture, mechanical refrigerators, pianos, washing machines, sewing machines and vacuum cleaners are sold on the installment plan.

"Total installment purchases in the United States have been estimated to amount at present to from $5,000,000,000 to $6,000,000,000 a year, which represents, however, in terms of value only about one-seventh of the total retail sales of the year. But even of the retail sales, more than half in value are credit transactions, while practically all installment purchases require a fairly substantial initial payment, with balances constantly reduced.

"The total amount of currently outstanding installment paper is estimated at from $2,000,000,000 to $2,500,000,000—about half of the annual new savings of the population."

Austin Co. Creates Foreign Department

The Austin Co., Cleveland, industrial engineer and builder, has created a department of foreign operations, this having been necessitated by the magnitude of its recent contract with the Russian Government to build an automobile plant and complete industrial city at Nishni Novgorod. H. F. Miter, general manager of the company's Cleveland district, has been named as head of the department, with the title of vice-president in charge of foreign operations. L. E. Cooney, who has been assistant sales manager, has been promoted to assistant general manager of the Cleveland district, of which he will have charge during Mr. Miter's absence in Russia.

H. F. MITER

L. E. COONEY

The company has established separate offices in Cleveland, providing 15,000 sq. ft. of floor space to serve as headquarters for the foreign operations department. More than 100 engineers and draftsmen are now employed in these offices in preparing plans for the construction that will begin next spring in Russia. Mr. Miter will go to Russia in April to supervise the beginning of actual construction work. C. G. Palmer, Cleveland district engineer, and Fred A. Colman, the company's foundry expert, are now in Nishni Novgorod superintending preliminary work. Quarters are being constructed there for the Austin organization and for 3000 Russian workers who will be employed when construction work is in full swing. The Oka River, which joins the Volga at Nishni Novgorod, is being dredged to allow ships to reach the site, and railroad and trolley lines are also being constructed.

It is planned to equip the plant for the manufacture of virtually every part of the automobile. Plans originally called for an initial production of 100,000 Ford automobiles annually, but this has been increased to 120,000 cars. The ultimate capacity is to be 500,000 cars. The Nishni Novgorod plant will be the key plant for Autostroy, the Soviet bureau for building automobile plants. This bureau intends to establish assembly plants in the various parts of Russia in the same manner as the Ford Motor Co. in this country.

Rail-Water Rates to Coast From St. Louis Area Lower

WASHINGTON, Nov. 26. — Reduced through rail-and-water rates on iron and steel and other products from central and southern Illinois, St. Louis, Evansville, Ind., and Henderson and Hopkinsville, Ky., to California ports are proposed in tariffs filed with the Interstate Commerce Commission to become effective Dec. 16. Rates on general iron and steel products would be 63.5c. to 71c. per 100 lb.; on iron and steel pipe, 71c., and on wire and wire goods, 85c. The rates proposed would meet those now maintained by way of the Illinois Central and Redwood steamship line. The schedules were filed on behalf of the Chicago & Alton, Illinois Terminal and the Chicago & Illinois Midland railroads as originating lines and the Louisville & Nashville and the Mobile & Ohio railroads as delivering rail lines. The traffic would move by way of Mobile, Ala., and New Orleans with water connection by way of the Gulf Pacific, Luckenbach Gulf and the Transmarine Corporation steamship lines.

Pipe Machinery Makers Are Consolidated

Merger of the Oster Mfg. Co., Cleveland, and the Williams Tool Corporation, Erie, Pa., pipe machinery manufacturers, involving properties valued at approximately $2,000,000, has been effected by the purchase by the Oster company of a controlling interest in the common stock of the Williams corporation. The stockholders of the latter company will exchange their stock for Oster company stock. Both companies will retain their corporate identity, at least for the present, and the only changes in the personnel will be the retirement of Horace W. Davis as president of the Williams company. He will be succeeded by Roger Tewksbury, vice-president and treasurer of the Oster company, who will be operating head of the combined companies.

The Oster Mfg. Co. manufactures die stocks and rotary head pipe-threading and cutting machines. The Williams company makes a line of pipe and bolt-threading machinery and pipe cutting-off machinery. The Williams company controls a plant in Brantford, Ont., under the name of the Williams Tool Corporation of Canada, which is also absorbed by the Oster company in the merger. The officers of the Oster company, in addition to Roger Tewksbury, are R. B. Tewksbury, president, and Arthur S. Gould, secretary. The officers who remain with the Williams company are E. P. Poole, vice-president, and J. E. Humble, secretary-treasurer.

Steel Freight Rate Change Is Again Postponed

WASHINGTON, Nov. 26. — For the second time, the Interstate Commerce Commission has postponed the effective date of its decision in the general steel rate case, an order last week naming March 20 as the new effective date. The decision affects all manufactured iron and steel products throughout Official Classification territory and the effective date was postponed in each instance at the request of the carriers, which claimed it was physically impossible to prepare the great volume of new tariffs in the time allotted.

The commission has reopened the case with respect to the application of alternative rates on bars, plates and shapes subject to a carload minimum of 80,000 lb., and also as to the fourth section (long-and-short-haul) order pertaining to circuity limitations. The commission has begun reconsideration, based on the record, of the request of producers of agricultural implements, etc., in Davenport, Ia., and Rock Island and Moline, Ill., and of the Highland Iron & Steel Co., Terre Haute, Ind., and the Terre Haute Chamber of Commerce for rates on bars, plates and shapes when shipped in carloads of 80,000 lb., equivalent to 75 per cent of the rate on shipments in carloads of 36,000 lb., the minimum carload. The decision, however, fixed the minimum at 40,000 lb., on all iron and steel products. Reconsideration as to bars, plates and shapes will not involve hearings.

The reopened phase of the fourth section order will be the subject of hearings to begin on Dec. 3 at the Merchants' Association rooms, 233 Broadway, New York.

Continental Iron & Steel Co., 33 Rector Street, New York, has established a Worcester, Mass., office at 44 Pearl Street, in charge of Simon I. Edinburg, who has been in business for himself for a number of years in Worcester.

This Issue in Brief

Forcing a business boom would have a boomerang effect, says economist. Early recovery from stock market crash seems assured, but an artificial bull movement might result in a new and more serious setback. — Page 1449.

* * *

High machining costs, due to hard spots in castings, can be cut if fins are allowed for in design. The fin acts as a chill. Move the parting line so that the fin occurs away from machined surface. Grind cores to fit closely, to reduce size of fins.—Page 1446.

* * *

Production increased by 15-min. rest periods, tests reveal. Quarter-hour recesses in morning and afternoon enlarge daily output.—Page 1454.

* * *

Fortunate manufacturer of today profits by others' experience, thanks to business papers, says economist. In former days business experience was a private and unadvertised possession.—Page 1452.

* * *

"Room entertainment" at conventions frowned upon. Too many "set-ups" nullify value to those who attend. Convention executives want liquor tabooed.—Page 1457.

* * *

Foreign customers of American steel makers increase their orders. October exports were 11 per cent above September. Gain for first 10 months of 1929 was 12 per cent over same period of 1928.—Page 1494.

* * *

Hardened copper alloys as strong or stronger than medium-carbon steels. Cold-rolled alloys weld easily and will not season or corrosion crack.—Page 1434.

Quick return to normal in automotive industry is promised President. Leaders confidently expect an early resumption of normal output.—Page 1455.

* * *

Chill cast bronze bearings wear faster in tests, but are more resistant to repeated pounding and static tension. For mechanical strength lead content should be kept near the lower limit of 12 to 25 per cent range.—Page 1433.

* * *

Hardens small high-speed steel parts in three-chamber, vertical furnace, heated with single gas burner. Temperature in each chamber is determined by size and number of holes in refractory tile bottoms.—Page 1436.

* * *

Black finish on rifle parts has twice the life of blue finish. For oil blackening, charge work into a retort with charred bone, heated to 900 deg. Fahr. Then saturate in mineral cylinder oil. —Page 1437.

* * *

Production increased 40 per cent by making minor changes in equipment. Metallurgical considerations prevented speeding the pulling of cold-drawn bars through drawing dies, so slow return of drawing head was changed to fast return.—Page 1439.

* * *

Success of your business depends 60 per cent on factors outside the business. The manufacturer who confines his thinking entirely to his own problems neglects the majority of the factors governing success or failure. —Page 1443.

Wage incentives second to general working conditions as a means of increasing output, tests reveal. Certain types of supervision are inimical to efficient work. "Nagging" slows up the worker.—Page 1454.

* * *

Machinery now king of export trade, displacing cotton. Foreign customers took over 462 million dollars worth of American machinery in first nine months of 1929.—Page 1456.

* * *

Business tide cannot be stopped, as the world is now organized, says George M. Verity. It can only be checked; business is extremely resilient.—Page 1459.

* * *

Secret rebate is one great evil of modern distribution, says Saunders Norvell. It places large distributer in a position to destroy smaller competitor.—Page 1444.

* * *

Casting test bars should vary with size of castings. Average tensile strength of gray iron decreases with thickness of section. —Page 1438.

* * *

Casting designer thinks too often in terms of the finished casting. The only safe basis is the sharpest possible attention to the *rough* casting, exactly as it comes from the sand.—Page 1447.

* * *

Detects copper in steel readily by etching with 1 to 2 HCl. The specimen should be annealed, then given a 20-min. etch. Over 0.20 per cent copper in low-carbon steel will be revealed, as the copper is not attacked by the acid.—Page 1445.

ESTABLISHED 1855

The President to the Rescue

THE President's conference with industrial leaders was obviously for psychologic effect. The public was getting scared and that always is dangerous. Consequently it was appropriate for the President, who alone commands national attention, to dispel fears. If we were under the domination of great economic motions no conference of industrial leaders, agreements, assurances or promises would stay them.

The halt in business that was previously in evidence was clearly ascribable to over production rather than to under consumption. The automobile manufacturers had been making too many automobiles. The zinc miners had been mining too much ore. The manufacturers of rayon, who had enjoyed the one good branch of the textile industry, ended by making too much of their own article. The bad situations in bituminous coal and in petroleum have been chronic. These industrial troubles are practically worldwide. Equally unsatisfactory situations could come about in steel and in copper if the producers of those commodities should cut loose. It is the good organization prevailing in those industries that preserves their well-being.

The petroleum producers after prodigious efforts seem to be bringing a semblance of order into petroleum production. On the other hand, the European cartel of zinc smelters has just been disrupted after a vain effort to regularize affairs in an industry wherein they did not control the initial production, the mines. The price for spelter has fallen to about the figures for 1913 and the American market sings to the tune of London, lest foreign zinc be landed here, duty paid. Obviously no conferences in the White House are of any effect upon such conditions.

Washington's Resultful Conferences

THERE is no point in questioning the ultimate influence of President Hoover's conferences on business—they have already had a far-reaching effect. This can be said despite the fact that the President, with his familiarity with economic reactions, could have had no illusions about the limitations of any program that might be undertaken at this time. But what merits admiration is that he saw that much nevertheless could be done and undertook to do it. By calling together leaders of various branches of industry for counsel he inspired them with the feeling of duty that always comes with the assumption of responsibility. They saw their own problems in the light of the greater problem confronting the country at large and with true public spirit gave assurances that they would proceed with a view to tiding business over its period of readjustment.

While it is doubtless true that railroads and manufacturers, in most cases, announced improvement programs that were already authorized, the important fact is that these plans were reaffirmed rather than reduced or abandoned, as might have been expected in view of our experiences following previous Wall Street crises. Likewise the assurances that wages will be maintained and unemployment kept at a minimum are gratifying, since it is realized that the larger corporations are well fortified with cash reserves to back up their promises.

To raise the objection that expansion of plant capacity is a poor remedy in the face of overproduction in a number of leading industries is to overlook the fact that considerable work can be undertaken to replace obsolete and obsolescent equipment in the interests of more efficient operations. As a matter of fact, the tempo of production was so high in a number of lines in the first nine months of the year that much current maintenance and repair work was slighted or postponed. This accumulation of reconditioning work is alone an important item.

Neither the President nor the public can be deceived by the promises of overzealous publicists that business will entirely escape the effects of the stock market crash. Popular buying power has been curtailed, and producers of consumer goods will feel that curtailment. Clearly the time calls for the marshaling of offsetting influences. Overextension of activity, such as apparently affected a number of manufactured products in the first three quarters of the year, certainly was not characteristic of public works. Many municipal and State projects, which were deferred on account of an unfavorable bond market, are now in a position where they can be expedited. The Federal Government has already taken positive action to accelerate work under its control.

Critics point out that expansion of public undertakings means a heavier tax burden, but that is preferable to the consequences of widespread unemployment. The pushing of governmental activity, therefore, is amply justified as an emergency measure to smooth out the business cycle.

Concern lest efforts to temper the effects of the stock market crash may overstimulate business, paving the way for a new boom, does not seem warranted by the widest stretch of imagination, following the shock that the country has just experienced. All remedies carry a risk, but a do-nothing policy at the present juncture would be much more dangerous.

How Many Lost in Stocks?

DURING the active and advancing stock market the common talk was that everybody was speculating. Since the big decline much has been said about the small percentage of the population that lost. There is a remarkable difference in the two appraisals, the first being several times the second.

In neither case has there been any direct and specific information. Such specific information as does come out is likely to be misinterpreted. There have been statements of various corporations as to number of shareholders. Adding the numbers together would make a formidable total, whereas the number of duplications is undoubtedly large. Even in the same corporation with preferred and common shares, there is some duplication.

With so much latitude for guessing there can be no doubt that human nature has entered in each case, making the early estimates of the number of speculators too large and the latest estimates too small. A large number of registered stockholders can be interpreted either way, that nearly everybody is interested in stocks and is therefore speculating, or that nearly everybody owns his stock outright.

Perhaps an illustration of how easy it is to guess wrong as to the conduct of the general public may be obtained from the automobile. If the rest of the world were furnished specific information as to the population of the United States, its per capita income by classes, the cost of automobiles and the cost of running them, the guess as to how many automobiles were in operation in the country would in all probability be far below the actuality.

The National Bureau of Economic Research has just issued a statement of income of the people of the United States, 1916 to 1926 inclusive, with division by classes. This furnishes a basis for guessing how many people are likely to be shareholders or speculators. For 1926 the total of 44,673,550 income receivers divides as follows:

Per cent	Annual income
99.00	Under $8,700
0.89	$8,700 to $43,750
0.10	$43,750 to $183,000
0.01	Over $183,000

If we allow ten automobiles to each income in the highest class, five to each in the next highest and two to each in the next highest we have a total of 1,049,929. The remainder would be automobiles owned by receivers of less than $8,700 income. Passenger car registration in 1926 was 19,237,171 and in 1928, 21,379,125. On account of replacements these figures contain duplications, and incomes have increased somewhat since 1926, but one is safe in assuming that this year fully 15,000,000 passenger cars are owned by people with less than $8,700 income, making approximately one owner out of three in this income class. Evidently as to the great mass of the people the tendency has been to own an automobile rather than purchase stocks outright or speculate in them.

The interesting point is buying power. Of the total income in 1926, 87 per cent was received by 99 per cent of the income receivers. There is a strong suggestion that general buying power has not been greatly affected by the stock market slump. The buying power of the future will be chiefly a matter of the course general trade takes.

To Throw New Light on Business

WHAT may we expect of the business council or super-committee that is to come into being out of the Hoover business conferences? Will it act as a governor to the business machine? If so, we shall have a new control of the business cycle.

As it is, the curves of ups and downs in business have been greatly flattened as compared with their swings prior to 1922. It took the depression of 1921 to force recognition of economic statistics as a tool of business. The mass of them that has since been coming to the business executive has apparently helped to dampen fluctuations. We have only to recall how known conditions of manufacturing and transportation have minimized the hazard of reduced inventories. Now, with the proposed business council, there is the suggestion of a further force to check declines or advances when either of these threatens to get out of hand.

It is presumed that this super-committee (to be organized under the direction of Julius Barnes, chairman of the Chamber of Commerce of the United States) will be essentially a fact-finding body. In that case, considerable time must elapse before it can be ready to make public statements, but thereafter, if it becomes a continuing institution, as seems to be the purpose, its findings should easily have a close time relation to current events. It is then reasonable to believe it may serve to curtail the swings of the business pendulum whenever facts seem to support such action. The thought naturally does not escape that the council will have serious responsibilities if its influence should prove so sweeping.

That the council may quicken and maintain respect for statistical information seems likely and it may develop the compilation of what is now missing but important. On the face of production figures, overconsumption may describe the condition of some markets. Steel output in ten months of this year, for example, has averaged 24 per cent above normal, normal being measured by what has been the rate of increase of previous years; including 1928, the average is 18 per cent for 22 months. The question needing answer is whether new uses have arisen at a much faster rate than in the past or whether in some lines absorption has been at a rate too high to last. The figures illustrate the absence of a good measure of the status of consumption. The council may prove to be the needed agency. It has possibilities so great that even limited performance will be immensely helpful.

Automobiles and General Trade

EFFORTS of the administration at Washington to preserve general trade activity are likely to be as successful as anyone could hope. They aim at continuance of such activity as can be continued and increase in such activity as affords opportunity for increase.

This virtually leaves out one great activity, the automobile trade, and it is worth while to get as

exact bearings as possible on this matter. One readily recalls comment at the close of 1927 along the line that perhaps dullness in the automobile trade was largely responsible for the lull in total trade activity; likewise predictions a year ago that the prospective great activity in the automobile industry would stimulate trade nearly all around. These views from the past give us some cue at the present time. As a matter of fact, automobile production in the second half of 1927 was the lowest for any second half in many years and was 37 per cent below the highest second half production then on record

As to the recent performance we may now take stock as it is ended. The gage we use is the convenient one of totals for 12 consecutive months. As production last September was under that in the preceding September, we have the 12 months, September, 1928, to August, 1929, inclusive, as the record high. The total of cars and trucks in the United States and Canada was a trifle over 5,800,000.

There was a remarkable bulge, as may readily be observed, for 1923 made a record with 4,180,450, 1924 was off, 1925 and 1926 made new records by small margins, 1927 was off and 1928 made another new record by a small margin. After 1923 there were three years with fresh records, yet 1928, at 4,601,141, was only 10 per cent over 1923, five years earlier. The 12 months through last August ran 26 per cent higher, this gain being in less than a year, whereas previously the average rate of increase was only 2 per cent per annum.

The apparently low production of automobiles at present is in part seasonal and in part a reaction from the bulge. Last month's production, 394,465, was less than two preceding Octobers only, in 1925 and 1928. If the average seasonal variation of the last five years be taken as criterion, last month's production was in keeping with a calendar year total of 4,700,000. Furthermore, if December were related to October by the average proportion of the last five years, its production would be only 247,000. If it were 147,000 or 47,000 or nothing, it would not make a great deal of difference in the long run.

The object of these comparisons is to bring out the fact that a mere return of automobile production to its general trend line makes what looks like a very dull industry, and accordingly the dullness does not furnish a basis for predicting a large increase or recovery. It is a matter of reaction or return to the trend line of the long range past, rather than to the line made by the recent bulge. The heavy buying recently was not ultimate consumption, it was a matter of early replacement, reducing the average age of the cars in service. The accepted computations show 1923, six years ago, to have been the biggest year for new buying. Replacements have since increased so much that they have made up for decreased new buying and supplied an increase for the total production. All of which is not to argue that it would not be better for many more cars to be replaced if the owners can afford to do so, for their own safety and for the safety and comfort of other drivers.

CORRESPONDENCE

Aluminum Can Be Slush Molded

To the Editor: On page 1096 of THE IRON AGE, Oct. 24, it is stated that slush molding (casting) cannot be applied to aluminum. It is not clear from the statement made as to whether zinc is poured in metal molds or in sand molds. There is considerable scope for the production of both zinc-base and other white-metal alloy castings, as well as aluminum, by slushing in metal (cast iron) molds. Several plants in this country and abroad have long used the slush-casting process for the production of certain hollow castings in aluminum alloys.

The statement that slush-casting cannot be applied to aluminum it not true. The process is applied in practice and is finding increasing use.

Vice-President in Charge of Production,
Fairmont Mfg. Co.
Fairmont, W. Va.

Is Endurance Limit Raised by Overstress?

To the Editor: "Does overstress increase or decrease the endurance limit?" In your issue of Nov. 14 you raised this question, quoting me as an authority for an affirmative answer and Messrs. Smith, Connor and Armstrong as authorities for a negative answer.

The tests I have quoted may be found described in Bulletins 124, 136 and 165 of the Engineering Experiment Station of the University of Illinois. All the results were based on long-time endurance tests. It was found that, for a small number of repetitions of stress to reduce the endurance limit appreciably, the stress must be far above the endurance limit. It was found that, if a fatigue crack had spread to the point where it could be detected without the aid of a microscope, the endurance limit of car axle steel was very markedly reduced.

It has been our experience at Illinois that attempts to determine endurance limit by any kind of a yield point test are of doubtful value.

H. F. MOORE,
Materials Testing Laboratory,
University of Illinois, Urbana, Ill.

Warping Controlled When Welding Structural Steel

Welding structural steel with an oxy-acetylene flame is generally thought to produce considerable warpage. H. H. Moss, development engineer Linde Air Products Co., New York, told the International Acetylene Association recently that welding a major structural frame, during the past year, has provided observations on the warpage effect over a wide range of conditions and it has not been found to be a prevalent characteristic, but is confined to connection details between ends of members. Its control is a matter of designing so the forces set up by localized heating are balanced with respect to the center of gravity on the section being welded.

Experience in welding the heavy shapes has demonstrated that as the mass of the part increases the warpage effect decreases. A practical demonstration of warpage control in a structure of good size may be seen in a structural frame erected by oxy-acetylene welding at Niagara Falls, N. Y. The alinement of the welded steel in this job, which contained approximately 300 tons of miscellaneous shapes, was excellent and was accomplished (with but few exceptions) without corrections subsequent to welding.

A.S.M.E. Meeting Program Comprehensive

More than 25 technical sessions have been arranged for the annual meeting of the American Society of Mechanical Engineers, which will be held at the Engineering Societies Building, New York, Dec. 2 to 6.

The machine-shop practice division will hold a session on Dec. 2, with a paper on "Quality Control and Product Gages," by Earle Buckingham, associate professor of engineering standards and measurements, Massachusetts Institute of Technology, Cambridge, Mass. A joint session with the A.S.M.E. committee on the cutting of metals, on Dec. 3, will include the following papers:

"Turning with Shallow Cuts at High Speeds," by H. J. French, International Nickel Co., Bayonne, N. J., and T. G. Digges, assistant metallurgist, Bureau of Standards, Washington.

"Power Required to Drill Cast Iron and Steel," by O. W. Boston, director of engineering shops, University of Michigan, and C. J. Oxford, chief engineer, National Twist Drill & Tool Co., Detroit.

"A Test Code for High-Speed Steel for Turning Tools," by Lewis H. Kenney, United States Navy Yard, Philadelphia.

"Present Practice in the Use of Cutting Fluids," compiled by S. A. McKee, engineer, friction and lubrication section, Bureau of Standards.

At a joint meeting of the lubrication committee and the machine-shop practice division, Dec. 4, G. B. Karelitz, research engineer, Westinghouse Electric & Mfg. Co., will present a paper on "Performance of Oil Ring Bearings." A session on mechanical springs, Dec. 2, will include: "Present Status of the Mechanical Spring Art," by J. K. Wood, consulting engineer, New York, and "Elastic and Inelastic Behavior in Spring Materials," by M. F. Sayre, assistant professor applied mechanics, Union College, Schenectady.

"Use of Economic Manufacturing Quantities," a paper by R. W. Kent, Bigelow, Kent, Willard & Co., Boston, will be presented at a symposium on production management, Dec. 5. Other papers at this symposium are: "Twelve Years' Experience with Economic Production Quantities," by C. H. Best, and "Advantages Derived for the Simplification of Fundamental Formulas for Economic Production Quantities," by F. E. Raymond, assistant professor of industrial research, Massachusetts Institute of Technology.

"Metallurgy in the Railroad Field," a paper by Charles McKnight, metallurgist, International Nickel Co., New York, will be a feature at the railroad session, Dec. 5. Simultaneously, at a general session, Dr. D. S. Jacobus, Babcock & Wilcox Co., New York, will speak on "Working Stresses for Steel at High Temperatures," and G. B. Karelitz, Westinghouse Electric & Mfg. Co., and O. W. Ellis, Ontario Research Foundation, Toronto, Canada, on "A Study of Tin-Base Bearing Metals."

Three sessions on applied mechanics have been arranged. Papers at the first, Dec. 2, are "Factors of Safety and Working Stress," by C. R. Soderberg, Asea, Vesteris, Sweden, and "The Mechanics of the Plastic State of Metals," by A. Nadai, research department, Westinghouse Electric & Mfg. Co. The third session, Dec. 3, will include "Natural Frequency of Gears," by R. E. Peterson, research engineer, Westinghouse Electric & Mfg. Co.

The Week in Business

Drift of Current Financial and Economic Opinion

THE resiliency of business under the impact of the stock market crash and the disappearance of unreasoning pessimism are sources of widespread encouragement.

"The most satisfactory feature of the situation at the moment—and it is a very reassuring feature," says the *Commercial and Financial Chronicle*, "is that . . . things are rapidly returning to normal.

"Evidences of this are met on every side. In the first place, the stock market is at length regaining tone, after the violent convulsions which it suffered. It has shown strong rallying tendencies the present (last) week and this, too, on a light volume of business, indicating that as far as the market as a whole is concerned, selling pressure is no longer an influence playing havoc with prices."

This journal also calls attention to the large shrinkage in brokers' loans, the strong revival in the demand for bonds and the cheapening of money rates "in every direction."

Hoover Conferences Timely

President Hoover's conferences, in checking hysteria, were "timely and just what the situation required," in the opinion of the *Chronicle*, "though it would be too much to expect that the ill consequences of the stock market debauch can be completely overcome, no matter how resolute the purpose and however well designed the means employed to that end."

Approval of the Administration's action is not shared by Benjamin Baker, *Annalist*. While recognizing the desirability of reassuring public sentiment, he feels that the Washington meetings clouded rather than clarified the business outlook. "The inadequacy of such measures for overcoming business depression arises from the uncomfortable fact that the depression itself is, in large part, due to what is now proposed as its remedy, namely, expansion in industrial production."

Diverting Influence of Speculation Removed

The salutary results of stock market liquidation are receiving more emphasis as business men become readjusted to the new situation facing them. One of these, not measurable by statistics, is the removal of the lure of easy money and renewed concentration on one's own business, according to John T. Madden, president, Alexander Hamilton Institute, and dean, New York University School of Commerce, Accounts and Finance. Wall Street speculation absorbed "a great deal of time, interest and thought on the part of business men, bankers, professional men and wage earners whose daily pursuits are far removed from stock market affairs."

Another favorable factor, commonly mentioned as likely to offset curtailment of buying power traceable to Wall Street losses, is the easing of money rates, However, the *Guaranty Survey*, published by the Guaranty Trust Co., New York, believes that the importance of ample credit has been overemphasized.

Easier Money Not a Primary Stimulant

"Just as business during the last two or three years has not been seriously hampered by the advance in interest rates, so a period of easier money will not, by itself, create a business revival. The influence of interest rates on most branches of business is negative rather than positive. When recovery occurs, however, the abundance of funds available at low rates will be a stimulating factor."

Actual Wall Street losses, in the view of the *Survey*, were probably exaggerated, but there is no point in calling attention to the obvious fact that no physical wealth was destroyed in the market convulsion.

"Business reactions," the *Survey* adds, "are caused by the destruction not of physical wealth but of dollar values; and so long as wealth and incomes are measured in terms of dollars, to belittle the destruction of such values as a mere bookkeeping sleight-of-hand does not diminish its importance."

Iron and Steel Markets

Further Reduction in Output

Pig Iron and Steel Producers Curtail in Step with Receding Specifications—Approach of Inventory Period Is a Factor Restricting Releases

IRON and steel production has undergonea further decline in conformity with receding specifications. Retarded recovery of the automotive industry, approaching year-end inventories and the usual caution of buyers in a quiet market have all contributed to the slowing up of demand.

Doubtless many users are also delaying purchases until they can obtain a better appraisal of the effect of the stock market crash on ultimate consumption and thereby secure an estimate of their future requirements. Few cancellations are reported by steel producers, but specifications in some instances have been pared down or entirely suspended. An offsetting influence is the reinstatement of orders held up several weeks ago.

With current market factors discouraging the placing of new business and adding emphasis to the importance of cutting down inventories, it is difficult to get a satisfactory measure of steel consumption. Meanwhile steel producers are keeping finishing mill schedules in the closest possible adjustment with bookings, although here and there moderate stocks of standard sizes of bars are being accumulated.

Purchases of steel by the automotive industry for new models have not developed in any great volume and no marked improvement in shipments to motor car builders is looked for this year. Independent Cleveland mills, which depend on automobile manufacturers for a larger portion of their tonnage than producers in most other districts, have reduced operations to 35 per cent of ingot capacity. Youngstown output has been interrupted recently by complete shutdowns of a number of open-hearth plants, but is now estimated at 40 to 50 per cent. The average for the Pittsburgh district has declined to 65 per cent and the Chicago rate, notwithstanding expanding rail operations, has receded to 70 per cent. Steel Corporation subsidiaries are running at 68 per cent of capacity, compared with 72 to 74 per cent a week ago, while the average for Bethlehem plants is 70 per cent.

Railroad equipment business is featured by an order placed by the St. Louis-San Francisco for 3800 freight cars, requiring 40,000 tons of steel. Fresh inquiries call for 2700 cars. Both rolling stock builders and farm implement makers continue to operate at a high rate, but the former are holding down their current specifications for steel as a pre-inventory precaution.

Steel fabricating shops also remain active, with new demand for structural projects developing in a promising manner. Work that came out for bids during the week totaled 65,000 tons, although lettings, at 22,000 tons, were only half those of the previous week. Approximately half of the new tonnage that came into the market was for two Chicago projects—an addition to the Chicago *Tribune* Tower, 17,000 tons, and an addition to the Morrison Hotel, 15,000 tons. Construction prospects in the Lake Michigan city are considered excellent, in view of the reopening of plans that have lain dormant for a year or more, but most of this work will not reach the contracting stage until after the turn of the year.

Rail production at Chicago is now above 85 per cent of capacity. A Western road has bought 7500 tons, and the Missouri-Kansas-Texas is in the market for 8000 tons. The Southern Pacific has not yet taken action on its inquiry for 120,000 tons of rails, but has distributed orders for 14,000 tons of tie plates. The New York Central will shortly buy 35,000 tons of track supplies.

Tin plate output has improved slightly, with the leading interest operating at more than 75 per cent and independents running at somewhat above 60 per cent of capacity. Large tin plate contracts for the first half of 1930 have been placed, and indications are that the requirements of can companies will be fully as large as for the comparable period this year.

Buyers of other forms of finished products are manifesting virtually no interest in first quarter contracts. With spot business also light, prices are flexible but, on the whole, have undergone few severe tests.

Scrap markets have grown still weaker, with heavy melting steel down 50c. a ton at Pittsburgh, Chicago and Philadelphia and with reductions the rule in practically all other grades.

Curtailment of pig iron shipments has extended to melters outside of the automobile industry and a further decline is expected in December, with the approach of inventory taking. With demand diminishing, producers continue to reduce operations rather than to stock iron. One furnace has gone out at Cleveland, three at Buffalo, and two in the Pittsburgh district. Buffalo foundry iron for delivery along the Eastern seaboard has declined to $17, furnace, a drop of 50c. a ton.

Exports of iron and steel in October, 247,646 tons, showed a gain of 11½ per cent over the previous month, but a reduction of 4 per cent from the total for October, 1928.

THE IRON AGE composite price for pig iron has declined to $18.29 a gross ton from $18.38, its level in the preceding five weeks. A year ago it stood at $18.59. The finished steel composite is unchanged at 2.362c. a lb., the same figure as 12 months ago.

On export business there are frequent variations from the above prices. Also, in domestic business, there is at times a range of prices on various products, as shown in our market reports on other pages.

Pittsburgh

Steel and Pig Iron Curtailed in Keeping with Demands—No Sustained Improvement Expected Before January

PITTSBURGH, Nov. 26.—Pittsburgh steel producers continue to fortify their position with curtailed production of basic materials and the closest possible adjustment of finishing mill schedules to current demand. Two integrated independent steel companies have blown out blast furnaces in the last week and production of open-hearth steel is still declining.

The principal Steel Corporation subsidiary and the leading independent company in this district are now the only interests which are operating more than half of their available open-hearth furnaces, while production in the Youngstown and Wheeling districts is even more drastically curbed. However, with the two leading interests in the immediate Pittsburgh area running at 70 per cent, or slightly better, the average ingot operating rate is not below 65 per cent of capacity and possibly not far below 70, the estimated rate in the previous week.

In some cases, finishing mills are running this week at a better rate than open-hearth furnaces. This is particularly true in the Youngstown district, but in that locality many sheet and strip units were down in the previous week and orders had accumulated. Finishing mill schedules are so closely adjusted to tonnage releases that operations are now figured in days rather than weeks by many companies. But the demand of consumers is urgent enough to justify this situation and shipping departments find their duties as exacting as in times of very heavy production.

Steel demand shows no definite trend. A company which was agreeably surprised by the volume of specifications in the week before last was astonished just as much by the sharp decline last week. In other cases the reverse is true, and it now seems certain that demand will see no sustained improvement before the first of the year. The extent of such an improvement is not so well defined, but when year-end inventories are completed steel releases are not expected to be so restrained. Consumers will also have had more opportunity to gage the full effect of the recent stock market collapse on the country's ultimate buying power and thus place some estimate upon their 1930 requirements.

Steel buyers are still very apathetic toward their usual first quarter contracts, and here again makers expect little interest before the end of the year. Many users will still have considerable tonnage coming to them on present contracts at the end of December and makers will be in no hurry to cancel such obligations and run the risk of making new contracts at possibly reduced prices.

Makers of wire products and strip steel have already opened their books for first quarter at unchanged prices and at least one sheet producer has followed suit. In this case, however, the prices asked are the maximum figures now quoted and are scarcely representative of the true market.

No announcement has been made regarding the heavy hot-rolled products, but the present 1.90c., Pittsburgh, quotation will probably be reaffirmed. In fact, the extension of present quotations on all products is

about the only policy which could be followed, as an advance would be out of the question and a reduction not to be desired.

Pig Iron.—Buying shows no improvement and shipments are declining somewhat more rapidly than they were earlier in the month. Many companies are beginning to reduce their requirements preparatory to year-end inventory taking, which in some cases will extend over a two-week period during the latter part of December. Generally speaking, consumers' stocks are normally low at this time of the year, and pig iron makers are not surprised at the added caution now being shown by most buyers. However, reduction in pig iron consumption has not taken place any more rapidly than production, and none of the important merchant interests is stocking iron. The Pittsburgh Crucible Steel Co., an occasional seller of basic iron, has blown out one of its furnaces at Midland, Pa., and the Pittsburgh Steel Co. has taken out a furnace at Monessen. The latter company seldom, if ever, is a factor in the merchant pig iron market. In the absence of buying, excepting in carload lots, pig iron prices are holding at $18.50, Valley, for foundry and basic, and $19 for malleable and Bessemer. The Pittsburgh furnace is quoting prices 50c. over these figures. All of these prices, however, are more or less nominal and will probably not stand the test of large tonnage buying. At least, this is the opinion of a number of producers as well as consumers.

Prices per gross ton, f.o.b. Valley furnace:

Basic	$18.50
Bessemer	19.00
Gray forge	18.00
No. 2 foundry	18.50
No. 3 foundry	18.00
Malleable	19.00
Low phos., copper free	27.00

Freight rate to Pittsburgh or Cleveland district, $1.76.

Prices per gross ton, f.o.b. Pittsburgh district furnace:

Basic	$19.00
No. 2 foundry	19.00
No. 3 foundry	18.50
Malleable	19.50

Freight rates to points in Pittsburgh district range from 63c. to $1.13.

Semi-Finished Steel.—Spot sales are uncommon, and, with many contract users gradually curtailing their requirements, the market is extremely dull. Most users who do not make their own steel have enough tonnage contracted for to last until January, and are in no hurry to extend their commitments. In view of this, sellers have not opened their books for first quarter, and are not sure just what the price will be at that time. The present quotation of $35, Pittsburgh or Youngstown, for billets, slabs and sheet bars is getting no test, but even sellers are willing to admit that the figure would show little strength on any substantial tonnage. Forging billets are nominally quoted at $40, Pittsburgh, but demand is light. Wire rods are unchanged at the same figure, and some producers have opened their books for first quarter. As yet consumers are not interested in material for that period.

Bars, Shapes and Plates.—Demand for bars is extremely dull, and with some companies is still tapering off rather than increasing. Such consumers as farm implement and machinery builders are taking a fair tonnage, but other large consuming lines have practically cut off shipments. In no cases are cancellations reported, but suspensions are in effect on considerable tonnage, the release of which would stimulate mill schedules considerably. Reinforcing bar awards have declined seasonably, although shipments are still being made on some projects let earlier in the year. Structural awards in the immediate Pittsburgh district are very light, but fabricators here are engaged on large projects let during the summer, and some have ahead of them from three to four months of comparatively heavy operations. This is keeping shape mills well occupied. Demand for plates is not as good as it should be, considering the large car awards placed recently with builders served by this district. However, this tonnage is bound to reach the mills sooner or later, and the continued demand for rolling stock by the carriers is very beneficial to general feeling in the industry. The Chesapeake & Ohio and the Pere Marquette are expected to enter the market this week for about 10,000 freight cars, and other large inquiries are said to be forthcoming in a short time. The barge business is not active, and some yards are badly in need of orders. Others have backlogs which will keep them busy well into January. Talk of heavy barge buying in this district persists, but is not yet backed up by formal inquiry from any of the proposed buyers. Prices on bars, shapes and plates are not strong, but few concessions from the quoted figure of 1.90c., Pittsburgh, are reported. Although mills have not yet opened their books for the first quarter, some of them believe that the 1.90c. price will be reaffirmed for that period.

Rails and Track Accessories.—The market is not particularly active, but most makers feel that the conference of railroad executives last week will undoubtedly serve to stimulate buying on the part of carriers. Rail mill operations are being improved gradually, and as deliveries are made to the railroads specifications for track accessories naturally improve.

Wire Products.—The opening of books for first quarter on wire and wire nails by leading makers has not served to stimulate business, as most users have their requirements for the remainder of the year contracted for, and with some material not to be shipped until late in December, they would not be faced with any shortage until well into January. Demand for manufacturers' wire is not very good, but the present price of 2.40c. a lb., Pittsburgh, is fairly well established. Jobbers are being quoted $2.40 to $2.50 a keg on nails, and 2.55c. to 2.65c. a lb. on annealed wire, but their stocks are ample and there is little buying.

Tubular Goods.—Pipe demand has recovered slightly in the last week or two, but is still considerably behind that of October. On butt-well material this might be expected on account of the usual seasonal trend, but some lap-weld projects have undoubtedly been held up because of the uncertainty of the general business situation. Among these is the proposed gas line from the Texas fields into Chicago, which now seems to have been postponed until spring. How-

30-lb. coating I.C.	16.80
40-lb. coating I.C.	18.80

Alloy Steel Bars

(F.o.b. makers' mill)

Alloy Quality Bar Base, 2.65c. per Lb.

S.A.E. Series Numbers		Alloy Differential
2000	(½% Nickel)	$0.25
2100	(1¼% Nickel)	0.55
2300	(3½% Nickel)	1.50
2500	(5% Nickel)	2.25
3100	Nickel Chromium	0.55
3200	Nickel Chromium	1.35
3300	Nickel Chromium	3.80
3400	Nickel Chromium	3.20
4100	Chromium Molybdenum (0.15 to 0.25 Molybdenum)	0.50
4100	Chromium Molybdenum (0.25 to 0.40 Molybdenum)	0.70
4600	Nickel Molybdenum (0.20 to 0.30 Molybdenum, 1.25 to 1.75 Nickel)	1.05
5100	Chromium Steel (0.60 to 0.90 Chromium)	0.35
5100	Chromium Steel (0.80 to 1.10 Chromium)	0.45
5100	Chromium Spring Steel	0.20
6100	Chromium Vanadium Bars	1.20
6100	Chromium Vanadium Spring Steel	0.95
9250	Silicon Manganese Spring Steel (flats)	0.25
	Rounds and squares	0.50
	Chromium Nickel Vanadium	1.50
	Carbon Vanadium	0.95

Above prices are for hot rolled steel bars, forging quality. The differential for cold-drawn bars is ¾c. a lb. higher, with standard classification for cold-finished alloy steel bars applying. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis.

Billets under 4 x 4 in. carry the steel bar base. Slabs with a sectional area of 16 in. or over carry the billet price. Slabs with sectional area of less than 16 in. or less than 2½ in. thick, regardless of sectional area, take the bar price.

Rails

	Per Gross Ton
Standard, f.o.b. mill	$43.00
Light (from billets), f.o.b. mill	36.00
Light (from rail steel), f.o.b. mill	34.00
Light (from billets), f.o.b. Ch'go mill	36.00

Track Equipment

	Base per 100 Lb.
Spikes, ⅝ in. and larger	$2.80
Spikes, ½ in. and smaller	2.80
Spikes, boat and barge	3.00
Tie plate, steel	2.15
Angle bars	$2.75
Track bolts, to steam railroads	$3.80 to 4.00
Track bolts, to jobbers, all sizes, per count	70 per cent off list

Welded Pipe

Base Discounts, f.o.b. Pittsburgh District and Lorain, Ohio, Mills

Butt Weld

Steel Inches	Black	Galv.	Iron Inches	Black	Galv.
⅛	45	19½	¼ and ⅜	+11	+36
¼ to ⅜	51	25½	½	23	5
½	56	42½	¾	28	11
¾	60	48½	1 and 1¼	31	15
1 to 3	62	50½	1½ and 2	35	18

Lap Weld

2	55	43½	2	23	9
2½ to 6	59	47½	2½ to 3½	28	13
7 and 8	56	43½	4 to 6	30	17
9 and 10	54	42½	7 and 8	29	16
11 and 12	53	40½	9 to 12	26	11

Butt Weld, extra strong, plain ends

⅛	41	24½	¼ and ⅜	+13	+48
¼ to ⅜	47	30½	½	23	7
½	53	42½	¾	28	12
¾	58	47½	1 to 2	34	18
1 to 1½	60	49½			
2 to 3	61	50½			

Lap Weld, extra strong, plain ends

2	53	42½	½	29	18
2½ to 4	57	46½	2½ to 4	34	20
4½ to 6	56	45½	4½ to 6	33	19
7 to 8	52	39½	7 and 8	31	17
9 and 10	45	32½	9 to 12	21	8
11 and 12	44	31½			

On carloads the above discounts on steel pipe are increased on black by one point, with supplementary discount of 5%, and on galvanized by 1½ points, with supplementary discount of 5%. On iron pipe, both black and galvanized, the above discounts are increased to jobbers by one point with supplementary discounts of 5 and 2½%.

Note.—Chicago district mills have a base two points less than the above discounts. Chicago delivered base is 2½ points less. Freight is figured from Pittsburgh, Lorain, Ohio, and Chicago district mills, the billing being from the point producing the lowest price to destination.

Boiler Tubes

Base Discounts, f.o.b. Pittsburgh

Steel		Charcoal Iron	
2 in. and 2¼ in.	38	1½ in.	1
2½ in.—2¾ in.	46	1⅞ in.	8
3 in.	52	2 in.—2¼ in.	13
3¼ in.—3¾ in.	54	2½ in.—2¾ in.	16
4 in.	57	3 in.	17
4½ in. to 6 in.	46	3¼ in. to 3½ in.	18
		4 in.	20
		4½ in.	21

On lots of a carload or more, the above base discounts are subject to a preferential of two fives on steel and of 10 per cent on charcoal iron tubes. Smaller quantities are subject to the following modifications from the base discounts:

Lap Welded Steel—Under 10,000 lb., 6 points under base and one five; 10,000 lb. to carload, 4 points under base and two fives. Charcoal Iron—Under 10,000 lb., 2 points under base; 10,000 lb. to carload, base and one five.

Standard Commercial Seamless Boiler Tubes

Cold Drawn

1 in.	61	3 in.	46
1¼ to 1½ in.	53	3¼ to 3½ in.	48
1¾ in.	37	4 in.	51
2 to 2¼ in.	32	4½, 5 and 6 in.	40
2½ to 2¾ in.	40		

Hot Rolled

2 and 2¼ in.	38	3¼ to 3½ in.	54
2½ and 2¾ in.	46	4 in.	57
3 in.	52	4½, 5 and 6 in.	46

Beyond the above base discounts a preferential discount of 5 per cent is allowed on carload lots. On less than carloads to 10,000 lb., base discounts are reduced 4 points with 5 per cent preferential; on less than 10,000 lb., base discounts are reduced 6 points, with no preferential. No extra for lengths up to and including 24 ft. Sizes smaller than 1 in. and lighter than standard gage take the mechanical tube list and discounts. Intermediate sizes and gages not listed take price of next larger outside diameter and heavier gage.

Seamless Mechanical Tubing

	Per Cent Off List
Carbon, 0.10% to 0.30%, base (carloads)	55
Carbon, 0.30% to 0.40% base	50

Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.

ever local mills are still getting some business for feeder lines and the demand for seamless tubing from the oil country has not been curtailed noticeably in recent weeks. Distributers' stocks in the oil region are ample in most cases and the present tendency is toward reduction. Mechanical tubing is rather quiet. The airplane industry, which is a large consumer of this material, is said to be buying more conservatively than in the past.

Cold-Finished Steel Bars.—No improvement in demand is reported and shipments are lower than they have been in several months. Agricultural implement makers served by mills in this district are busy and their expected requirements indicate that they expect next year's business to be fully equal to this year's. The automobile industry has shown little interest in its first quarter requirements, although some mills are willing to quote for that period at the present price of 2.20c., Pittsburgh.

Sheets.—Business has registered no additional falling off in the last week, and, although the operations of some mills are slightly lower, improved schedules of some of the larger interests have offset this reduction. The average operating rate for the sheet industry is still somewhat under 60 per cent of capacity. Such a figure must necessarily be rather indefinite, for most of the current estimates are made on the basis of expected operating rates for the week collected on Monday and actual performance sometimes varies as much as 10 points from preliminary estimates. In most cases such variations are on the minus side, but occasionally there is an improvement. A few mills are benefiting from heavier specifications from their Canadian customers, as a change in tariff regulations, effective early in January, will add from $2 to $4 a ton to the prices Canadian consumers must pay for their sheets and tin plate. Otherwise export business is about the same as usual, although tin plate demand from this source seems to be better than usual. The automobile industry is still rather indifferent regarding its future requirements and most of the larger companies are hesitant in announcing production schedules. This does not prevent them from pressing for lower prices and the 4c., Pittsburgh, price on automobile body sheets is still subject to considerable pressure. With mills making this product not operating at more than 40 per cent of capacity, the urge to take tonnage at a lower figure would seem to be rather strong, but thus far leading producers are not shading the price promiscuously. Sheet prices in general are no weaker than they have been and on blue annealed sheets and light plates prices seem slightly stronger than they were a few days ago. A price of 2.70c., Pittsburgh, on black sheets is still heard occasionally, but the general market is still 2.75c. On metal furniture material, prices range from 4c. to 4.10c.

Tin Plate.—Tin plate makers are closing contracts for next year with their regular customers and report little difficulty with regard to tonnage or price. Can manufacturers evidently expect a 1930 business fully equal to this year's. Many of the leading tin plate manufacturers are increasing operations slightly this week and the leading interest expects to run its mills at better than 75 per cent. Independent companies average slightly better than 60 per cent.

Strip Steel.—The strip business is still exceedingly dull. If companies increase operations this week, it is probably because they failed to operate at all last week. Such a condition is true with most companies, and the average operating rate for the industry is between 20 and 30 per cent of theoretical capacity. Cold mills are not so well occupied as hot mills. Specifications are naturally very light under such circumstances and mills are having little or no opportunity to quote on new business. Some of the automobile manufacturers are mildly interested in their future requirements, but they are exerting pressure on current prices and mills are not anxious to commit themselves at lower figures than the present when there is no certainty that the tonnage will be taken out in the near future. There is little or no interest in first quarter tonnage, although practically all makers have opened their books for that period at the present quotations of 2.75c., Pittsburgh or Cleveland, for cold-rolled strip and 1.90c. and 2c., Pittsburgh, on hot-rolled.

Coal and Coke.—Furnace coke is finding little or no demand, and as production has not declined as rapidly as consumption, prices are very weak. The market is no longer quotable at higher than $2.65, Connellsville, and business has been taken at lower figures. Colder weather during the last week has stimulated the demand for heating coke slightly, but the foundry grade is still very quiet and many consumers have suspended shipments for considerable periods. Domestic coal is seasonably active, but declining industrial consumption is having an adverse effect upon the market.

Old Material.—The scrap market is even duller than it was last week, if this condition could be possible, and in the absence of mill buying as well as sustained purchases by dealers, it is very difficult to arrive at quotations which might stand the test of buying or selling. Heavy melting steel is being offered to mills at $15.50, which probably represents the lowest figure freely quoted. Dealers are paying $15 for this grade of scrap, and distress tonnages have been moved at much lower figures. In view of these conditions, the No. 1 grade is apparently 50c. weaker than it was last week, and quotable at $15 to $16. A market for hydraulic compressed sheets is also lacking, but tonnage from the East is being offered at low figures in this district, and dealers are able to buy in that territory for low Pittsburgh delivered prices. Detroit scrap is also becoming a factor in this market, as boat movement is just about ended for this year, and bidding at the leading automobile plants is very weak. Specialties apparently are the only grade of scrap for which there is any demand. Steel foundries are still calling for this material, and the market is not quotably lower. Machine shop turnings have no strength, and the same might be said of the blast furnace grades, for which demand is decreasing as furnaces are taken off. The monthly list of the Baltimore & Ohio Railroad, which closes on Dec. 3, contains 16,500 tons, including 4500 tons of No. 1 heavy melting steel.

Warehouse prices, f.o.b. Pittsburgh

	Base per Lb.
Plates	3.00c.
Structural shapes	3.00c.
Soft steel bars and small shapes	2.90c.
Reinforcing steel bars	2.75c.

Ingot Output Declines as Finished Steel Specifications Continue to Taper—Another Blast Furnace Blown Out

CHICAGO, Nov. 26.—Specifications for finished steel have not been in sufficient volume to support ingot output at the rate of a week ago, and, as a result, operations in this district are not above 70 per cent of capacity. Releases against rail contracts are larger, now being near the rate usually expected at the end of the year, but even this favorable turn is not enough of a factor to balance the lighter demand from the general trade.

No. 5 furnace at South Works has been blown out, leaving 23 steel mill stacks in blast of 36 in the district.

Releases from a wide range of consumers are spotty, and most finishing mills are operating on uncertain schedules that offer no forecast as to output that can be expected next week. This situation is favorable to prompt delivery and closer cutting of stocks by consumers.

One independent producer has accumulated a satisfactory stock of pig iron and, in the absence of a supporting steel market, is considering blowing out a blast furnace.

The impression is widespread here that improvement in building construction cannot be expected until the turn of the year. Numerous sizable projects have taken shape, and easier money rates are bringing to light again a round tonnage in plans which have been dormant for a year or more. Civic improvements and the World's Fair at Chicago are also counted on to add life to this market.

The railroad equipment market remains active, and prospects for the development of new business are good. However, car builders, like other consumers, are cautious in the matter of carrying excessive stocks at the end of the year and, as a result, specifications for car material are not supporting mill operations as had been the hope.

Pig Iron.—Although there has been some shifting in demand for Northern foundry iron, the total of all shipments in the week has held steady at the rate of the first half of the month. Shipping instructions are larger than on Nov. 1 and give promise that in nearby weeks deliveries will approximate local furnace output. Interest thus far shown in future needs is almost wholly confined to the larger consumers. The relatively high rate of demand this month raises the hopes of sellers that total shipments this year will come close to the record set in this district in 1926. Southern interests are asking $13.50 a ton, Birmingham. This price lacks a real test other than that a Michigan melter has taken an option, which expires Dec. 2, on 2500 tons. An Illinois inquiry calls for 500 tons.

Prices per gross ton at Chicago:

N'th'n No. 2 fdy., sil. 1.75 to 2.25	$20.00
N'th'n No. 1 fdy., sil. 2.25 to 2.75	20.50
Malleable, not over 2.25 sil.	20.00
High phosphorus	20.00
Lake Super. charcoal, sil. 1.50	27.04
So'th'n No. 2 fdy. (all rail)	$19.01 to 19.51
Low phos., sil. 1 to 2, copper free	29.50
Silvery, sil. 8 per cent	$28.79 to 29.79
Bess. ferrosilicon, 14-15 per cent	46.29

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Ferroalloys.—This market is quiet. Next year's prices have not been announced on 50 per cent ferrosilicon and spiegeleisen. Forward buying of ferromanganese has made no headway.

Prices delivered Chicago: 80 per cent ferromanganese, $112.56; 50 per cent ferrosilicon, $83.50 to $88.50; spiegeleisen, 19 to 21 per cent, $39.76 to $41.76.

Rails and Track Supplies.—Chicago district rail mills have again stepped up output, which now is close to the range which producers normally expect at the turn of the year. A Western railroad has ordered 7500 tons of standard-section rails. It is reported here that the Southern Pacific, which has had an inquiry in the market for 120,000 tons of rails, has not definitely placed this tonnage. Miscellaneous orders for track fastenings total 6000 tons and fresh inquiry for 35,000 tons by the New York Central is before the trade. In past years about 50 per cent of the New York Central tonnage has been taken by Western mills.

Prices f.o.b. mill, per gross ton: Standard section open-hearth and Bess. rails, $43; light rails, rolled from billets, $36. *Per lb.:* Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.07½c. to 2.15c.; angle bars, 2.75c.

Sheets.—Current quotations are holding well in a market which is characterized by small-lot buying in light aggregate tonnage. Consumers are closely watching the trend of business and also are holding stocks to a low point as the inventory period approaches. This situation is reflected favorably in warehouse business. Deliveries from mills range from seven to 10 days for blue annealed sheets and from two to three weeks for the galvanized and black commodities. Producers are not optimistic over the course which they believe the market will follow in the next few weeks, but they feel that once the inventory period is past the condition of stocks in consumers' hands will force larger orders. Several manufacturers of agricultural machinery have entered the market for tonnages which will be used on equipment now being produced, but which will not be delivered until spring. Hot mill operations in this district range from 50 to 55 per cent of capacity.

Base prices per lb., deliv'd from mill in Chicago: No. 24 black sheets, 2.90c.; No. 24 galv., 3.55c. to 3.65c.; No. 10 blue ann'l'd, 2.35c. Deliv'd prices at other Western points are equal to the freight from Gary, plus the mill prices, which are 5c. per 100 lb. lower than Chicago delivered prices.

Cast Iron Pipe.—Of special interest in this market is an inquiry by Detroit for about 6500 tons of large size cast iron pipe. Bids will be opened Dec. 2 on 1500 tons of 24-in., 2160 tons of 36-in. and 2900 tons of 42-in., all Class C pipe. Avon, Ohio, will soon be in the market for 11,000 ft. of 6-in. pipe. Among public lettings, which are unusually light, is 100 tons let by Dearborn, Mich., to the American Cast Iron Pipe Co. Notwithstanding the dullness of this market, several producers of cast iron pipe report satisfactory operations, with November shipments running close to the rate in the same month a year ago. Here and there is a bright spot, though most sellers agree that they can hope for little this year unless public utilities make purchases in December. Current quotations are holding on odd lots. No word has come whether winter buying prices will be named. A number of municipalities in northern Ohio have voted favorably this fall on projects which will call for sizable tonnages of cast iron pipe. This work will get under way in the spring. In the immediate Chicago district there is no encouragement beyond several requests for prices for estimating purposes.

Prices per net ton, deliv'd Chicago: Water pipe, 6-in. and over, $43.70 to $45.70; 4-in., $47.70 to $49.70; Class A and gas pipe, $3 extra.

Cold-Rolled Strip Steel.—Demand remains light and output is not above 20 per cent of capacity. Prices locally remain steady at 2.75c. a lb., Cleveland, or 3.05c., delivered Chicago. From the viewpoint of use of cold-rolled strip, there is little encouragement to be had from manufacturers of automobiles.

Semi-Finished Steel.—Rerolling billets, 4 in. and under 10 in., are being quoted at $36 a gross ton, Chicago. Demand for semi-finished steel is light.

Warehouse Prices, f.o.b. Chicago

	Base per Lb.
Plates and structural shapes	3.10c.

Com. wire nails, base per keg	$2.75 to 2.95
Cement c't'd nails, base per keg	2.75 to 2.95

Structural Material.—Chicago fabricators are pinning their hopes on business which they expect will come soon after the first of the year. Two projects, which it now appears will come out for figures in January, are the *Tribune* Tower, which will require close to 17,000 tons of steel, and an addition to the Morrison Hotel, Chicago, which will call for about 15,000 tons. Contracts this week were few and for individually small tonnages, mostly from the railroads. Close to 15,000 tons of steel will be needed for new power plant construction in Oklahoma, Minnesota, Illinois and Texas. The promise of easier money is resulting in the resuscitation of old plans, some of which were prepared a year or more ago. Among local improvement jobs being counted on for Chicago are the outer bridge across the Chicago River and a subway.

Mill prices on plain material, per lb.: 2.00c. base, Chicago.

Bars.—Backlogs of mild steel bars are of moderate size and deliveries are prompt. Manufacturers in general continue to take small quantities. Agricultural machinery manufacturers are holding to a high rate of output and road machinery builders are finding larger use for steel. Demand for alloy steel bars is at a low but steady rate. The iron bar market is without feature. New orders for rail steel bars show improvement after a week in which demand was unusually dull. Numerous users in the bed and barn equipment trade have found stocks too low to meet late fall needs and they have entered liberal specifications. Prices at 1.90c. a lb., Chicago Heights, lack strength.

Reinforcing Bars.—New contracts show a substantial gain. This business comes at a time when shipments are tapering and shop operations are going to lower levels. Few new inquiries are before the trade. Competition for going tonnages remains keen, and prices below current quotations have been made. Dealers are basing their views of the immediate future on the number of old quotations, many of which are ready to be closed as soon as financial matters can be arranged. There is promise that money for building purposes will soon be available in more liberal quantities. Several large warehouses report shipments in the first 10 months of 1929 at practically the same tonnage as was moved in the corresponding part of 1928. However, figures now at hand show that building permits in Chicago in the past 10 months are 33 per cent below the total in the corresponding period a year ago, whereas the average drop for 20 cities throughout the country is only 7 per cent.

Plates.—Information more definite than that available a week ago shows that the tonnage of steel pipe reported as having been placed by a California company was in fact a release of an old contract which had been temporarily suspended during changes in plans. The alterations had to do principally with a change in diameter from 22 in. to 26 in. The order now calls for 63,000 tons of 26-in. pipe. Early shipments against this contract are expected by the purchaser, and plate orders placed at local mills have materially strengthened the position of producers. More than 40,000 tons of steel will be needed for the 3500 cars ordered this week by the St. Louis-San Francisco. It is reported that the Rock Island will place contracts for cars this week and that the Louisville & Nashville has authorized the expenditure of upward of $5,000,000 for new equipment to be delivered in 1930. St. Louis-San Francisco plans to build 300 cars in its own shops and the Missouri-Kansas-Texas will build 500 cars. Current specifications from car shops are steady, but there is not the disposition to take increased tonnages in accordance with large contracts recently placed. In some quarters it is believed the car shops desire to hold accounts payable as low as possible to the end of the year and therefore releases for much of the steel needed for new car contracts will not be forthcoming until after the start of the new year. Plate deliveries are prompt on most sizes.

Bolts, Nuts and Rivets.—Demand for these commodities is unchanged as to volume, but specifications are more spotty than a week ago. Farm implement manufacturers still give the greatest support to this market. Railroad and car builders' needs are also in good volume. Jobbers are distributing large quantities, as many consumers turn to this source for small supplies at frequent intervals.

Coke.—All ovens in this district are lighted, and shipments are at the rate of capacity output. Forward contracting continues to make headway. The price is firmly established at $8 a ton, f.o.b. local ovens. By-product foundry coke delivered in Chicago is being quoted at $8.75 a ton.

Old Material.—The insistence of buyers for lower prices is again reflected in current quotations for scrap iron and steel. About 15,000 tons of heavy melting steel has been taken by consumers at $13 a gross ton, delivered, a drop of 50c. in the week. Dealers find supplies free at $12.50 a gross ton. The thought is expressed that yard operators are resisting the low prices, and in some quarters it is expected that present quotations will result in less scrap being prepared by yards. Mills are turning down hydraulic bundles at $11.25 a gross ton, delivered, and brokers are buying this grade freely at $10.50 a ton. Users of cast iron borings are getting ample supplies against old purchases, one melter in the past week having had 65 cars on track in one day. New purchases are lacking, and quotations at $9 to $9.50 a gross ton are nominal. Local production of borings is well below the rate of midsummer, and the bulk of current shipments is coming from outlying points. Dealers look for this market to stiffen with the completion of old orders, when it is thought supplies will be drawn from the limited production of the immediate Chicago territory. Foundries generally are marking time in the matter of purchases, stocks and old orders being ample to meet needs for 30 days. Cold weather of recent days was not of long enough duration to act as a check on the preparation and movement of scrap. The result is incoming shipments are fully ample to meet buyers' needs.

Prices deliv'd Chicago district consumers:

Per Gross Ton

Basic Open-Hearth Grades:	
Heavy melting steel	$12.50 to $13.00
Shoveling steel	12.50 to 13.00
Frogs, switches and guards, cut apart, and misc. rails	13.00 to 13.50
Hydraul. compressed sheets	10.75 to 11.25
Drop forge flashings	9.75 to 10.25
No. 1 busheling	11.50 to 12.00
Forg'd cast and r'l'd steel carwheels	17.50 to 18.00
Railroad tires, charg. box size	17.50 to 18.00
Railroad leaf springs cut apart	17.50 to 18.00
Acid Open-Hearth Grades:	
Steel couplers and knuckles	16.00 to 16.50
Coil springs	18.00 to 18.50
Electric Furnace Grades:	
Axle turnings	12.75 to 13.25
Low phos. punchings	15.00 to 15.50
Low phos. plates, 12 in. and under	14.75 to 15.25
Blast Furnace Grades:	
Axle turnings	10.50 to 11.00
Cast iron borings	9.00 to 9.50
Short shoveling turnings	9.00 to 9.50
Machine shop turnings	6.50 to 7.00
Rolling Mill Grades:	
Iron rails	14.50 to 15.00
Rerolling rails	15.00 to 15.50
Cupola Grades:	
Steel rails less than 3 ft.	16.25 to 17.25
Steel rails less than 2 ft.	18.00 to 18.50
Angle bars, steel	15.25 to 15.75
Cast iron carwheels	13.50 to 14.00
Malleable Grades:	
Railroad	16.00 to 16.50
Agricultural	14.50 to 15.00
Miscellaneous:	
*Relaying rails, 56 to 60 lb.	23.00 to 25.00
*Relaying rails, 65 lb. and heav.	26.00 to 31.00

Per Net Ton

Rolling Mill Grades:	
Iron angle and splice bars	15.00 to 15.50
Iron arch bars and transoms	17.50 to 18.00
Iron car axles	25.50 to 26.00
Steel car axles	15.50 to 16.00
No. 1 railroad wrought	12.00 to 12.50
No. 2 railroad wrought	11.00 to 11.50
No. 1 busheling	9.00 to 9.50
No. 2 busheling	7.00 to 7.50
Locomotive tires, smooth	14.50 to 15.00
Pipes and flues	9.50 to 10.00
Cupola Grades:	
No. 1 machinery cast	13.50 to 14.00
No. 1 railroad cast	12.50 to 13.00
No. 1 agricultural cast	12.00 to 12.50
Stove plate	11.50 to 12.00
Grate bars	11.25 to 11.75
Brake shoes	9.75 to 10.25

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

The Oliver Machinery Co., Grand Rapids, Mich., manufacturer of woodworking machinery and machine tools, has opened a branch office, warehouse and salesroom at 514 Bryant Street, San Francisco, with H. C. Wood as manager. In addition to the line of Oliver machines, the branch will be the Pacific Coast agent for the woodworking machines and tools manufactured by the Buss Machine Works, G. M. Diehl Machine Works, Sheboygan Machine Co., Vonnegut Machinery Co. and the Wilkins-Challoner Co.

New York

Pig Sales About 5000 Tons, Inquiries Light—Steel Orders Show a Slight Improvement

NEW YORK, Nov. 26. — Pig iron sales totaled 5000 tons for the week, and inquiries are light, the largest calling for 1000 tons. Melters are in no haste to cover their forward requirements, but are taking shipments without interruption. Suspensions on account of business conditions have been few and hold-ups because of inventory taking are not looked for until the middle of next month. Melters' stocks are very low and it is almost literally true, in many cases, that pig iron is being unloaded directly from cars into cupolas. Prices have become somewhat easier, with foundry iron rather commonly available at $17 to $17.50, base Buffalo. Producers are taking steps, however, to keep operations in tune with demand. The leading merchant producer in Buffalo blew out a furnace last week and other interests are prepared to curtail output as conditions demand it. The navigation season on the State barge canal is approaching its close and concluding shipments from Buffalo are being made. Buffalo interests have built up the usual stocks at New Jersey ports to take care of the expected winter needs of their customers. Alabama foundry iron continues to reach this district by water, with sellers quoting $19 to $19.50 a ton, delivered on docks at Jersey City, N. J. The Worthington Pump & Machinery Corporation has closed for 1000 tons for its Harrison, N. J., plant, and the New York Air Brake Co. has bought 650 tons for delivery at Watertown, N. Y.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil. 1.75 to 2.25	$21.91 to $22.41
*Buff. No. 2, del'd east. N. J.	20.28 to 20.78
East. Pa. No. 2 fdy., sil. 1.75 to 2.25	$19.89 to 21.02
East. Pa. No. 2X fdy., sil. 2.25 to 2.75	20.39 to 21.52

Freight rates: $4.91 from Buffalo, $1.39 to $2.52 from eastern Pennsylvania.
*Prices delivered to New Jersey cities having rate of $3.28 a ton from Buffalo.

Ferroalloys.—With most large consumers covered by contracts calling for their requirements, new demand for ferromanganese is naturally confined to smaller users. There have been orders from this source for carload and small lots in the past week, with requests for early shipment. Sales have been at the regular price of $105, seaboard. There is also some demand for carload lots of spiegeleisen at regular quotations. It is expected that contracts for 1930 requirements for ferromanganese, ferrosilicon, ferrochromium and spiegeleisen will be negotiated early next month.

Reinforcing Bars.—Although there has been a slackening in demand for reinforcing bars, considerable tonnage is still pending. Nine hundred tons for a subway section should be awarded soon, and the new public library in Brooklyn will require 700 tons. The Turner Construction Co. has the general contract for the Edgewater, N. J., plant of the Ford Motor Co., which will take 1100 tons of bars. Prices are holding fairly well at 2.05c., New York, but concessions are reported to have been made in some cases.

Finished steel—Steel buying in some lines was slightly better in the past week than in the week preceding, a reflection, perhaps, of the fact that many consumers found the ordering of fresh supplies imperative after a period of hesitancy. It is too early, however, to say whether this indicates a definite trend toward improvement. The placing of large tin plate contracts for the first half of 1930 was a conspicuous event of the week, but the improvement of the past week was also in lines other than tin plate. Structural steel lettings continue in fairly large volume, the total for the week being about 11,000 tons in New York and vicinity, including 4000 tons for an apartment building at Madison Avenue and Seventy-sixth Street. Among new projects up for bids is a high school building in the Bronx, calling for 3500 tons. Eastern railroads are not prominent in the railroad equipment market, but inquiries are expected from one or two roads within the next week or two. Car builders estimate that nearly 20,000 cars will come up for bids within a fortnight, in addition to about 8000 on which figures have gone in. Toward the end of December there will be further large inquiries. There are no new developments in the price situation other than further weakness in cold-rolled strip, which is being sold to tube makers and other large consumers at 2.65c., Cleveland or Pittsburgh, although the ordinary buyer is still being asked to pay 2.75c. Structural shapes are quoted at a range of 2.04½c. to 2.14½c., delivered New York. A large maker of structural material states, however, that it has not found it necessary to go below 2.14½c.

Mill prices per lb., deliv'd New York: Soft steel bars, 2.24c.; plates, 2.17½c. to 2.22½c.; structural shapes, 2.04½c. to 2.14½c.; bar iron, 2.14c.

Warehouse Business. — The total tonnage of sales from stock in the current month has been considerably smaller than in October, although the number of orders has continued at about the same level. Since the recent reduction of black sheet prices to 3.90c. a lb., base, and galvanized to 4.50c. a lb., base, concessions have ceased, but blue annealed sheets, which are still quoted at 3.90c. a lb., base, are subject to shading, which brings the price down to 3.50c. a lb. and occasionally lower.

Cast Iron Pipe.—Pressure pipe producers in the Birmingham district are not maintaining better than 40 per cent operation and Northern makers are in need of tonnage in small sizes of pipe, although still moderately well engaged to the end of the year on large sizes. Prices continue irregular, with only small tonnages of water pipe being bought. The Department of Purchase, New York, which has or-

dered pipe rather sparingly this year, compared with the usual requirements of the city, has asked for bids on a lot of less than 100 tons of 16-in. pipe, special fittings and valve box castings. The Federal Water Service Corporation, New York, is about to close on 1100 tons of pipe. The Sinclair Refining Co., New York, is in the market for slightly less than 100 tons of water pipe for Houston, Tex., and the Pan-American Petroleum & Transport Co., New York, is asking for about 120 tons of water pipe for Savannah, Ga.

Prices per net ton deliv'd New York: Water pipe, 6-in. and larger, $34.60 to $36.60; 4-in. and 5-in., $37.60 to $39.60; 3-in., $44.60 to $46.60. Class A and gas pipe $3 extra.

Coke.—Except for the renewal of by-product coke contracts for the first quarter and first half of next year, the market continues quiet. Furnace coke is unchanged at about $2.75 a net ton, Connellsville. Special brands of beehive coke are still quoted at $4.85 a net ton, ovens, or $8.56, delivered to northern New Jersey, Jersey City and Newark, and $9.44 to New York and Brooklyn. By-product foundry coke is quoted at $9 to $9.40 a net ton, Newark or Jersey City, and $10.06, New York or Brooklyn.

Old Material.—Consumer buying of iron and steel scrap has reached the lowest level of the year, and this condition is reflected in a continued downward trend of brokers' buying prices. Brokers have reduced prices on No. 2 heavy melting steel for a Phoenixville, Pa., consumer to $12 a ton, delivered, and a consumer of this grade at Harrisburg has temporarily suspended shipments on its contracts. In the past week a broker has sold a small tonnage of No. 1 machinery cast to a Phillipsburg, N. J., foundry at $14 a ton, delivered. With most consumers of scrap seeking low inventories for the end of the year, sellers of scrap expect a continuation of the present situation into January.

Dealers' buying prices per gross ton, f.o.b. New York:

No. 1 heavy melting steel	$11.00 to $11.35
Heavy melting steel (yard)	8.00 to 8.50
No. 1 hvy. breakable cast.	10.25 to 11.00
Stove plate (steel works)	8.00
Locomotive grate bars	8.25
Machine shop turnings	7.00 to 7.50
Short shoveling turnings	7.25 to 7.50
Cast borings (blast fur. or steel works)	7.00 to 7.50
Mixed borings and turnings	6.75 to 7.50
Steel car axles	15.25 to 16.25
Iron car axles	21.00 to 21.50
Iron and steel pipe (1 in. dia., not under 2 ft. long)	9.75
Forge fire	8.50 to 9.00
No. 1 railroad wrought	12.00 to 12.50
No. 1 yard wrought, long	11.00 to 11.50
Rails for rolling	11.50 to 12.00
Stove plate (foundry)	8.25 to 9.00
Malleable cast (railroad)	13.50 to 14.00
Cast borings (chemical)	9.00 to 9.50
Prices per gross ton, deliv'd local foundries:	
No. 1 machry. cast	$15.00 to $15.50
No. 1 hvy. cast (columns, bldg. materials, etc.), cupola size	13.00 to 13.50
No. 2 cast (radiators, cast boilers, etc.)	12.50 to 13.00

Cleveland

Steel Orders Show Little Change Except for Slight Improvement in Sheets—No Gain in Automotive Tonnage

CLEVELAND, Nov. 26.—Specifications for finished steel showed little change the past week, and mills are operating at about the same schedules as in the preceding week, although some of the sheet mills are doing a little better. As independent Cleveland mills depend on the automotive industry for a larger portion of their business than mills in most other districts, they are feeling probably to a greater extent the slump in that industry and have reduced operations to about 35 per cent of ingot capacity. With inventory time approaching, orders generally are for small lots.

The automotive industry appears to be going along at about the pace set earlier in the month, and specifications from this source continue light. Some bar specifications have been issued for early January shipments. New buying by the automotive industry has not developed in any volume for new models of low-priced cars, makers of some of which are not expected to get started on good production schedules before January.

Some of the local forge shops have orders for automobile forgings that will enable them to maintain fair production schedules in December in making parts that will go in January automobile production.

Local bar mills are in need of orders and have been kept operating to some extent by rolling standard sizes for stock.

A local motor truck manufacturer is maintaining good production schedules. Industries outside the motor car field are still doing fairly well. Many of these had enough business on their books before the stock market collapse to keep them busy for some time.

Present prices on alloy steel bars have been reestablished for the first quarter. A Cleveland mill has opened its books for plates at 1.90c. for that delivery and another is willing to quote the present prices on plates, shapes and bars for the first quarter.

Mills that have reestablished present prices for sheets and strip steel for the first quarter report that buyers are showing no interest in contracts.

Pig Iron.—There is very little buying in any territory served by Cleveland interests, and sales by these producers dwindled to 6250 tons during the past week. These were mostly in small lots for the remainder of the year, although a few orders were taken for the first quarter. Very little interest is being shown in first quarter contracts. With decreased demand, producers are curtailing operations rather than stocking iron. The Corrigan, McKinney Steel Co. blew out one of its Cleveland furnaces for relining during the week and the Hanna Furnace Co. put one Buffalo furnace out of blast and will blow out a second Dec. 1, leaving two in operation. Shipments this month are falling somewhat below those of October and a further decline is looked for in December, as there is usually a slowing down during that month because of approaching inventories. While two or three automotive foundries in Michigan issued releases during the week, these were not sufficient to indicate any definite trend upward in that industry. Considerable iron is being moved this month by boat from Buffalo to Saginaw, Mich., the buyer putting this iron in storage for the winter before the close of navigation. Prices on foundry and malleable iron are untested and unchanged at $18.50, Cleveland, for outside shipment and $19 for local delivery. For Michigan delivery, the range is $19.50 to $20, furnace.

Prices per gross ton at Cleveland:

N'th'n fdy., sil. 1.75 to 2.25	$19.50
S'th'n fdy., sil. 1.75 to 2.25	$19.51 to 20.51
Malleable	19.50
Ohio silvery, 8 per cent	28.00
Basic Valley furnace	18.50
Stand. low phos., Valley	26.50 to 27.00

Prices except on basic and low phosphorus are delivered Cleveland. Freight rates: 50c. from local furnaces; $3 from Jackson, Ohio; $6.01 from Birmingham.

Iron Ore.—Lake shipments are rapidly drawing to a close. Some of the upper Lake ports have sent their last cargoes and others have a few more, which will be dispatched before the end of the week. The water movement this year will exceed by about 350,000 tons the record established in 1916, when shipments by boat amounted to 64,734,198 tons. However, the total movement is expected to run about 500,000 tons less than in 1916, as the all-rail shipments will amount to only about half as much this year as in the record-breaking year, due to the fact that the Mayville, Wis., blast furnace that takes ore by rail is out of blast and the ore for the furnaces at Granite City, Ill., is now being sent by water to Chicago and by rail to destination. The water movement during the first 22 days of November was 3,700,000 tons and the final cargoes will add 100,000 tons or

more to this total. Consumption of Lake ore during October was 5,382,561 tons, an increase of 20,994 tons over September, and as compared with a consumption of 5,024,642 tons in October last year. Furnace stocks Nov. 1 amounted to 34,769,584 tons. The amount on hand at furnaces and Lake Erie docks Nov. 1 was 41,134,926 tons, as compared with 39,554,612 tons on the same date a year ago. Central district furnaces consumed 2,715,170 tons in October, a decrease of 30,454 tons for the month. Lake front furnaces used 2,418,121 tons, an increase of 40,068 tons. Eastern furnaces consumed 120,706 tons, a decrease of 3392 tons, and all-rail furnaces consumed 128,564 tons, an increase of 14,772 tons. There were 180 furnaces using Lake ore in blast Nov. 1, a decrease of six for the month.

Alloy Steel Bars.—The present base price of 2.65c., mill, to round lot users has been named for the first quarter. Differentials are unchanged. Orders are light, but a pick-up is looked for next month, when automobile manufacturers issue specifications for January production.

Bolts, Nuts and Rivets.—Bolt and nut orders showed a decline this month, as compared with October. Demand is slow from all consuming industries and little business is coming from jobbers, who do not usually place orders at this time of the year. It is expected that present prices will be reaffirmed for the first quarter. Rivets are still rather quiet.

Bars, Plates and Shapes.—Structural shapes are in good demand from local fabricating shops that are well filled with small work. A fair volume of new building work is in prospect, as well as a goodly amount of highway bridge construction. Plates are in fair demand from boiler and tank shops. Call for steel bars is very light because of the limited demand from the automotive industry. While 1.95c., Pittsburgh, has not disappeared for small lots, 1.90c. has become the general price for plates and shapes. On steel bars, 1.85c., Cleveland, has become more common. While this is a minimum quotation by outside mills, 1.80c. quotations have appeared.

Semi-Finished Steel.—Specifications are holding up to recent volume, which is around 50 per cent of normal. Shipments of sheet bars, billets and slabs are being made against $35 contracts. There is no new business to test prices.

Sheets.—Operations are a little better this week, some mills having accumulated enough business to increase their schedules. Independent mills are operating at from 40 to 70 per cent. Orders from the automotive industry show no gain. A local plant making bodies for one of the low-priced cars has resumed operations in a limited way, but has held up sheet shipments until Dec. 4. Metal furniture plants are fairly busy, but have good stocks. Conditions in the stove industry are spotty. Prices show little change, although 2.10c., Pittsburgh, for No. 10 light plates and 2.25c. for No. 13 blue annealed have become more common. There are reports of occasional concessions from the 2.75c. price on black sheets. Galvanized sheets are rather commonly quoted at 3.40c.

Strip Steel.—Demand for both hot and cold-rolled strip is still very light. While most mills are maintaining regular quotations on hot-rolled strip, there are reports of concessions. Cold-rolled strip appears firm at 2.75c., Cleveland.

Reinforcing Bars.—Two jobs requiring 2100 tons, an Akron store building and local railroad work, were placed during the week. Prices are soft. Some jobbers, anxious to reduce stocks, are quoting around 2c. or close to the mill price.

Coke.—Ohio by-product coke has been reestablished at $8.25, ovens, for December shipment. Prices on by-product coke for domestic use have declined another 25c. a ton, being back to where they were early in October of $4.75 for egg and $4.50 for nut. The cold spell has stimulated shipments, which for a time were being deferred by dealers. The slowing down of the steel industry is resulting in an increase in the quantity of coke available for the market.

Old Material.—Not much scrap is being shipped to the mills, as very little is being taken by consumers in the Cleveland and Valley districts. Mills outside these districts are taking moderate amounts. Scrap production has decreased almost to the same extent as the demand from mills. Consequently, not a great deal of scrap is backing up or is being forced on the market. When offered at unusually low prices, dealers are buying small lots for yard stocks. Prices are weak, but no lower than a week ago, except on railroad wrought scrap and No. 1 busheling.

Prices per gross ton delivered consumers' yards:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$14.00 to $14.50
No. 2 heavy melting steel	13.50 to 13.75

Philadelphia

Sheet Prices Lack Firmness—Pipe Line Requires 1700 Tons of Plates—Scrap Prices Decline

PHILADELPHIA, Nov. 26.—Steel buying is still limited to carload lots and less, with buyers showing no inclination to foresee future requirements. However, a general improvement in sentiment is evident. November steel business is expected to be the smallest of the year, because of the lack of buying early in the month, following the decline in the stock market. Prices are still slightly irregular, but except for some tendency to increase the concessions offered to preferred buyers of sheets and a general downward trend of iron and steel scrap prices, no definite recession has appeared.

Eastern mills are quoting on 1700 tons of flanged steel plates for a pipe line at Erie, Pa., in addition to a substantial tonnage of ship plates, which will be required by the shipyard receiving award of the two liners, on which the United States Lines opened bids Nov. 22. An order for 40 locomotives has been placed by the Rock Island with the American Locomotive Co.

Pig Iron.—Except for an occasional inquiry for 100 to 200 tons of foundry iron for early shipment, buying is limited to carload lots. Most consumers show no interest in next year's requirements and are concentrating their efforts on reducing existing stocks for year-end inventory. Demand for low phosphorus iron is fair and the price is firm. The Washington Navy Yard is inquiring for 500 tons of low phosphorus and the Brooklyn Navy Yard has not yet awarded 100 tons. About 1000 tons of

cylinder grade iron for the Baldwin Locomotive Works has been placed with a Southern producer. Birmingham foundry iron continues to compete for eastern Pennsylvania business, but on a smaller scale than some months ago. The Virginia furnace interest, which is quoting $17.75 a ton, base, on foundry iron, is seeking business in the Cumberland Valley, but most consumers are covered in their current requirements and are not yet interested in contracting for next year. Basic iron is still quiet.

Billets.—Consumers are reducing their stocks, and in some cases still receiving deliveries on old contracts. In most cases, mills will need billets for first quarter rolling, and some contracting is expected before the end of December. Quotations are unchanged at $35 a ton, Pittsburgh, for rerolling billets and $40, Pittsburgh, for forging quality.

Prices per gross ton at Philadelphia:

East. Pa. No. 2, 1.75 to 2.25 sil.	$21.26 to $21.76
East. Pa. No. 2X, 2.25 to 2.75 sil.	21.76 to 22.26
East. Pa. No. 1X	22.26 to 22.76
Basic (del'd east. Pa.)	19.75 to 20.25
Gray forge	20.00 to 20.50
Malleable	21.25 to 21.75
Stand. low phos. (f.o.b. N. Y. State furnace)	22.00 to 23.00
Cop. br'g low phos. (f.o.b. furnace)	23.50 to 24.00
Va. No. 2 plain, 1.75 to 2.25 sil.	22.29
Va. No. 2X, 2.25 to 2.75 sil.	22.79

Prices, except as specified otherwise, are deliv'd Philadelphia. Freight rates: 76c. to $1.64 from eastern Pennsylvania furnaces; $4.54 from Virginia furnaces.

Bars.—Buying is limited to carload lots, but the price is maintained at 1.90c., Pittsburgh, or 2.22c., delivered Philadelphia.

Reinforcing Bars.—Competition is keen, with only a few projects in the market. Billet steel bars continue at 1.95c. to 2c., Pittsburgh, or 2.22c. to 2.27c., delivered Philadelphia, with the usual $5 extra for cutting to length omitted. Rail steel bars are about 1.85c. a lb., Franklin, Pa., and Tonawanda, N. Y., or 2.17c. a lb., delivered Philadelphia, with no extra for cutting to length. On desirable contracts billet steel bar sellers occasionally meet the rail steel bar price and rail steel bar mills have had to make further concessions to obtain business.

Shapes.—Fabricating shops are well engaged, but are not bidding on much new tonnage. A number of projects in this district have been pending award for some time and are expected to be placed soon. Mills have a fair tonnage of shapes on their books, but prices are still irregular at 1.90c. to 1.95c., f.o.b. nearest mill to consumer, or 1.96c. to 2.01c., delivered Philadelphia. Occasionally lower than 1.90c., f.o.b. mill, is quoted on desirable specifications.

Plates.—Mills are maintaining a fair rate of operation, but new business is rather limited. In addition to a substantial tonnage of ship plates being quoted on for liners pending award, mills are bidding for 1700 tons of flanged steel plates in a pipe line at Erie, Pa. On current small orders, 2.05c. a lb., Coatesville, Pa., or 2.15c. a lb., delivered Philadelphia, is quoted, but on the more substantial tonnages of plates 2c., Coatesville, or 2.10c., Philadelphia, applies.

Sheets.—Local sheet consumers are still operating on restricted schedules, the radio manufacturers having passed the peak of their season of production, and the automobile body builders still await specifications on the new models for which they have contracts. While blue annealed sheets are quoted at 2.35c. a lb., Pittsburgh, or 2.67c., delivered Philadelphia, for No. 13 gage, certain sellers have recently shown an inclination to increase the concession of $2 to $4 a ton, usually granted to the automobile manufacturers. Blue annealed plates, No. 10 gage, are quoted at 2.20c., Pittsburgh, or 2.52c., delivered Philadelphia, with concessions of $2 a ton and more to preferred buyers. Black sheets are quoted at 2.70c. to 2.75c., Pittsburgh, or 3.02c. to 3.07c., Philadelphia, but most of the current buying is at the lower price. Galvanized sheets are moderately firm at 3.40c., Pittsburgh, or 3.72c., delivered Philadelphia.

Imports.—In the week ended Nov. 23, arrivals of ore at this port consisted of 1990 tons of chrome ore from Greece and 765 tons of iron ore from Germany. A total of 1864 tons of pig iron was received, of which 1451 tons was from British India, 263 tons from the United Kingdom and 150 tons from the Netherlands. Steel arrivals consisted of 68 tons of steel billets, 15 tons of steel rods, 24 tons of drill steel and 1 ton of steel bars from Sweden, 21 tons of steel bands from Germany and 506 tons of strip steel from France. Scrap steel arrivals were 32 tons from the United Kingdom and 2 tons from Japan.

Old Material.—Prices on all grades of scrap show further recession, consumers in most cases being willing to buy only at reductions of 50c. a ton or more from the prices previously paid. No. 1 heavy melting steel has receded another 50c. a ton on the basis of a purchase of about 20,000 tons at $14.50 a ton, delivered Bethlehem, Pa. Immediately following a purchase of No. 2 automobile steel at $13.75 a ton, delivered, a Pencoyd, Pa., mill bought a small tonnage at $13.50 a ton. Machine shop turnings have been bought by a Phoenixville, Pa., consumer at $11 a ton, delivered.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel	$14.50 to $15.00
Scrap T rails	14.00 to 14.50
No. 2 heavy melting steel	12.00 to 13.50
No. 1 railroad wrought	15.50 to 16.00
Bundled sheets (for steel works)	11.50
Hydraulic compressed, new	13.50 to 14.00
Hydraulic compressed, old	12.00 to 12.50
Machine shop turnings (for steel works)	11.00
Heavy axle turnings (or equiv.)	13.00 to 14.00
Cast borings (for steel works and roll. mill)	11.00 to 11.50
Heavy breakable cast (for steel works)	14.50
Railroad grate bars	12.00 to 12.50
Stove plate (for steel works)	11.50 to 12.00
No. 1 low phos., hvy., 0.04% and under	21.00 to 22.00
Couplers and knuckles	19.00 to 19.50
Rolled steel wheels	19.00 to 19.50
No. 1 blast f'nace scrap	10.50 to 11.00
Wrot. iron and soft steel pipes and tubes (new specific.)	14.00
Shafting	19.00

Cast iron carwheels	15.50 to 16.00
No. 1 cast	15.50 to 16.00
Cast borings (for chem. plant)	14.50
Steel rails for rolling	16.50 to 17.00

Detroit Scrap Market Weak and Dull

DETROIT, Nov. 26.—On account of the low rate at which automobile companies are operating, very little scrap is being produced in this district. Price declines of 25c. a ton have occurred during the week on several grades.

Dealers' buying prices per gross ton, f.o.b. cars, Detroit:

Hvy. melting and shov. steel	$12.00 to $13.00
Borings and short turnings	8.00 to 8.50
Long turnings	7.50 to 8.00
No. 1 machinery cast	12.50 to 13.00
Automotive cast	11.50 to 12.00
Hydraul. comp. sheets	11.75 to 12.25
Stove plate	9.00 to 9.50
New No. 1 busheling	11.00 to 11.50
Old No. 1 busheling	9.50 to 10.00
Sheet clippings	8.00 to 8.50
Flashings	10.25 to 10.75

To confer on the Hoover constructive program for industry a luncheon meeting will be held at the Manufacturers Club, Philadelphia, Nov. 29.

Building Construction, Cement and Trackwork Shipments

		October, 1929	September, 1929	October, 1928
Building contracts, 37 States(a)		$445,642	$445,402	$595,000(b)

Pacific Coast

Business Only Moderately Affected by Stock Market Decline —Reinforcing Bar Orders Fairly Heavy

SAN FRANCISCO, Nov. 23 (*By Air Mail*).—Those in close touch with business conditions on the Pacific Coast are of the opinion that the recent stock market collapse has affected the purchasing power to some extent, but not to any alarming degree. So far as can be ascertained, unemployment is not increasing in any lines except those affected by seasonal fluctuations. Inventories are not excessive and commercial failures have not increased.

Demand this week was not particularly heavy, though a fairly good tonnage of reinforcing steel bars was booked. This commodity was the most active one. Structural steel and cast iron pipe awards were considerably below the weekly average for the year.

Pig Iron.—Movement of foundry pig iron continues to be confined to unimportant lots for prompt shipment. Prices are unchanged.

Prices per gross ton at San Francisco:

*Utah basic	$25.00 to $26.00
*Utah fdy., sil. 2.75 to 3.25	25.00 to 26.00
**Indian fdy., sil. 2.75 to 3.25	25.00 to 26.00

*Delivered San Francisco.
**Duty paid, f.o.b. cars San Francisco.

Bars.—While demand for merchant bar steel remains light, with prices fairly firm at 2.35c., c.i.f. coast ports, a sizable amount of reinforcing steel bars was placed. The Pacific Coast Steel Co. took 750 tons for a chapel and 325 tons for a warehouse in San Francisco, 150 tons for a garage in Oakland and 110 tons for a dry kiln at Scotia, Cal. The Soule Steel Co. took 500 tons for a sewer project in San Francisco and the Concrete Engineering Co. secured 125 tons for the city of Los Angeles. While 2.30c., base, on carload lots and 2.60c. on smaller tonnages continue as the prevailing quotations in the bay district, Los Angeles prices are $2 a ton higher. Pending business calls for more than 3000 tons.

Plates.—Movement of plates fell off this week. The Steel Tank & Pipe Co. secured the only important letting, 100 tons for a 24-in. welded steel pipe line for the East Bay Municipal Utility District, Oakland. No action has yet been taken on 370 tons for the Cedar River pipe line No. 2 at Seattle. The trade is interested in the proposed consolidation of a number of plate fabricating plants up and down the coast. Definite information has not yet been released, but it is understood that the new company will be capitalized at $8,000,000 and will include a number of plants now competing with the Western Pipe & Steel Co.

Shapes.—Structural bookings did not exceed 500 tons and were the lightest in over 13 weeks. The McClintic-Marshall Co. secured 175 tons for a factory at Maywood, Cal., for the American Brake Shoe & Foundry Co., and the Modern Iron Works took 140 tons for a store building at Santa Ana, Cal. Bids were opened this week on 370 tons for the Dumas Bay bridge at Seattle. Plain material remains firm at 2.35c., c.i.f.

Cast Iron Pipe.—Activity in the cast iron pipe market remains quiet and few new inquiries have come up lately for figures. Lee R. Weber, South Gate, Cal., took 118 tons of 4 to 10-in. Class B pipe for Olive Street, Compton, Cal. The only new inquiry of importance during the week is for 138 tons of 6-in. Class C pipe for Fortieth Street, San Diego, Cal.

Steel Pipe.—So far as can be ascertained, the Standard Oil Co., San Francisco, has not yet taken action on its inquiry for 100,000 tons of gas line pipe. Oil country goods are not in heavy demand, and no large pipe line inquiries, aside from the above, have recently come into the market.

Railroad Material.—It is understood that 14,000 tons of tie plates ordered by the Southern Pacific Co. were divided between the Columbia Steel Corporation and the Colorado Fuel & Iron Co. This railroad has not yet taken any action on its inquiry for 120,000 tons of 90 to 130-lb. T rail, due, no doubt, to the fact that officials of the company are engrossed in Interstate Commerce Commission hearings, being held in San Francisco, on the Great Northern-Western Pacific railroad project.

Warehouse Prices, f.o.b. San Francisco

	Base per Lb.
Plates and struc. shapes	3.30c.
Soft steel bars	3.30c.
Small angles, ⅞-in. and over	3.15c.
Small angles, under ⅞-in.	3.55c.
Small channels and tees, ¾-in. to 2¾-in.	3.75c.
Spring steel, ¼-in. and thicker	5.00c.
Black sheets (No. 24)	4.90c.
Blue ann'l'd sheets (No. 10)	3.80c.
Galv. sheets (No. 24)	5.30c.
Struct. rivets, ½-in. and larger	5.65c.
Com. wire nails, base per keg	$3.40
Cement c't'd nails, 100 lb. keg	3.40

St. Louis

Basic Pig Iron Users Buy for Early Delivery—Foundry Demand Quiet—Steel Sales Decline Slightly

ST. LOUIS, Nov. 26.—A rather large tonnage of basic pig iron is reported to have been purchased during the last week for shipment during the remainder of 1929, consumers having been prompted to buy because of the receipt of railroad car orders. It also is reported that several of the mills in the district are planning to use a greater percentage of basic iron to scrap iron than formerly. Buying of foundry iron is light, being confined almost entirely to carloads for immediate shipment. The stove foundries in the district are said to have slowed down operations, following reports of poor sales due to unseasonable weather. Malleable plants catering to the automobile trade report light business, but agricultural implement manufacturers are operating at full capacity.

Prices per gross ton at St. Louis:

No. 2 fdy., sil. 1.75 to 2.25, f.o.b. Granite City, Ill.	$19.50 to $20.00
Malleable, f.o.b. Granite City	20.00
N'th'n No. 2 fdy., deliv'd St. Louis	22.16
Southern No. 2 fdy., deliv'd	18.42 to 18.92
Northern malleable, deliv'd	22.16
Northern basic, deliv'd	22.16

Freight rates: 75c. (average) Granite City to St. Louis; $2.16 from Chicago; $4.42 from Birmingham.

Coke.—Buying of domestic coke is on a larger scale, following a cold snap the latter part of last week. Foundry coke sales are smaller, but smelters are buying furnace coke of all sizes in liberal quantities.

Rails.—The Missouri-Kansas-Texas will buy 8000 tons of 90-lb. rails within the next few weeks.

Finished Iron and Steel.—The Granite City Steel Co. has reaffirmed its fourth quarter prices on tin plate for first quarter, but has not opened its books for first quarter business in sheets or plates. This company reports a slight falling off in business. Beginning this week, the sheet-mill operation will be cut from 100 per cent to 90 per cent, but the other units will continue at full capacity. Very little construction work is going on, and few projects of size are in hands of architects.

Old Material.—The market for old material continues quiet and weak, with prices unchanged. One of the larger consumers purchased a round tonnage of specialties, but others either are buying nothing or are

Warehouse Prices, f.o.b. St. Louis

	Base per Lb.
Plates and struc. shapes	3.25c.
Bars, soft steel or iron	3.15c.
Cold-fin. rounds, shaftings, screw stock	3.75c.
Black sheets (No. 24)	4.25c.
Galv. sheets (No. 24)	5.10c.
Blue ann'l'd sheets (No. 10)	3.45c.
Black corrug. sheets (No. 24)	4.30c.
Galv. corrug. sheets	5.15c.
Structural rivets	4.15c.
Boiler rivets	4.15c.

	Per Cent Off List
Tank rivets, ⅞-in. and smaller, 100 lb. or more	65
Less than 100 lb.	60
Machine bolts	60
Carriage bolts	60
Lag screws	60
Hot-pressed nuts, sq., blank or tapped, 200 lb. or more	60
Less than 200 lb.	50
Hot-pressed nuts, hex., blank or tapped, 200 lb. or more	60
Less than 200 lb.	50

withholding shipments of material already contracted for. Mills in the district are getting large orders for railroad equipment, but this is not being reflected in purchase of old material. Railroad lists: Atchison, Topeka & Santa Fe, 6660 tons; Union Pacific, 2000 tons; Wabash, 197 tons; Nickel Plate, 54 carloads; St. Louis-San Francisco, 39 carloads; Nashville, Chattanooga & St. Louis, 12 carloads.

Dealers' buying prices per gross ton, f.o.b. St. Louis district:

No. 1 heavy melting or shoveling steel	$13.00 to $13.50
No. 2 heavy melting or shoveling steel	12.00 to 12.50
No. 1 locomotive tires	14.50 to 15.00
Misc. stand.-sec. rails including frogs, switches and guards, cut apart	14.00 to 14.50
Railroad springs	15.50 to 16.00
Bundled sheets	9.50 to 10.00
No. 2 railroad wrought	13.00 to 13.50
No. 1 busheling	9.75 to 10.25
Cast iron borings and shoveling turnings	9.25 to 9.75
Iron rails	13.00 to 13.50
Rails for rolling	15.00 to 15.50
Machine shop turnings	7.25 to 7.75
Heavy turnings	9.50 to 10.00
Steel car axles	18.00 to 18.50
Iron car axles	27.00 to 27.50
Wrot. iron bars and trans.	21.50 to 22.00
No. 1 railroad wrought	13.00 to 13.50
Steel rails, less than 3 ft.	17.00 to 17.50
Steel angle bars	14.00 to 14.50
Cast iron carwheels	14.00 to 14.50
No. 1 machinery cast	15.25 to 15.75
Railroad malleable	13.50 to 14.00
No. 1 railroad cast	14.50 to 15.00
Stove plate	11.75 to 12.25
Agricult. malleable	14.00 to 14.50
Relay. rails 60 lb. and under	20.50 to 23.50
Relay. rails 70 lb. and over	26.50 to 29.00

Apollo Steel Co. Adding 33 Per Cent to Capacity

The Apollo Steel Co., Apollo, Pa., is carrying out an extensive improvement program, costing $750,000, which will increase its capacity by about 33 per cent. The program provides for the installation of mills for producing full finished sheets for the furniture and automobile trades, this being a new line for the Apollo company. With the additions, the company will have a capacity of 15,000 tons a month of steel sheets. The work is already under way, and, it is expected, will be completed within 60 days.

The equipment being installed includes 11 new box annealing furnaces, four pair heating furnaces, three sheet pack furnaces and one normalizing furnace, as well as new cold-rolling equipment, consisting of six stands of rolls. In discussing these improvements, A. M. Oppenheimer, president of the company, stated that he did not believe the letdown in buying by automobile companies would be of long duration.

Warehouse Prices, f.o.b. Buffalo

	Base per Lb.
Plates and struc. shapes	3.40c.
Soft steel bars	3.30c.
Reinforcing bars	2.95c.
Cold-fin. flats, sq. and hex.	4.45c.
Rounds	3.95c.
Cold-rolled strip steel	5.85c.
Black sheets (No. 24)	4.20c.
Galv. sheets (No. 24)	4.85c.

Black wire, base per 100 lb.	3.75

Buffalo

Pig Iron Shipments Heavy But New Buying Is Meager—Steel Mill Operations Decline Further

BUFFALO, Nov. 26.—A heavy volume of specifications against old orders is the feature of this week's pig iron market. Practically all of the melters are accepting iron on schedule or ahead of schedule. Stocks in foundries are apparently low and, with the present status of operations, furnace stocks are likewise low. The price for the district is firm at $19.50. All of the business being placed now is for carload lots for prompt shipment. The Lackawanna plant of the Bethlehem Steel Co. has reduced its operation to five out of seven blast furnaces.

Prices per gross ton, f.o.b. furnace:

No. 2 fdy., sil. 1.75 to 2.25	$19.50
No. 2X fdy., sil. 2.25 to 2.75	20.00
No. 1 fdy., sil. 2.75 to 3.25	21.00
Malleable, sil. up to 2.25	20.00
Basic	$17.50 to 18.00
Lake Superior charcoal	27.28

Finished Steel.—Mill operation has declined. The Lackawanna plant of the Bethlehem Steel Co. is operating at about 60 per cent. Sixteen of its 24 open-hearths are on and most of the mills are on single turn, with some of them down. The Donner Steel Co. is operating three open-hearths, and the Seneca Iron & Steel Co. is operating at about 60 per cent. The Gould Coupler Co. is operating all three of its open-hearths and its acid furnace, and the Wickwire-Spencer Co. is operating three of four open-hearths. The city of Buffalo will place 185 tons of reinforcing bars for school No. 44.

Old Material.—The outstanding transaction in the local market was the sale of approximately 10,000 tons of No. 1 and No. 2 heavy melting steel. The mill paid $14.50 for the No. 1 and $13 for the No. 2. Dealers anticipate little difficulty in filling this order at a reasonable profit. One of the local mills is still holding up shipments, although this week it may release six cars. Consumers are specifying freely against old orders for No. 1 machinery cast scrap, but the price is weaker. Some scrap rails have been purchased at around $14, the differential at this mill being 50c. under No. 1 heavy melting steel. Some sales of steel rails, 2 ft. and under, are reported at $18. The entire list is somewhat softer.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel.	$14.50
No. 2 heavy melting steel.	13.00
Scrap rails	15.00 to 15.50
Hydraul. comp. sheets	13.00
Hand bundled sheets	11.00 to 11.50
Drop forge flashings	13.00
No. 1 busheling	13.00
Hvy. steel axle turnings	13.00
Machine shop turnings	7.50 to 8.00
No. 1 railroad wrought	11.50 to 12.00
Acid Open-Hearth Grades:	
Knuckles and couplers	17.00 to 17.50
Coil and leaf springs	17.00 to 17.50
Rolled steel wheels	17.00 to 17.50
Low phos. billet and bloom ends	18.00 to 18.50
Electric Furnace Grades:	
Short shov. steel turnings	10.75 to 11.25
Blast Furnace Grades:	
Short mixed borings and turnings	10.75 to 11.25
Cast iron borings	10.75 to 11.25
No. 2 busheling	8.00
Rolling Mill Grades:	
Steel car axles	17.00 to 17.50
Iron axles	20.00 to 21.00
Cupola Grades:	
No. 1 machinery cast	14.50 to 15.00
Stove plate	12.00 to 12.25
Locomotive grate bars	11.00 to 11.50
Steel rails, 3 ft. and under	17.75 to 18.00
Cast iron carwheels	12.00 to 12.25
Malleable Grades:	
Industrial	16.50 to 17.00
Railroad	16.50 to 17.00
Agricultural	16.50 to 17.00
Special Grades:	
Chemical borings	12.50 to 13.50

Youngstown

Signs of Slight Gain in Steel Orders—No Substantial Automobile Tonnage is Expected This Year

YOUNGSTOWN, Nov. 26.—Despite the fact that the steel business in the Valleys is extremely dull, signs of slight improvement are reported from some quarters. The automobile industry is the only large steel consumer whose requirements have been sharply reduced, although business from other lines is not so heavy as it was a month ago. Large users of steel in the immediate Youngstown area are operating their plants at a good rate, and their orders are sufficient to continue this rate for some time without much reduction. These companies have not had any of their orders cancelled, and temporary holdups, which were prompted by the recent break in stock prices, have now generally been withdrawn.

Valley steel companies are naturally interested in the trend of automobile production, but nearly all have come to the conclusion that no substantial steel tonnage will move in that direction this year. They expect a gradual resumption of shipments to the Michigan companies in the first quarter. Lack of automotive demand has affected bars, sheets and strips, but demand for these products from other industries is still fairly good. The metal furniture industry is taking full finished sheets at a good rate, and strip steel is moving well to the hardware manufacturers. Demand for sheets and strip from companies manufacturing building materials has declined seasonally, but is considered normal. The pipe business is also as good as could be expected for this time of the year,

and mills in the district are able to maintain a 50 to 60 per cent operating rate in these departments.

Steel ingot production in the Valleys last week reached a very low point. The Republic Iron & Steel Co. operated no open-hearth furnaces at either Youngstown or Warren, Ohio, although the closing down at Warren was prompted partly by mechanical difficulties. The Sharon Steel Hoop Co. had no open-hearths in operation until the middle of the week, while the Youngstown Sheet & Tube ,Co. operated about half of its furnaces. The latter company's Brier Hill plant may be practically inactive this week, while Republic expects to operate several furnaces. Sheet production is at about 40 per cent of capacity, and strip output is somewhat lower. Tin mills have been averaging from 50 to 60 per cent, but improvement is definitely in sight.

Prices are weak and untested. Companies opened their books for the first quarter on strips, nails and wire at unchanged prices, but consumers are uninterested in their requirements for that period. Although sheet order books have not been officially opened, the larger producers would be willing to book tonnage for shipment during the first three months of the year at the present quoted prices of 2.75c., Pittsburgh, for black sheets; 3.50c. for galvanized, and 2.35c. and 2.20c. for blue annealed sheets and light plates. Black sheets are still holding fairly well at the above figure, but the current market on the other grades is about $2 a ton less than these figures. Automobile body sheets are still quotable at 4c. but this price is subject to considerable pressure as is the 4.10c., Pittsburgh, price on metal furniture sheets. In fact, concessions on the latter grade are becoming common.

Prices on primary materials are also subject to question. Although pig iron is still quoted at $18.50, Valley, for basic and foundry iron, and $19 for malleable and Bessemer, sales are negligible and consumers feel that these prices are out of line with current market conditions. The same is true with semi-finished steel on which the $35, Pittsburgh or Youngstown, quotation which has been maintained on spot business for several months has not recently been tested. Expected buying for first quarter will undoubtedly clarify the price situation on these products. The scrap market is also weak, with heavy melting steel quotable somewhere between $15 and $16.

General Refractories Co., Philadelphia, has appointed Paxson Taggart Co., Luzerne and D Streets, Philadelphia, as exclusive high-temperature cement dealer representative in the Philadelphia district. The territory includes the southern half of New Jersey, going as far north as Trenton and Princeton. The products to be handled are Grefco chrome high-temperature cement and Standard silica bonding cement.

Birmingham

Railroad Orders Boost Business in Steel—Pig Iron Shipments Decline—Scrap Dull

BIRMINGHAM, Nov. 26.—The recent announcement by Southern furnaces that they will take first quarter contracts at $14 in competitive territories has resulted in very little tonnage. District buying continues light, mostly in carload lots taken at $14.50. A few inquiries are coming in, but buyers are in no hurry to close for other than nearby requirements. The decline in shipments that began two weeks ago continued through last week. The movement is considerably less now than it was at the beginning of the month. Both district and outside shipments have been affected. The number of active furnaces remains at 16. Of these, nine are on foundry iron, six on basic and one on recarburizing iron.

Prices per gross ton, f.o.b. Birmingham dist. furnaces:

No. 2 fdy., 1.75 to 2.25 sil.	$14.50
No. 1 fdy., 2.25 to 2.75 sil.	15.00
Basic	14.50

Finished Steel.—New rail and car orders boosted last week's bookings of finished steel well above the average for the month. The Illinois Central Railroad placed an order for 25,000 tons of rails with the Tennessee company. The Frisco System placed a contract with the Bessemer plant of the Pullman Car & Mfg. Corporation for 1000 box cars and 700 coal cars. New business in bars, plates and railroad accessories was about equal to the best weeks of the season. Orders for wire products and sheets have declined. Mills are taking first quarter business at unchanged prices. Fabricated structural steel orders included 300 coal car underframes for the Frisco System, booked by the Virginia Bridge & Iron Co. and 160 tons for the Gulf Refining Co., Norfolk, Va., booked by the Ingalls Iron Works Co. Reinforcing bar business is confined to a few small orders. The number of active open-hearths in the district remains at 20.

Cast Iron Pipe.—A general increase in inquiries leads pressure pipe makers to believe that within the next two or three weeks municipalities and utilities will begin to place some of their requirements for next year. The only new project to develop last week was a fair-sized tonnage for Los Angeles, Cal., on which bids are to be opened this week. Bids were rejected on the 4000-ton project at Dallas, Tex., and new bids are to be taken. There has been only a slight reduction in shipments this month, and the current movement is considered fair for the season. Prices continue at $37 to $38 a net ton, Birmingham, for 6-in. and larger sizes.

Coke.—A few foundry coke consumers have contracted for their first quarter requirements at the unchanged price of $5 a net ton, Birmingham. Shipping instructions are a little below the average of the past few weeks. There have been no changes in operations in several weeks. Out of the 1380 ovens, only eight are idle.

Old Material.—Consumers of steel scrap are specifying fully on contracts, and the movement as a whole is considered fairly good. Dealers are keeping stocks light. No improvement in the dull market for iron material is expected before the turn of the year as the period for reducing inventories is now at hand. Prices are unchanged.

Prices per gross ton, deliv'd Birmingham dist. consumers' yards:

Heavy melting steel	$13.00 to $13.50
Scrap steel rails	14.00
Short shoveling turnings	9.00
Cast iron borings	9.00
Stove plate	11.50 to 12.00
Steel axles	22.00
Iron axles	23.00
No. 1 railroad wrought	10.00 to 10.50
Rails for rolling	15.50
No. 1 cast	13.00
Tramcar wheels	12.50
Cast iron carwheels	13.00 to 13.50
Cast iron borings, chem.	13.50 to 14.00

Boston

Southern Pig Iron Prices Firmer While Northern Are Somewhat Easier—Scrap Market in Stalemate

BOSTON, Nov. 26.—Alabama iron prices are firmer, cuts from the $14.50 base not now exceeding 25c. a ton, as against 50c. and more heretofore. In contrast, Buffalo iron is openly quoted at $17 a ton, base furnace, and large users say they have been offered No. 2X at $17 for first quarter delivery. One Buffalo stack, however, is endeavoring to maintain an $18 base. Furnaces east of Buffalo are meeting Buffalo prices, and in some instances have sold at the equivalent of less than $17, base Buffalo. The Walworth Mfg. Co., Boston, bought several hundred tons of iron at the equivalent of less than $17 a ton, base Buffalo, the past week. Local sales of all irons the past week fell considerably short of 5000 tons. No inquiries of importance are in the market, but several large buyers are sounding out the market for first quarter delivery. The last barge load

of Buffalo iron for New England delivery by water and rail this season left Buffalo last week.

Foundry iron prices per gross ton deliv'd to most New England points:

*Buffalo, sil. 1.75 to 2.25	$21.91 to $22.91
*Buffalo, sil. 2.25 to 2.75	21.91 to 23.41
East. Penn., sil. 1.75 to 2.25	22.65 to 23.15
East. Penn., sil. 2.25 to 2.75	23.15 to 23.65
Va., sil. 1.75 to 2.25	25.21
Va., sil. 2.25 to 2.75	25.71
*Ala., sil. 1.75 to 2.25	24.11
*Ala., sil. 2.25 to 2.75	24.61
†Ala., sil. 1.75 to 2.25	20.25
†Ala., sil. 2.25 to 2.75	20.75

Freight rates: $4.91 all rail from Buffalo; $3.65 all rail from eastern Pennsylvania; $5.21 all rail from Virginia; $9.61 all rail from Alabama and $5.75 rail and water from Alabama to New England seaboard.

*All rail rate.

†Rail and water rate.

Fabricated Steel. — The fabricated steel outlook is more encouraging. Several large fabricating jobs give promise of being closed before the end of 1929. Details are withheld. In addition, there are a number of 100 to 400-ton jobs up for figuring. A local postoffice, calling for several thousand tons, will come up for figuring and a $2,000,000 State office building at Hartford, Conn., and a sizable number of bridges also will be let shortly after Jan. 1 if present plans mature. Mills openly quote 1.90c. a lb., base, Pittsburgh, for standard shapes, but 1.85c. has been done.

Reinforcing Steel.—Current buying of billet steel bars is in small lots and competition even for such orders is keen. As a result, prices on all tonnages coming into the market are more or less elastic. The trade openly quotes large tonnages at 2.61½c. a lb., base, from stock; and small lots at 3.16c. The steel bar market continues quiet. While 2.26½c. a lb., base, delivered common Boston freight rate points, is openly quoted, that price has been shaded.

Old Material. — The old material situation is unchanged. Owners of scrap are reluctant to sell at ruling prices, yard stocks are small, steel mills show little interest in supplies, the movement of scrap out of New England is in scattered car lots, while prices remain unsettled, with further concessions on girder rail, steel turnings, steel mill borings and long bundled skeleton. Last week steel turnings were sold for less than $6 a ton, on cars shipping point, for the first time in months. For certain kinds of material, notably rails for rerolling, axles, shafting and railroad and yard wrought, it is difficult to establish prices owing to a lack of buyers and sellers. Scrap exporters also experience difficulty in securing material, but expect to ship several thousand tons to Danzig in December.

Buying prices per gross ton, f.o.b. Boston rate shipping points:

No. 1 heavy melting steel	$9.75 to $10.00
Scrap T rails	9.50 to 10.00
Scrap girder rails	8.50 to 9.00
No. 1 railroad wrought	10.00 to 10.50
No. 1 yard wrought	9.50 to 10.00
Machine shop turnings	5.75 to 6.00
Cast iron borings (steel works and rolling mill)	6.00 to 6.25
Bundled skeleton, long	8.50 to 9.00
Forge flashings	8.50 to 9.00
Blast furnace borings and turnings	5.50 to 6.00
Forge scrap	8.50 to 9.00
Shafting	14.00 to 14.25
Steel car axles	16.00 to 16.50
Wrought pipe 1 in. in diameter (over 2 ft. long)	9.00 to 9.50
Rails for rolling	11.00 to 11.50
Cast iron borings, chemical	9.00 to 9.50

Prices per gross ton deliv'd consumers' yards:

Textile cast	$14.00 to $14.50
No. 1 machinery cast	15.00 to 15.25
No. 2 machinery cast	13.00 to 13.25
Stove plate	11.00 to 11.50
Railroad malleable	18.50 to 19.00

Warehouse Prices, f.o.b. Boston

	Base per Lb.

Cold-punched nuts	50 and 5
Stove bolts	70 and 10

*Including quantity differentials.

Canada

Gain in Spot Demand for Pig Iron

TORONTO, ONT., Nov. 26.—Although no forward buying has developed recently in the Canadian pig iron markets, the demand for spot delivery is showing some improvement. The gain is due to the fact that several melters have practically run out of supplies. Pig iron prices are holding firm.

Prices per gross ton:

Delivered Toronto	
No. 1 fdy., sil. 2.25 to 2.75	$23.60
No. 2 fdy., sil. 1.75 to 2.25	23.10
Malleable	23.60
Delivered Montreal	
No. 1 fdy., sil. 2.25 to 2.75	$25.00
No. 2 fdy., sil. 1.75 to 2.25	24.50
Malleable	25.00
Basic	23.50
Imported Iron, Montreal Warehouse	
Summerlee	$33.50
Carron	33.00

Structural Steel.—Sales in the past week or 10 days have been at a low level. Deliveries against contract, however, are large, and most fabricating plants are still running at capacity. Some improvement in demand is expected to develop in the not distant future as a result of recently announced building programs. Much of the steel required, however, will be for delivery next spring. Among the large orders pending is one for several thousands of tons of structural for a highway and railroad bridge at Vancouver.

Old Material.—Foundries and other consumers of iron grades were more prominent in the market during the week. The demand is chiefly for machinery cast, with stove plate and malleable scrap showing some betterment. Prices are unchanged.

Dealers' buying prices:

	Toronto	Montreal
	Per Gross Ton	
Heavy melting steel	$10.00	$8.50
Rails, scrap	11.00	9.00
No. 1 wrought	10.00	12.00

Stove plate	12.00	....
Standard carwheels	15.00	....
Malleable scrap	14.00	....

October Sheet Production Gained, Sales Off

Production by independent sheet mills showed some gain in October as compared with September, according to the monthly report of the National Association of Flat Rolled Steel Manufacturers. October production of these mills was 319,660 tons, against 302,490 tons in September. While shipments and sales fell off last month, the decline was rather light. Shipments were 291,135 tons, against 301,330 tons during the previous month, and sales were 258,810 tons, against 274,568 tons in September. In both shipments and sales it was the quietest month since the summer of 1928. Unfilled orders also declined, these on Nov. 1 having been 478,038 tons, or less than at any previous time during the year. The October report and comparisons in net tons follow:

	Oct.	Sept.	Aug.
Total number of mills	712	715	722
Capacity per month	498,300	459,075	492,765
Percentage reporting	67.3	67.4	67.9
Sales	258,810	274,568	282,107
Production	319,660	302,490	366,734
Shipments	291,135	301,330	365,649
Unfilled orders	478,038	522,803	570,613
Unshipped orders	106,216	111,042	108,887
Unsold stocks	63,174	43,886	34,436
	Percentages of Capacity		
Sales	77.2	88.7	84.4
Production	95.3	97.7	109.7
Shipments	86.8	97.4	109.4
Unfilled orders	142.6	168.9	170.7
Unshipped orders	31.7	35.9	32.6
Unsold stocks	18.8	14.2	10.3

Use of By-Product Gases for Welding Encouraged

To stimulate experiments in the use of illuminating or city gas instead of compressed acetylene gas for the welding and cutting process, the Alexander Milburn Co., Baltimore, manufacturer of welding and cutting equipment, is offering a prize of $1,000 during each of the next three years for the best authenticated results accomplished with illuminating or by-product gases tending to lower the costs of present methods. The results are to be embodied in articles to be submitted to the company and passed on by a committee of judges.

Cincinnati

Pig Iron Sales Increase Slightly but Buyers Still Pursue Conservative Policy—Scrap Dull and Weak

CINCINNATI, Nov. 26. — Although total sales of pig iron in this district last week were a trifle larger than in the preceding week, there is no indication that district consumers have abandoned the conservative buying policy which has prevailed for the last few months. In fact, furnace representatives report that buyers are taking substantially less iron than they specify in their inquiries, and even shipping orders against contracts are being curtailed. A Hamilton, Ohio, buyer, who inquired a week ago for 1200 to 1500 tons of Northern foundry iron, closed for only 750 tons, which was the only sizable order of a total of 2700 tons of iron sold last week. Prices, however, are being maintained. A report from Birmingham, last week of the offering of Southern iron at $14, base, Birmingham, for first quarter sales in Middle West cities, while confirmed here, is said not to apply in this district. All Southern furnaces, except one, are maintaining quotations at about $14.50, base Birmingham, while the exception is not granting concessions under $14. The only inquiry before the trade is for 500 tons of Northern foundry from a Kokomo, Ind., consumer.

Prices per gross ton, deliv'd Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25	$19.89 to $20.39
Ala. fdy., sil. 1.75 to 2.25	17.69 to 18.19
Ala. fdy., sil. 2.25 to 2.75	18.19 to 18.69
Tenn. fdy., sil. 1.75 to 2.25	17.69 to 18.19
S'th'n Ohio silvery, 8 per cent	26.89

Freight rates, $1.89 from Ironton and Jackson, Ohio; $3.69 from Birmingham.

Finished Material.—Although fresh bookings of district sheet mills were approximately the same last week as in the preceding week, consumers are displaying a less hesitant attitude. New orders during the week were about 40 to 45 per cent of capacity, while operating schedules were curtailed to about 40 per cent of normal. Hot and cold-rolled strip are well below the normal demand. Despite this slowness of new business in the district, mills are beginning to receive a good many inquiries for first quarter.

Coke. — Shipments of by-product foundry coke are sharply below the level of October, and district oven representatives anticipate a further decline in December. Prices, however, will continue at about $10.05, delivered in Cincinnati, during December.

Old Material. — The old material market is dull and featureless. Dealers are bidding from 25c. to 75c. less on the leading items than they did a week ago and they indicate that further reductions may be necessary during the next week. Although the largest supply of scrap is in the cast grades, dealers say there is a comfortable quantity of steel scrap available. Mills are taking scrap on contract at a fair rate, but practically no new business is being done.

Warehouse Prices, f.o.b. Cincinnati

	Base per Lb.
Plates and struc. shapes	3.40c.

No. 1 machinery cast	18.50 to 19.00
No. 1 railroad cast	15.00 to 15.50
Burnt cast	10.00 to 10.50
Stove plate	10.00 to 10.50
Brake shoes	10.00 to 10.50
Agricultural malleable	14.00 to 14.50
Railroad malleable	15.00 to 15.50

More Coking Coal at By-Product Plants

WASHINGTON, Nov. 22. — During the third quarter stocks of coking coal at by-product coke plants increased nearly 1,000,000 tons, while steel works stocks showed a slight decline, says the Bureau of Mines.

Complete returns from the by-product plants showed 5,417,554 tons of coking coal in storage on Oct. 1, of which 3,832,120 tons was high-volatile and 1,585,434 tons was low-volatile. The by-product plants had an average of 26 days' supply of coal on Oct. 1, against 23 days' on Aug. 1, the supply of low-volatile coal on Oct. 1, being 29 days' against 24 on Aug. 1, and the supply of high-volatile being 24 days' and 22 days', respectively.

Steel plants reported 782,491 tons of steam coal and 570,467 tons of gas coal in stock on Oct. 1, a total of 1,352,958 tons. The average supply of coal at steel plants on Oct. 1, was 27 days', against 26 on Aug. 1. The supply of gas coal on Oct. 1, was 28 days', against 27 on Aug. 1, while the supply of steam coal was 26 days' and 25 days', respectively.

Consumers' stocks of bituminous coal throughout the country on Oct. 1, totaled 37,500,000 tons, an increase of 4,400,000 tons over July 1, but 3,600,000 tons below one year ago.

American Steel & Wire Co. to Expand at Donora, Pa.

The American Steel & Wire Co. will make extensions to its Donora, Pa., works, involving an expenditure of approximately $5,000,000. Construction will include a continuous billet mill and two continuous rod mills. These will handle the product of the present 40-in. blooming mill. With the present layout, the steel is reduced into 4 x 4-in. billets before cooling, but with the new billet mill the stock will be reduced to smaller sizes before reheating. The new mills will have an annual capacity of 225,000 to 250,000 tons.

These extensions had been under consideration for some time and were authorized the past week in the carrying out of the Steel Corporation's program of plant extensions and improvements. While details have not all been worked out, the company plans to start at once on the construction work necessary to carry out its program.

Steel Castings and Barrels and Canadian-Made Automobiles

	October, 1929	September, 1929	October, 1928
Steel barrels produced (a)	629,904 (b)	668,224	656,021

Fabricated Structural Steel

Fresh Inquiries for 65,000 Tons Include 32,000 Tons for Two Chicago Projects

ALTHOUGH structural steel awards were only half of those of the previous week, amounting to 22,000 tons, fresh inquiries continue heavy and give promise of an active winter in the building construction industry. Work which came out for bids the past week totaled 65,000 tons. Approximately half of this tonnage is for two Chicago projects. An addition to the Chicago *Tribune* tower will take 17,000 tons and an addition to the Morrison Hotel 15,000 tons.

That building activities in New York are being maintained at a good rate is shown by the fact that over 50 per cent of the volume of work let in the past week is in that city. The largest awards were 4000 tons for a New York apartment house and 3300 tons for a Pittsburgh telephone building. Awards follow:

BOSTON & MAINE RAILROAD, 700 tons; three bridges, 330 tons, to Phoenix Bridge Co.; five bridges, 170 tons, to Boston Bridge Works, Inc.

WELLESLEY, MASS., 300 tons, administration building, to New England Structural Co.

ANDOVER, MASS., 200 tons, two school units, to New England Structural Co.

CAMBRIDGE, MASS., 187 tons, Boston & Maine power house, to Palmer Steel Co.

SOMERVILLE, MASS., 100 tons, ice making plant, to unnamed fabricator.

NEW YORK, 800 tons, high school in Queens, to Harris Structural Steel Co.

NEW YORK, 1450 tons, apartment building at 431 East Fifty-first Street, to Lehigh Structural Steel Co.

NEW YORK, 2000 tons, apartment building at Park Avenue and Eighty-ninth Street, to Taylor-Fichter Steel Construction Co., Inc.

NEW YORK, 4000 tons, apartment building at Madison Avenue and Seventy-sixth Street, to Paterson Bridge Co.

NEW YORK, 1200 tons, New York Trust Co. building at Fifth Avenue and Fifty-seventh Street, to McClintic-Marshall Co.

BROOKLYN, 1300 tons, *New York Times* building, to Lehigh Structural Steel Co.

LONG ISLAND RAILROAD, 350 tons, bridge, to American Bridge Co.

PHILADELPHIA, 500 tons, Jewelry Trade Building on Sansom Street, to American Bridge Co.

LEHIGH VALLEY RAILROAD, 500 tons, bridges, to Bethlehem Steel Co.

STATE OF MARYLAND, 275 tons, highway bridge, to American Bridge Co.

BALTIMORE, 500 tons, Young Men's Hebrew Association building, to Dietrich Brothers.

BIG SANDY & CUMBERLAND RAILROAD, 1200 tons, bridges, to Virginia Bridge & Iron Co.

NORFOLK, VA., 160 tons, Gulf Refining Co., to Ingalls Iron Works.

PITTSBURGH, 3300 tons, addition to Bell Telephone office building, to McClintic-Marshall Co.

MIDLAND, MICH., 1000 tons, power house addition for Dow Chemical Co., to Flint Structural Steel Co.

INDIANA HARBOR, IND., 200 tons, Youngstown Sheet & Tube Co., to Hansell-Elcock Co., Chicago.

CHICAGO, 325 tons, two buildings for Grigsby-Grunow Co., to McClintic-Marshall Co.

CHICAGO, ROCK ISLAND & PACIFIC, 340 tons, bridges, to American Bridge Co.

MILWAUKEE, 100 tons, for Curtiss Airport, to Lakeside Bridge & Steel Co.

OAKLAND, CAL., 100 tons plates, 24-in. welded steel pipe line for East Bay Municipal Utility District, to Steel Tank & Pipe Co.

SANTA ANA, CAL., 140 tons, store, Sixth and Main Streets, to Modern Iron Works.

MAYWOOD, CAL., 175 tons, factory for American Brake Shoe & Foundry Co., to McClintic-Marshall Co.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

BOSTON & MAINE RAILROAD, 1000 tons, bridge at Windsor, Vt.

SOUTH DARTMOUTH, MASS., 1300 tons, building for an unnamed owner.

NEW HAVEN, CONN., 600 tons, New Haven Hospital.

BROOKLYN, 1000 tons, public library.

NEW YORK, 1500 tons, apartment building at Eighty-eighth Street and Madison Avenue.

NEW YORK, 1200 tons, buildings for Hunter's College.

NEW YORK, 3500 tons, Walton High School in Bronx.

LANCASTER, PA., 500 tons, telephone building.

PHILADELPHIA, 6800 tons, convention hall; all bids rejected.

PHILADELPHIA, 600 tons, Presbyterian Hospital; bids in.

PHILADELPHIA, 400 tons, Olney Avenue bridge.

PHILADELPHIA, 2000 tons, Plaza subway under City Hall; general contract to Underpinning & Foundation Co.

CHICAGO, 300 tons, garage for Western Electric Co.

DETROIT, 600 tons, building for W. E. Wood Co.

CLEVELAND, 720 tons, Kinsman Road bridge for Nickel Plate Railroad.

CLEVELAND, 1000 tons, Severance Hall, Cleveland Orchestra Home.

AKRON, OHIO, tonnage unstated, Mayflower Hotel, plans to be out in January.

AKRON, OHIO, 700 tons, Young Men's Christian Association Building.

AKRON, OHIO, 700 tons, Young Women's Christian Association Building.

CINCINNATI, 1750 tons, building as part of Cincinnati Union Terminals Co. development.

CHESAPEAKE & OHIO RAILROAD, 1500 tons, new bridge at Cincinnati.

COLUMBUS, OHIO, 225 tons, building for Columbus Mutual Auto Insurance Co.

CHICAGO, BURLINGTON & QUINCY, 900 tons, girder spans.

CHICAGO, 17,000 tons, addition to *Tribune* Tower.

CHICAGO, 15,000 tons, addition to Morrison Hotel.

CHICAGO, 600 tons, substation for Commonwealth Edison Co.

GRANITE FALLS, MINN., 2000 tons, power house.

KANSAS CITY, KAN., 600 tons, hotel for Fisher Realty Co.

DENNISON, TEX., 950 tons, highway bridge.

TERRAL, OKLA., 1150 tons, highway bridge.

THACKERVILLE, OKLA., 1150 tons, highway bridge.

RANDOLPH, OKLA., 3000 tons, power house.

OKLAHOMA CITY, OKLA., 3000 tons, power house.

SEATTLE, 370 tons, Dumas Bay bridge; S. A. Moceri, low bidder on general contract.

Ship Program May Take 200,000 Tons of Steel

WASHINGTON, Nov. 26.—Until the Shipping Board makes its report, it is impossible to say accurately the number, size and speed of vessels that will be required for the 13 ocean mail routes which the interdepartmental committee on the merchant marine at a meeting yesterday unanimously voted to authorize the Postoffice Department to advertise. Under the law, the Shipping Board must certify, through the Postmaster-General, the type, size, speed and other characteristics of the vessels which should be employed on each route.

Postmaster General Brown said that the 13 routes will require 40 vessels, with 460,000 gross tonnage, costing $250,000,000, to be spread over 10 years. On this basis, the estimate of 150,000 to 200,000 tons of steel for these ships is considered conservative.

In addition to 13 routes which will be advertised soon, the interdepartmental committee will in the near future authorize advertisement for two additional routes requiring at least four new ships.

Steel Committee Selected for Chicago Fair

A committee of nine will study the most effective means of exhibiting advances in steel production during the past 100 years at the Chicago Century of Progress Celebration in 1933. Headed by W. H. Eisenman, secretary of the American Society for Steel Treating, the committee includes C. B. Murray, who will deal with ores; Arthur G. McKee, blast furnaces; H. M. Boylston, metallurgy as related to steel making; H. A. Schwartz, castings; Zay Jeffries, non-ferrous metals, all of whom are in Cleveland. Others are C. H. Herty, Jr., Pittsburgh, who will deal with the open-hearth; Mark Lathrop, Canton, Ohio, electric steel, and W. B. Coleman, Philadelphia, to whom has been assigned the mechanical aspects of the subject.

Leaders in the mineral industries from all parts of the country will assemble in Washington from Dec. 4 to 7 to take part in the thirty-second annual convention of the American Mining Congress, whose program will embrace a discussion of trends in industry, mineral taxation, the coal industry, mine mechanization, and the relation of government toward business.

Non-Ferrous Metal Markets

Copper More Active, Price Unchanged—Tin Dull, Prices Higher—Lead and Zinc Quiet

NEW YORK, Nov. 26.

Copper.—It is stated by copper producers generally that reports which prevailed yesterday and today in Wall Street that a reduction in the price of copper is pending is purely stock market propaganda. Primary producers and custom smelters assert that the price of electrolytic copper is still 18c., delivered in the Connecticut Valley. In a market such as the present there is always a small quantity of metal which can be obtained at a concession, and this has been the case for several weeks. That the quantity is not large is demonstrated by the fact that one large fabricator is reported to have been able to obtain no more than 200 tons at a lower price. Sales to foreign consumers have been considerably larger in the last few days. This morning about 1000 tons has been sold and on Monday the total was about 1600 tons. On Friday and Saturday the foreign sales were about 1600 and 2000 tons respectively. They all call for prompt shipment. Foreign consumers are bare of stocks and evidently must buy considerable during December, but probably not as much as in the earlier months of the year. The fact that money is easier in Europe is used as an argument that foreign consumers will buy fairly liberally in the near future. Domestic buying is a little better this week, but it is by no means large. Some metal is being sold each day at 18c., with a little here and there from dealers and other sources at around 17.75c. delivered in the Connecticut Valley, as against 17.50c. a week ago. One large producer reports that his advices are that shipments of copper wire and sheets are 70 to 75 per cent of capacity. There is undoubtedly some falling off in demand for brass products. The quotation of Copper Exporters, Inc., is still maintained at 18.30c. c.i.f. usual European ports. Lake copper is quiet but firm at 18 to 18.12½c. delivered.

Tin.—Despite marked activity in the London market, sales on this side have been lighter than in many weeks. The London market has advanced rapidly, with large sales on the London metal exchange practically every day. This is said to be due to a report that some time tomorrow, Nov. 27, there will be a meeting of the so-called "group" at which an important announcement will be made.

THE WEEK'S PRICES. CENTS PER POUND FOR EARLY DELIVERY

	Nov. 26	Nov. 25	Nov. 23	Nov. 22	Nov. 21	Nov. 20
Lake copper, New York	18.12½	18.12½	18.12½	18.12½	18.12½	18.12½

Rolled Products
List Prices, Per Lb., f.o.b. Mill

On Copper and Brass Products, Freight up to 75c. per 100 Lb. Allowed on Shipments of 500 Lb. or Over.

Sheets—
- High brass ..... 23.25c.
- Copper, hot rolled ..... 26.75c.
- Zinc ..... 10.50c.
- Lead (full sheets) ..... 10.25c.

Seamless Tubes—
- High brass ..... 28.25c.
- Copper ..... 29.25c.

Rods—
- High brass ..... 21.25c.
- Naval brass ..... 24.00c.

Wire—
- Copper ..... 19.87½c.
- High brass ..... 23.75c.

Copper in Rolls ..... 26.75c.
Brazed Brass Tubing ..... 30.87½c.

Aluminum Products in Ton Lots

The carload freight rate is allowed to destinations east of Mississippi River and also to St. Louis on shipments to points west of that river.

- Sheets, 0 to 10 gage, 3 to 30 in. wide ..... 33.00c.
- Tubes, base ..... 42.00c.
- Machine rods ..... 34.00c.

Chicago Warehouse

(Prices Cover Trucking to Customers' Doors in City Limits)

Sheets—	Base per Lb.
High brass	23.25c.
Copper, hot rolled	27.75c.
Copper, cold rolled, 14 oz. and heavier	30.00c.
Zinc	10.75c.
Lead, wide	10.30c.
Seamless Tubes—	
Brass	28.25c.
Copper	29.25c.
Brass Rods	21.25c.
Brazed Brass Tubes	31.00c.

New York or Cleveland Warehouse

Delivered Prices, Base per Lb.

High brass	21.12½c.	to 22.12½c.
Copper, hot rolled, base sizes	27.75c.	to 28.75c.
Copper, cold rolled, 14 oz. and heavier, base sizes	30.00c.	to 31.00c.
Seamless Tubes—		
Brass	26.00c.	to 27.00c.
Copper	29.12½c.	to 30.12½c.
Brass Rods	18.87½c.	to 19.87½c.
Brazed Brass Tubes	29.12½c.	to 30.12½c.

New York Warehouse

Delivered Prices, Base Per Lb.

- *Zinc sheets (No. 9), casks* ..... 10.75c. to 11.25c.
- *Zinc sheets, open* ..... 11.50c. to 12.00c.

Metals from New York Warehouse

Delivered Prices, Per Lb.

- Tin, Straits pig ..... 43.00c. to 44.00c.
- Tin, bar ..... 45.00c. to 46.00c.
- Copper, Lake ..... 19.50c.
- Copper, electrolytic ..... 19.25c.
- Copper, casting ..... 19.00c.
- Zinc, slab ..... 7.25c. to 7.75c.
- Lead, American pig ..... 7.00c. to 7.50c.
- Lead, bar ..... 9.00c. to 9.50c.
- Antimony, Asiatic ..... 10.50c. to 11.00c.
- Aluminum No. 1 ingots for remelting (guaranteed over 99% pure) ... 25.00c. to 26.00c.
- Alum. ingots, No. 12 alloy ..... 24.00c. to 25.00c.
- Babbitt metal, commercial grade ..... 25.00c. to 35.00c.
- Solder, ½ and ½ ..... 28.50c. to 29.00c.

Metals from Cleveland Warehouse

Delivered Prices, Per Lb.

- Tin, Straits pig ..... 47.00c.
- Tin, bar ..... 49.00c.
- Copper, Lake ..... 19.50c.
- Copper, electrolytic ..... 19.25c.
- Copper, casting ..... 18.75c.
- Zinc, slab ..... 8.00c. to 8.25c.
- Lead, American pig ..... 7.00c. to 7.20c.
- Lead, bar ..... 9.25c.
- Antimony, Asiatic ..... 16.00c.
- Babbitt metal, medium grade ..... 18.00c.
- Babbitt metal, high grade ..... 50.00c.
- Solder, ½ and ½ ..... 29.50c.

Old Metals, Per Lb., New York

Buying prices represent what large dealers are paying for miscellaneous lots from smaller accumulators and selling prices are those charged consumers after the metal has been properly prepared for their uses.

	Dealers' Buying Prices	Dealers' Selling Prices
Copper, hvy. crucible	14.75c.	16.00c.
Copper, hvy. and wire	14.50c.	15.50c.
Copper, light and bottoms	12.50c.	13.50c.
Brass, heavy	8.00c.	9.00c.
Brass, light	6.75c.	7.75c.
Hvy. machine composition	11.50c.	12.50c.
No. 1 yel. brass turnings	9.25c.	9.75c.
No. 1 red brass or compos. turnings	10.75c.	11.75c.
Lead, heavy	4.75c.	5.25c.
Lead, tea	3.75c.	4.25c.
Zinc	3.25c.	3.75c.
Sheet aluminum	13.00c.	14.00c.
Cast aluminum	11.25c.	13.25c.

This is understood to signify curtailment in tin production and this has caused the London buying. In New York, the situation has been the exact opposite to that in London. There is no interest by consumers, who are apparently pretty well covered and, because of the uncertainty in the business outlook, they are very cautious. Dealers are also inactive. Prices today in London were the highest in some weeks, with spot standard quoted at £188 10s., future standard at £191 5s. and spot Straits at £192 10s., all nearly £9 per ton higher than a week ago. The Singapore price today was £194 7s. 6d. Sympathetically, quotations in New York have advanced nearly every day. Today, in a very dull market, spot Straits tin was quoted at 41.62½c., New York.

Lead.—Sales, which are not in large volume, are principally for prompt and early December shipment. Quotations are unchanged at 6.10c., St. Louis, for delivery into January. The price of the leading interest continues at 6.25c., New York, as the contract quotation.

Zinc.—Unquestionably some consumers are very low in stocks of prime Western zinc, but they are buying only what they absolutely have to. There are rumors of low prices, but sales at these reported levels are hard to substantiate and are small at the best. Most producers are maintaining their asking price at 6.25c., East St. Louis, or 6.60c., New York, and are doing some business at these levels. The ore price was unchanged last week at $40, Joplin, and sales were small at 5680 tons. Production has been reduced, but not to the extent expected. It was 8500 tons last week, and the ore surplus is now estimated at 55,147 tons.

Antimony.—Chinese metal for spot and future delivery is quoted unchanged at 8.62½c. New York, duty paid. Demand is very light.

Nickel.—Wholesale lots of ingot nickel are quoted at 35c. a lb., with shot nickel at 36c. and electrolytic nickel in cathodes at 35c.

Aluminum.—Virgin metal, 98 to 99 per cent pure, is obtainable at the published price of 23.90c. a lb., delivered.

Non-Ferrous Metals at Chicago

CHICAGO, Nov. 26.—On the whole this market is quiet. Quotations for tin have advanced and prices for zinc are a shade lower. The old metal market is moderately active and prices are holding.

Prices per lb., in carload lots: Lake copper, 18.50c.; tin, 42.75c.; lead, 6.20c.; zinc, 6.30c.; in less-than-carload lots, antimony, 9.50c. On old metals we quote copper wire, crucible shapes and copper clips, 14c.; copper bottoms, 11.50c.; red brass, 11.50c.; yellow brass, 8c.; lead pipe, 4.50c.; zinc, 3c.; pewter, No. 1, 24.50c.; tin foil, 24c.; block tin, 34c.; aluminum, 12.87½c.; all being dealers' prices for less-than-carload lots.

Railroad Equipment

St. Louis-San Francisco Places Order for 3800 Cars

THE placing of an order by the St. Louis-San Francisco for 3800 freight cars was the feature of the week in the railroad equipment market. Inquiries which have appeared in the past week for approximately 2700 cars and reports of further prospective buying which is regarded as imminent indicate that the carriers of the country are planning to expend large sums for replacement of old rolling stock. The Reading is taking bids on 1000 to 2000 steel box cars and the Missouri-Kansas-Texas will purchase 600 coal cars. The New York Central will buy 1060 freight cars, 65 locomotives and 10 steel dining cars. The Rock Island has ordered 40 freight locomotives. Details of the week's business follow:

Purchase of 1060 freight cars, 65 locomotives and 10 all-steel dining cars will be made by the New York Central railroad if the Interstate Commerce Commission will give the requested authority to issue $5,895,000 4½ per cent equipment trust certificates. Such requests are almost invariably granted. This is understood to be only a part of the New York Central's 1930 program.

St. Louis-San Francisco has purchased 700 coal cars and 1000 box cars from Pullman Car & Mfg. Corporation, 1500 box cars from American Car & Foundry Co., 300 automobile cars from General American Tank Car Corporation, underframes for 300 coal cars to be built in company's shops at Memphis, Tenn., from Virginia Bridge & Iron Co.

Missouri-Kansas-Texas will purchase 600 coal cars, three steel dining cars, 25 cabooses and 100 miles of automatic block signals. This railroad will also build 500 cars in its own shops.

Chicago, Rock Island & Pacific has ordered 40 freight locomotives of the 4-8-4 type from American Locomotive Co.

Reading Railroad is inquiring for 1000 to 2000 all-steel box cars.

North American Car Co. is inquiring for 50 to 100 express refrigerator cars.

Shell Co., San Francisco, is in the market for 10 flat cars.

Denver & Rio Grande Western is inquiring for 10 Mallet type locomotives.

East Jersey Railroad & Terminal Co. has ordered a switching engine from Baldwin Locomotive Works.

Peoples Gas By-products Corporation, Chicago, is inquiring for 10 to 25 tank cars.

Santa Fe has ordered 100 tank cars from General American Tank Car Corporation.

Lehigh & New England is in the market for three 8-wheel switching locomotives and two decapods.

Reinforcing Steel

Awards, at 6000 tons, Show Large Gain Over Previous Week

LETTINGS, totaling 6000 tons, showed a substantial gain over those of the previous week. The largest award was 1300 tons for culverts for an interurban railway at Cleveland. Eight hundred tons will be required for an Akron, Ohio, department store. New work which came out for bids was the largest since the latter part of October, amounting to 3600 tons, of which 900 tons is for a New York subway section and 700 tons for a Brooklyn public library. Awards follow:

NEW YORK, 100 tons, work for Baltimore & Ohio Railroad on Staten Island, to Faitoute Steel Co.

AKRON, OHIO, 800 tons, Polsky department store, to West Virginia Rail Co.

CLEVELAND, 1300 tons, culverts for Cleveland Interurban Railway Co., to Bourne-Fuller Co.

CLEVELAND, 120 tons, buildings for American Telephone & Telegraph Co., to Republic Structural Iron Works.

CHICAGO, 450 tons, apartment building at Sixty-ninth Street and Crandon Avenue, to Inland Steel Co.

PONTIAC, ILL., 200 tons, State Hospital, to Calumet Steel Co.

MAYWOOD, ILL., 125 tons, high school, to Concrete Engineering Co.

AURORA, ILL., 150 tons, telephone exchange, to Joseph T. Ryerson & Son.

STATE OF ILLINOIS, 200 tons, highway bridge and highway work, to Calumet Steel Co.

WHITTIER, CAL., 100 tons, mausoleum, to unnamed bidder.

LOS ANGELES, 125 tons for city, to Concrete Engineering Co.

PALO ALTO, CAL., 100 tons, apartment building, to Concrete Engineering Co.

SCOTIA, CAL., 110 tons, dry kiln for Pacific Lumber Co., to Pacific Coast Steel Co.

SAN FRANCISCO, 750 tons, Grace Cathedral chapel, to Pacific Coast Steel Co.

SAN FRANCISCO, 325 tons, warehouse for Western Sugar Refining Co., to Pacific Coast Steel Co.

SAN FRANCISCO, 500 tons, sewer, to Soule Steel Co.

OAKLAND, CAL., 210 tons, Pier 14 for Port Commission, to Gunn, Carle & Co.

OAKLAND, 150 tons, garage, Eleventh and Washington Streets, to Pacific Coast Steel Co.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

BOSTON, 200 tons, Edison Electric & Illuminating Co. plant.

NEW YORK, 900 tons, subway section 10, route 110.

BROOKLYN, 700 tons, public library.

BUFFALO, 185 tons, school No. 44.

CINCINNATI, 400 tons, new high school.

FORT WAYNE, IND., tonnage not stated, building for General Electric Co.

STATE OF INDIANA, 200 tons, State road work.

EAST MOLINE, ILL., 100 tons, high school.

SPRINGFIELD, ILL., 175 tons, Centennial building; Great Lakes Construction Co., low bidder on general contract.

TACOMA, WASH., 300 tons, grain elevator for city; bids opened.

SAN FRANCISCO, 310 tons, sewer on Alemany Boulevard; bids opened.

SAN FRANCISCO, 130 tons, dyeing and cleaning plant; bids opened.

The Concrete Reinforcing Steel Institute, Chicago, has opened a New York office at 11 West Forty-second Street. J. P. Thompson is in charge.

PERSONAL

W. A. FORBES, assistant to the president of the United States Steel Corporation, who has been abroad since early in September, is expected to arrive, on his return to the United States, on Dec. 15.

—

E. C. WOOD and E. E. LITZ sailed Nov. 27 for Russia to join the group of Freyn engineers who have been in Leningrad since last May, in connection with a contract between the Freyn Engineering Co. and the Union of Socialist Soviet Republics for technical assistance in the Russian iron and steel indusry.

—

GEORGE C. DAVIS has been appointed eastern distributer, with offices at 292 Madison Avenue, New York, for the Case Hardening Service Co., Cleveland.

—

W. J. DIEDERICHS, formerly metallurgist in the bearing division of the Timken Roller Bearing Co., Canton, Ohio, has become metallurgist for the Autocar Co., motor truck manufacturer, Ardmore, Pa.

—

MAX MELTZER, formerly of the Hausman & Wimmer Co., Pittsburgh, and for a number of years with the Continental Iron & Steel Co., New York, iron and steel scrap broker, has become identified with the Detroit office of the Joseph Schonthal Co., iron and steel scrap, Columbus, Ohio.

—

LEROY O. PFAU has withdrawn as copartner in the business operated under the name of Acme Tool & Machine Co., tool and die maker, Milwaukee, which will be continued under the same name by the remaining two copartners, HAROLD LARSON and KURT KERSEG.

—

C. N. MAURER, recently State traffic engineer with the Wisconsin Highway Commission, has been made sales promotion engineer for the Heil Co., Milwaukee, manufacturer of steel pressure and storage tanks, motor truck bodies, hydraulic hoists and snow plows.

—

ROGER NEWBERRY, heretofore manager of the foreign department of the Bucyrus-Erie Co., South Milwaukee, Wis., has left for England, to become director of sales of the Ruston-Bucyrus, Ltd., an associated company. N. R. KNOX has been made assistant to the vice-president in charge of manufacturing and C. K. CHARLTON has been named superintendent of foundries, both at South Milwaukee. P. NORDSTROM has been appointed engineer in charge of plant improvements at South Milwaukee and Evansville.

—

S. C. VESSY, president, W. W. Sly Mfg. Co., Cleveland, has been elected to the board of directors of the American Foundrymen's Association and D. M. AVEY, editor, *Foundry*, Cleveland, has been appointed chairman of the association's committee on international relations. Mr. Vessy and Mr. Avey succeed the late H. COLE ESTEP, vice-president, Penton Publishing Co., Cleveland, who held both positions.

—

W. M. CORSE, metallurgical engineer, Washington, addressed the Detroit chapter of the American Society for Steel Treating, Nov. 18, on bearings and bearing metals. E. M. STAPLES, research associate at the Bureau of Standards for the Bunting Brass & Bronze Co., Toledo, assisted Mr. Corse.

—

W. H. EISENMAN, secretary, American Society for Steel Treating, has been elected for the third successive year to head the Association of Exposition Managers. He has been director of the National Metal Exposition since 1919.

—

EMMETT B. CARTER, industrial engineer, New York, is now located at Bradford, Pa., with the S. R. Dresser Mfg. Co., maker of pipe fittings. He is in charge of the extensions and improvements that this company will make to the Bradford plant.

—

RALPH H. TYLER, who has been identified with the drop forging industry for the past 23 years, has become associated with the hammer department of the Industrial Brownhoist Corporation, Cleveland, to advise with manufacturers engaged in drop forging work.

—

JEROME STRAUSS, chief research engineer of the Vanadium Corporation of America, Bridgeville, Pa., will address the members of the Boston chapter of the American Society for Steel Treating on Dec. 6. The history of vanadium and its relation to the chemical and metallurgical industries will be discussed.

—

F. P. MULLINS has resigned as vice-president and secretary-treasurer of the Mullins Mfg. Co., Salem, Ohio. R. F. WHITE has been elected a director to succeed Mr. Mullins and W. P. CARPENTER and CLIFTON REEVES have been elected treasurer and secretary respectively.

—

R. S. POISTER has been elected vice-president in charge of operations of the Alan Wood Steel Co., Conshohocken, Pa. He has also been elected vice-president in charge of operations of the Alan Wood Mining Co., a corporation just organized to operate the Oxford and Replogle iron mine properties in New Jersey recently leased from the Warren Foundry & Pipe Co. R. W. HEFFNER has been elected vice-president in charge of operations of the Rainey-Wood Coke Co., an affiliated organization.

Lamson & Sessions Co. Elects New Officers

New officers of the Lamson & Sessions Co., Cleveland, were elected Nov. 25, completing the merger of that company and the Lake Erie Bolt & Nut Co. Stockholders of the two companies at meetings late in the week approved the consolidation, which will become effective Dec. 1.

Four new directors who were on the board of the Lake Erie company were added to the Lamson & Sessions Co. directorate. These are N. J. Clarke,

GEORGE S. CASE

who has been president of the Lake Erie company; S. Livingston Mather and Richard Inglis, Cleveland, and Hugh McNicol, East Liverpool. C. L. Wasmer, who was on the Lamson & Sessions board of directors, tendered his resignation. J. G. Jennings, who has been president of the Lamson & Sessions Co., became chairman of the board, succeeding Frank C. Case, who retired.

George S. Case was elected president; N. J. Clarke, vice-president and chairman of the executive committee; I. L. Jennings, vice-president and director of sales; Roy H. Smith, vice-president and director of factories; C. H. Longfield, secretary and manager of sales; H. E. Volmar, treasurer; H. P. Ladds, assistant manager of sales, and H. H. Winterberg, assistant secretary and treasurer. Mr. Volmar was treasurer of the Lake Erie company and Mr. Ladds was sales manager of that company.

The Detroit Alloy Steel Co. has appointed William C. Eakin eastern district sales manager, with offices at 707 Berkshire Avenue, Pittsburgh, for the distribution of PRK-33 Cobaltcrom air-hardening tool steel castings made under rights secured from Darwin & Milner, Inc.

OBITUARY

SAMUEL B. SHELDON, president of the Minnesota Steel Co., a subsidiary of the United States Steel Corporation, died of heart failure at his home at Duluth, Nov. 22. Mr. Sheldon was born at Manchester, Mass., in

S. B. SHELDON

1868, and was graduated from Massachusetts Institute of Technology. His early experience with the steel industry was with the Otis Steel Co., Cleveland. In 1899 he was made assistant general superintendent of the Joliet Works, Illinois Steel Co. Eighteen months later he was promoted to general superintendent and held that position until 1903. Soon afterward he accepted a position with the Lackawanna Steel Co., as general superintendent, and later was employed by the Bethlehem Steel Co. He returned to the United States Steel Corporation in 1913, becoming identified with the Minnesota Steel Co. at Duluth. In 1920 he was made vice-president and succeeded the late Judge Gary as president.

—

GEORGE SCOBY-SMITH, director and commercial manager, Bolckow, Vaughan & Co., Middlesbrough, England, died Nov. 18, aged 81 years. He was chairman of the North East Coast Pig Iron Central Committee.

—

JOHN A. STEVENS, consulting engineer, died at his home in Lynn, Mass., on Nov. 18, aged 61 years. He served as chairman of the committee, appointed by the American Society of Mechanical Engineers, to prepare a standard boiler code, and during the war was standardization engineer for the United States Shipping Board Emergency Fleet Corporation. He was the donor to the American Society of Mechanical Engineers of the John A. Stevens trust fund for encouraging inventions in conservation of fuels and in generation of light, heat and power.

—

LOUIS DUFFKE, secretary-treasurer of the Nortmann-Duffke Foundry Co., Milwaukee, died in that city, Nov. 18, aged 66 years, following several months of illness. With the late Val Nortmann he established the foundry company in 1890.

—

JOHN S. BRENNAN, for 27 years with A. J. Lindemann & Hoverson Co., Milwaukee, and more recently an executive with the National Enameling & Stamping Co., in the same city, died at Miami, Fla., Nov. 16, aged 61 years, as the result of a fall which fractured his skull.

—

JOSEPH KOENIG, a pioneer in the aluminum industry and founder of the Aluminum Goods Mfg. Co., Manitowoc, Wis., died in that city on Nov. 15.

—

ARTHUR L. SHAW, president, Chicago Automatic Conveyor Co., died on Nov. 15.

—

ROBERT T. HUSTON, vice-president and superintendent of the Connersville Blower Co., Connersville, Ind., died at his home in that city of a heart attack on Nov. 14. He had been connected with the company since its organization in 1893.

Canada's Pig Iron Output Declines; Ingots Gain

TORONTO, ONT., Nov. 26. — Production of pig iron in Canada in October, at 91,409 gross tons, was slightly under the 98,816 tons produced in September, but compared favorably with the total of 93,186 tons reported for October a year ago. For the 10 months ended with October, production of pig iron amounted to 921,096 tons, a gain of 10 per cent over the 838,659 tons made during the corresponding period of 1928.

Production of steel ingots and castings in October amounted to 115,674 tons, a gain of 17 per cent over the production of 99,000 tons in the previous month, and 6 per cent over the total of 108,987 tons reported for October, 1928. For the 10 months ended with October, the output of steel ingots and direct steel castings, at 1,203,635 tons, was the highest reported for any 10 months since the war year, 1918, and was 17 per cent higher than the 1,028,697 tons produced during the corresponding ten months last year.

Production of ferrosilicon and ferromanganese in Canada during October at 7674 tons was 8 per cent greater than the total of 7131 tons reported for the previous month. For the first 10 months of this year, production aggregated 65,606 tons.

October Gain Shown in Ohio Foundry Melt

Foundry operations in Ohio in October increased over September, according to the monthly report of the Ohio Foundries Association, Inc. Based on returns of 40 foundries, the industry was operating in October at 115.6 per cent of normal capacity, compared with 102.5 per cent in September and with 103.89 per cent in October, last year.

British Output in October High for Year

LONDON, ENGLAND, Nov. 25. (*By Cable*).—Pig iron output in October was 688,700 gross tons and that of steel ingots and castings was 889,800 tons. These are records for any month this year. The next best pig iron production was 682,000 tons in August, and in steel the nearest approach to October was the 859,900 tons in March.

—

Comparison of recent output with other periods is as follows:

	Pig Iron, Gross Tons	Steel Ingots and Castings, Gross Tons
1913—Av. monthly..	855,000	638,600
1920—Av. monthly..	669,500	755,600
1922—Av. monthly..	408,500	490,100
1923—Av. monthly..	620,000	706,800
1924—Av. monthly..	609,900	685,100
1925—Av. monthly..	519,700	616,400
1926—Av. monthly..	203,500	296,700
1927—Av. monthly..	607,800	758,200
1928—Av. monthly..	550,900	710,400
1929—Av. first half..	599,600	813,800
1929—August	682,000	753,300
1929—September ...	664,600	847,900
1929—October	688,700	889,800

Mixed Trends in European Markets

Cartels in Greater Favor—Not Much Buying Ahead in British Iron —Finished Steel Well Sought, Except Plates

(*By Cable*)

LONDON, ENGLAND, Nov. '25.

IRON and steel inquiry has increased with the decline in the bank rate, but business is still slow and consumers cautious in buying, because of the uncertain coal situation. Cleveland furnaces are disposing easily of their current output, but early 1930 order books are still largely unfilled.

Less foreign pig iron is arriving, so that makers are less apprehensive and prices are maintained better. Hematite producers have their books well filled, consumers covering requirements into March and prices advancing slowly. Fully £4 1s. ($19.64) per ton has been quoted for mixed numbers on delivery beyond November-December.

Finished steel is quiet, especially for export, but mills are receiving specifications against previous contracts, and order books, except with plate mills, are generally well filled.

Tin plate demand has revived with the stronger tin market and recent Welsh floods, which forced suspension of some mills, resulting in their orders being placed with others. The position of mills is strong, one group being sold out until February-March.

Negotiations are pending between British and Continental mills for an agreement delimiting export markets on a basis similar to the agreement now existing between Welsh and American tin plate producers. Substantially higher prices are expected if the negotiations are successful.

Galvanized sheets are rather more active, but large tonnage orders are still lacking and certain works are unable to secure full specifications. Japanese inquiry for black sheets has improved, but actual business is small.

The Standard Oil Co. has placed an order for a 16,000-ton motor tank ship with the Palmers Shipbuilding & Iron Co., Ltd.

The British Mannesmann Tube Works at Newport has suspended operations as a result of industrial trouble. The claim of the engineering unions for a National wage increase has been refused.

Shareholders of Dorman, Long & Co. have approved the merger with Bolckow, Vaughan & Co., Ltd.

Irregular prices in the Continental markets became firmer on the announcement that the International Rail Makers' Association has allocated 100,000 tons of rails, of which 60,000 tons went to Belgium, but weakened as a result of pressure by certain makers to obtain orders. Demand for Continental products is quiet here, with consumers generally uninterested.

Cartel Prestige Increased

Steel Prices Firmer Following 10 Per Cent Reduction of Output—Machinery Exports Larger

BERLIN, GERMANY, Nov. 10.—Improvement in the steel export market, which appeared early this month, is attributed to the 10 per cent reduction of output authorized by the International Steel Cartel. The reduction in output to a maximum of 29,066,280 tons a year is effective only until the end of the year. Another factor in the improvement of business is the better prospect for renewal of the domestic syndicates and the international cartel. Many buyers had been delaying purchases in the belief that dissolution of the cartels would result in lower prices.

The improvement of business directly following reduction of output by the International Steel Cartel has increased the prestige of that organization considerably, as it is the first time an action of the cartel has been directly traceable to an improved business situation. Export prices have advanced so that steel bars are quoted at from £5 5s. to

*Open-hearth steel, 8s. ($1.94) per ton extra.

£5 7s. 6d. per ton (1.15c. to 1.18c. per lb.) compared with a low price for this year of £5 per ton (1.10c. per lb.). While some foreign consumers are unwilling to pay the advances in prices, Great Britain and the Scandinavian countries have been fairly active buyers.

Domestic business continues quiet with prices unchanged, and certain plants are reducing their personnel considerably. Unemployment is not increasing more rapidly than is normal in the late fall, but the total of unemployed is larger than a year ago. The decline in the American stock exchange is viewed with some apprehension here, as it is pointed out that prolonged depression in the American stock market is usually followed by a general stagnation of world trade. Recently the gross and net exports of steel have been declining. The highest monthly net export (the total shipments less imports) was in April with 464,000 tons; the September total net export was only 322,000 tons.

The machine manufacturing industry is quiet. Inquiry from Russia has begun to improve following a dull period, but the Soviet Union mission in Berlin complains of German credit conditions and prices. Exports of electrical equipment are heavy with a total of 415,000,000 m. in the first nine months of this year compared with 291,000,000 m. in all of 1913, 321,000,000 m. in 1925, 353,000,000 m. in 1926, 399,000,000 m. in 1927 and 488,000,000 m. in all of 1928.

The greatest increases of electrical equipment exports have been to eastern Europe and the near East. Exports to South America have shown but little change. Russian imports of electrical equipment in the past year were 65 per cent from Germany. Recently the Elektricitats-Lieferungs A. G. received an important order from Rumania for the plant and cables to supply the Banat district.

American Industry Catalog Sent to Russia

A catalog of American industry and trade, containing 1000 pages and listing 6500 companies manufacturing equipment of interest to Russia, has been published in the United States by the Amtorg Trading Corporation, New York, and 10,000 copies have been shipped for distribution throughout the Soviet Union. In a foreword, Saul G. Bron, chairman of the board, Amtorg Trading Corporation, says:

> At the present time, the penetration of American technique into Soviet industry, and partly into agriculture, is proceeding at a fast rate. This is evident from the fact that, of the 30 technical assistance contracts with American companies at present in operation, over half have been concluded within the last six months. Another illustration is the growth in the purchases of American industrial equipment for the U. S. S. R., which amounted to $30,000,000 during the fiscal year 1928-1929, two and one-half times the figure of the previous year.

It is further pointed out that in the six years of trade between the Soviet Union and the United States the turnover has been $580,000,000, of which purchases of American products totaled $450,000,000 and sales in the United States $130,000,000, an adverse trade balance for the U. S. S. R. of $320,000,000. The United States, says the foreword, is the only important country with which the Soviet Union has an adverse trade balance.

German Iron and Steel Exports Decline

WASHINGTON, Nov. 22. — German exports of iron and steel in September totaled 414,541 metric tons, compared with 464,819 tons in August, and imports were 114,099 tons in September compared with 117,331 tons in August, according to a cablegram to the Department of Commerce.

The principal items in the September trade were 99,453 tons of iron and steel bars, rods and angles exported and 51,901 tons imported, 67,753 tons of plates and sheets exported and 6532 tons imported, 32,474 tons of rails exported and 7314 tons imported, 31,635 tons of plain wire exported and 8355 tons imported, 16,241 tons of hoops and bands exported and 7590 tons imported. Exports of pig iron and ferroalloys in September totaled only 36,388 tons, and imports were 12,143 tons.

Japan Plans Rail Output and Seeks Exports

YOKOHAMA, JAPAN, Oct. 15.—As the result of improvements in the rail mill of the Seitetsu Jo (Government Works), production of rails has been steadily increasing and output in September, 15,378 tons, was a monthly record. During its present business year the Government works plans to roll 240,000 metric tons of heavy rails, the maximum capacity.

However, the Imperial Government Railways, its largest customer for rails, has announced a reduction of about 45,000 tons in its expected purchases from the Government works, and to offset this, an effort will be made to export rails to China, Siam and other Far Eastern countries. A firm offer is reported to have been received from a Chinese railroad for 35 miles of 60-lb. rails.

Reparations Deliveries Total Over $180,000,000

HAMBURG, GERMANY, Nov. 11.—Since the Dawes plan became effective, Sept. 1, 1924, Germany has shipped on reparations account iron, steel and non-ferrous metal products valued at 314,240,000 m. ($74,789,000) and machinery to the value of 451,650,000 m. ($107,493,000). Of the total shipments, France and French colonies received 58.7 per cent, Belgium 16.7 per cent, Jugoslavia 14.2 per cent, Italy 4.8 per cent, Japan and Portugal each 1.1 per cent and Rumania, Greece and other countries the remaining 3.4 per cent.

Builds Three New Blast Furnaces

HAMBURG, GERMANY, Nov. 11.—Three blast furnaces at the plant of the Buderussche Eisenwerke A. G., Wetzlar, are being dismantled and three new furnaces being constructed with a total annual capacity of 275,000 tons. The first new furnace will go in blast early next year. Work is also proceeding on the construction of new by-product coke ovens.

Russia Buys 40,000 Tons of Bars, Shapes and Plates

HAMBURG, GERMANY, Nov. 11.—The Friedenshutte A. G. in Silesia has booked an order from Russia for about 40,000 tons of bars, shapes and plates, of which 20,000 tons is to be shipped in January and 20,000 tons in March.

German Tin Smelter to Produce Copper

HAMBURG, GERMANY, Nov. 11.—The Zinnwerke Wilhelmsburg, near here, which is controlled by the National Lead Co. and British interests, has entered into a five-year contract, through the American company, for the delivery of tin ore from Bolivia. During the coming year the Zinnwerke will begin smelting copper, adding about 20,000 tons of copper to its tin output of 2000 to 3000 tons. The works is not a member of the copper syndicate.

Germany Made Horseshoes for Washington's Army

HAMBURG, GERMANY, Nov. 11.—An investigation of the German hardware industry which was recently completed shows that the oldest line of hardware manufacture in the country is horseshoe making. Certain of these works have been in existence for more than 200 years. Two such makers have old order books, in which are recorded shipments of horseshoes to the account of French merchants for the Continental Army in the American war of independence.

The oldest German metal works is the Manfeld Kupfer A. G., copper producer, which has been in existence under the same name for about 700 years. The second oldest manufacturer in Germany, one of the largest chain makers, has been in existence for more than 400 years under the same name.

The Bancroft & Martin Rolling Mill Co., Portland, Me., manufacturer of reinforcing bars, is making improvements at its South Portland plant. In addition to new office and yard arrangements, the company will install a warehouse, garage, and later a gasoline and oil distributing plant for the operation of its rolling mill.

Steel Exports Higher in October

Ten-Month Total of Rolled Shows 12 Per Cent Gain Over 1928—Imports Lower in Both Periods

WASHINGTON, Nov. 25.—Making an increase of 25,238 gross tons, exports of iron and steel products from the United States in October aggregated 247,646 tons, against 222,408 tons in September, and 258,774 tons in October of last year. For the first 10 months of the current year shipments of steel to foreign markets were 2,575,281 tons, a gain of 191,445 tons or 8 per cent over the total of 2,384,836 tons for the same period of 1928.

Imports in October, amounting to 63,226 tons, reflected an increase of 2252 tons over those in September, totaling 60,974 tons. For the first 10 months of the current year, however, imports, aggregating 637,392 tons, showed a decline of 19,161 tons from those in the like period of last year.

The average daily movement of exports in October was 7989 tons, compared with 7414 tons in September and 7834 tons in August. The daily average entering the United States in October was 2039 tons, compared with 2032 tons in September and 2709 tons in August.

Increases in exports in October, when compared with September, were general. Scrap again was the largest item, amounting to 47,936 tons, of which 26,636 tons went to Japan, 6615 tons to Canada, 3030 tons to Italy and 3014 tons to Sweden. The largest item of rolled steel exports was plain structural shapes, 30,513 tons, an increase of 9326 tons. Of the October exports, 24,350 tons went to Canada and 3223 tons to Chile.

Exports of tin plate in October were 23,389 tons, an increase of 3479 tons. The largest customer was Japan, which took 8565 tons. Canada took 2662 tons; China, 2226 tons; Argentina, 1995 tons. Of the 16,971 tons of skelp exported in October, a gain of 4835 tons, all but 83 tons went to Canada. Exports of steel bars in October, amounting to 13,077 tons, reflected a decrease of 3922 tons; 6438 tons went to Canada, 2436 tons to the United Kingdom and 1501 tons to Japan.

Of the 11,929 tons of plates exported in October, 9909 tons went to Canada, while that country took 1986 tons of the 9390 tons of galvanized sheets exported, Japan taking 1023 tons. Of the 12,331 tons of black steel sheets exported in October, 7414

tons went to Canada and 1412 tons to Japan. Exports of steel rails in October declined to 8297 tons in October from 10,070 tons in September. The largest foreign market was Brazil, which took 3035 tons, Canada taking 1226 tons and Japan, 929 tons. Of the 3073 tons of hoops and bands exported in October, 2318 tons went to Canada.

Taking a total of 97,091 tons, Canada was as usual the chief outside market for American iron and steel. For the first 10 months of the current year exports to Canada aggregated 1,063,927 tons, compared with 968,301 tons in the corresponding period of last year. Exports in October to Japan, the second largest market, were 43,100 tons, while in the first 10 months they were 330,867 tons, against 350,293 tons in the corresponding period of 1928.

Pig iron was in first position among the items imported in October, incoming shipments totaling 14,295 tons, against 11,013 tons in September. Scrap was next, with 10,748 tons of the total coming from Canada. Imports of structural shapes were 9378 tons, of which 5235 tons came from Belgium, 2190 tons from Germany and 1715 tons from France.

Of the 5944 tons of ferromanganese imported in October, 3042 tons came from Norway and 2068 tons from Canada. Of the imports of 3427 tons of cast iron pipe, 1977 tons came from France and 1442 tons from Belgium. Sweden supplied 1470 tons and Belgium 1016 tons of the 3017 tons of steel bars imported. Of the 24,867 tons of manganese concentrates imported, 12,889 tons came from Brazil, 7009 tons from Soviet Russia and 2080 tons from India.

Unusually large imports of scrap and pig iron from Canada gave that country the leading position as the source of incoming shipments in October, with a total of 18,076 tons. Belgium was second, with 11,374 tons.

Destination of Iron and Steel Exports from the United States

Manganese Ore Producers Not Interested in Cartel

HAMBURG, GERMANY, Nov. 11.—Agents of Brazilian, African and Indian manganese ore producers state that although the Soviet Government is apparently desirous of forming a world cartel of producers, no attempt at such an organization is to be made at present. Competing producers of manganese ore are apparently of the opinion that the Russian mines are being operated at a loss on each ton of ore, based on present selling prices. It is stated that the Soviet Manganese Ore Trust is credited by the State steel producers with considerably more per unit than the mines are receiving from foreign consumers for their manganese ore.

Huge Coke Production Continues

WASHINGTON, Nov. 26.—By-product coke produced in October (31 days) was 4,610,138 net tons, an average daily rate of 148,714 tons, against 147,100 tons in September, according to the Bureau of Mines.

A new plant, that of the Davison Coke & Iron Co., at Neville Island, Pittsburgh, started production on Oct. 1 with a battery of 55 Koppers-Becker ovens. There are now 87 by-product coke plants in active operation, and during October they produced about 92.7 per cent of their capacity.

Production of beehive coke in October was 470,200 tons, compared with 504,300 tons in September.

Production of all coke for the first 10 months of 1929 was 50,230,186 tons, against 43,318,486 tons for the corresponding period of 1928. Of the 1929 coke production, 44,973,386 tons came from by-product plants. Both the by-product coke and total coke made new high records for 10 months.

Quoting THE IRON AGE, the bureau shows that production of pig iron during the first 10 months of the current year was 36,267,442 gross tons, against 31,165,435 tons for the corresponding period of last year; and that 1.385 net tons of coke was made for each gross ton of pig iron in 1929, against 1.39 tons in 1928.

A quarterly review of literature pertaining to vanadium and vanadium alloys and chemical compounds has been started by Vanadium Corporation of America, New York. The publication, called *Vancoram Review*, appears as a 6 x 9-in. pamphlet, and in addition to an inclusive series of abstracts, it is also planned for the publication of technical and scientific data secured by the corporation's own research staff.

Machinery Markets and News of the Works

Machine Tool Orders Decline

November Sales Probably Will Be 20 Per Cent Less Than Those in October

ALTHOUGH there has been a further recession in machine tool sales, many builders are gratified that the volume has held up so well in view of the general apprehension about business and of the usual tapering off as the end of the year approaches.

Reports from machine tool centers throughout the country indicate that bookings this month may run from 20 to 25 per cent less than those in October. If this proves to be the case when the monthly figures are compiled, the industry will feel fairly well satisfied with conditions.

While there has been curtailment of production and consequently of buying in the automobile, radio and airplane industries, new prospects for machine tool business are developing, notably in lines catering to the building construction field.

In fact, the amount of inquiry before the trade is fairly large. Some of the pending orders are expected to be closed soon, but a considerable portion probably will not be acted upon until after the first of the year.

The delivery situation has not improved materially and many builders have sufficient orders on their books to carry along operations in their shops at the current high rate until early spring.

Two shaper manufacturers have announced that prices are to be advanced 10 per cent.

An Iowa farm implement maker has bought a substantial amount of production machinery and will purchase a number of standard tools. The Chicago & North Western, Santa Fe and Kansas City Southern each have contracted for a few tools.

New York

NEW YORK, Nov. 26.—Although machine tool buying has declined this month, some new prospects are developing, notably in the lines of manufacture catering to the building industry. Companies in this field expect that their business will increase early in the new year and they have begun to prepare by inquiring for new equipment. Brakes for steel interior trim manufacture are among the machines sought. A large distributer of machine tools reports that its November sales, according to present estimates, will drop about 20 per cent below those of October. However, most machine tool sellers are quoting on a considerable number of inquiries, some of which may be acted upon quickly while others may go over until after the first of the year.

Aside from the automobile, radio and airplane industries, no market curtailment in metal-working manufacturing has occurred, and many manufacturers, it is reported, are surprised that their volume of business has held up so well in view of the general apprehension which has existed. Among the lines which are particularly active are electrical equipment, various lines of machinery and motor trucks. One purchase of the past week totaled about $25,000.

General Electric Co., Schenectady, N. Y., plans factory branch and distributing plant, four stories, and basement, 80 x 160 ft., with two-story service and equipment repair unit adjoining, at Minneapolis, Minn., to cost over $350,000 with equipment.

Scott Welded Products, Inc., Van Alst and Harris Avenues, Long Island City, has awarded general contract to Bonafide Building, Inc., 276 Jackson Avenue, for one-story addition, to cost about $30,000 with equipment. B. Slavin, last noted address, is architect.

Board of Education, Yonkers, N. Y., has purchased property on Van Cortlandt Park Avenue, about 300 x 824 ft., as site for new multi-story high school, to include manual training department, for which plans will be completed soon, to cost more than $350,000. Richard Edie, Jr., is president of board.

Holler Ice Mfg. Co., New York, care of Sibley & Fetherston, 205 East Forty-second Street, architects, is having plans drawn for one-story ice-manufacturing plant 80 x 150 ft., to cost about $50,000 with equipment.

Dornier Corporation of America, Inc., an interest of General Motors Corporation, Broadway and Fifty-seventh Street, New York, recently formed by officials of that organization, Fokker Aircraft Corporation, Glendale, W. Va., a subsidiary, and Dr. Claude Dornier, head of Dornier Metallbauten, Friedrichshafen, Germany, is arranging purchase of site for new plant to manufacture flying boats, including two and four-motor units. Dr. Dornier is now in United States to complete plans for project, which will cost over $400,000 with equipment. Plane models will be similar to those now being produced by Dornier company in Germany, for which new company has patent rights.

Samuel L. Malkind, 93 Court Street, Brooklyn, architect, has plans for two-story automobile service, repair and garage building, 110 x 250 ft., to cost $100,000 with equipment.

Shell Eastern Petroleum Products, Inc., 122 East Forty-second Street, New York, a subsidiary of Shell Union Oil Co., St. Louis, has filed plans for oil storage and distributing plant at Mount Vernon, N. Y., to cost about $40,000 with equipment.

Department of Water Supply, Gas and Electricity, Municipal Building, New York, is arranging for acquisition of plant of Long Island Water Corporation, Rockaway, and will carry out expansion and betterment program, including installation of pumping machinery and other power equipment, to total $500,000. W. W. Brush is chief engineer.

Richfield Oil Corporation of New York, Inc., Chanin Building, New York, a subsidiary of Richfield Oil Corporation, Los Angeles, will erect oil storage and distributing terminals along New York State Barge Canal. Work on first such unit is under way at Schenectady, N. Y., to have capacity of 110,000 bbl., to cost close to $75,000 with equipment. Other plants will be about similar size.

Jersey Central Power & Light Co., 20 South Street, Asbury Park, N. J., has superstructure under way for steam-operated electric generating plant, 160 x 160 ft., at South Amboy, N. J., to cost $5,000,000 including transmission system. Electric Management & Engineering Corporation, 57 William Street, New York, is engineer.

Van Blerck Motors, Inc., Red Bank, N. J., manufacturer of marine motors and parts, is disposing of a stock issue to total about $310,000, part of proceeds to be used for expansion.

Bell Telephone Laboratories, Inc., 463 West Street, New York, a subsidiary of American Telephone & Telegraph Co., has acquired property at Holmdel, near Red Bank, N. J., and plans experimental laboratory for radio and radio equipment work.

Gilman Corporation, Jersey City, N. J., care of Charles M. Egan, 15 Exchange Place, attorney, recently organized, has plans for a six-story automobile service, repair and garage building, to cost about $125,000 with equipment.

Mono Service Co., Verona Avenue and Oraton Street, Newark, manufacturer of paper cups and containers, has work under way on five-story and basement addi-

tion, 113 x 160 ft., to double present capacity, to cost over $400,000 with machinery. Part of unit will be used for storage and distribution. William Clifford, Jr., 1177 East Grand Street, Elizabeth, N. J., is architect.

Aero Radio Corporation, Maple Shade, N. J., has acquired local factory of Strittmater Corporation for new plant to manufacture radio equipment and parts.

Klingrose Engineering Co. has leased building at 461 Hamilton Avenue, Brooklyn, to manufacture special machinery.

Philadelphia

PHILADELPHIA, Nov. 25.—Quaker City Iron Works Co., Tioga and Richmond Streets, Philadelphia, has awarded contract to Blaw-Knox Co., Widener Building, for one-story unit for storage and distributing service.

United Gas Improvement Co., 1401 Arch Street, Philadelphia, operating electric light and power, and gas properties, has authorized an expansion program to cost about $41,000,000. Of fund noted, about $26,000,000 will be expended by Philadelphia Electric Co. and $2,000,000 by Philadelphia Gas Works, subsidiary organizations, while appropriation of $2,862,000 will be used by Delaware Power & Light Co., Wilmington, for additions and betterments in Brandywine plant and other work in that territory, including $730,000 for installation of submarine cable line from new generating plant at Deepwater Point, N. J., to Wilmington.

Keystone Index Card Co., 3225 Race Street, Philadelphia, manufacturer of commercial card stocks, etc., is planning two-story factory, to cost $40,000 with equipment.

M. B. Whitney, 1734 North Fifth Street, Philadelphia, and associates have organized Nicetown Mfg. Co., to establish plant in Nicetown district for manufacture of pressed, stamped and drawn metal products, also die-stamped specialties. Edward L. Davis, 4250 Wissahickon Avenue, is interested in new organization.

Grinnell Co., Inc., Commercial Trust Building, Philadelphia, manufacturer of sprinklers and sprinkling systems for fire protection, etc., with headquarters at Providence, R. I., has plans by United Engineers & Constructors, Inc., 112 North Broad Street, architect and engineer, for one and two-story plant on site recently acquired, to cost about $140,000 with equipment.

Board of Education, Phoenixville, Pa., is considering installation of manual training equipment in new two-story junior high school to cost over $400,000, for which bids will be asked soon on general contract. Ritter & Shay, Packard Building, Philadelphia, are architects.

Harrisburg Airplane Service, Inc., Harrisburg, Pa., recently organized by Raymond Hartman and George G. McFarland, Harrisburg, and associates, is arranging for establishment of flying school on tract near city limits, with hangar, repair shop and other field buildings. Company will also operate airport at Beaufort Field on Linglestown Road, where similar aircraft units will be established. New organization will represent Curtiss-Wright airplanes for sales and service, parts, etc., in this territory. Mr. Hartman will be president of company, and Roy W. Shreiner, secretary and treasurer.

Harrisburg Gas Co., Harrisburg, Pa., is arranging an expansion and improvement program to cost $368,000, including increased generating and distributing facilities and extensions in service to Rockville, Fort Hunter and vicinity.

Andes, Inc., care of William D. Andes, R. D. No. 3, Lancaster, Pa., recently organized by Mr. Andes and associates, plans operation of local foundry for production of iron and steel castings, machine parts, tools, etc. E. B. and M. E. Andes, Lancaster, will be connected with new company.

Brandt-Warner Co., Broad Street, York, Pa., manufacturer of automobile axles, etc., will soon take bids on general contract for two-story addition, to cost about $45,000 with equipment.

The Crane Market

ALTHOUGH there has not been a noticeable increase in the volume of inquiry for electric overhead cranes, sellers report less inclination by buyers to delay purchases because of the uncertainty of business. Buying has been good in the Middle West and there is some substantial business in prospect in the Pittsburgh district. The Art Stone Co., Millers Falls, Mass., is reported to have closed on a 5-ton, 59-ft. span overhead crane with the Bedford Foundry & Machine Co., and the Monterey Iron & Steel Co., Monterey, Mexico, has purchased some foundry equipment and two 10-ton electric cranes from the Whiting Corporation.

Locomotive crane inquiry is moderately active, especially from the larger industrial users. The New York Central Railroad is reported to have closed on a 50-ton locomotive crane, but action has not yet been taken by the Standard Oil Co. of New Jersey, Anglo-Chilean Consolidated Nitrate Corporation, New York, or the Bethlehem Shipbuilding Corporation, on locomotive cranes, for which they have been inquiring.

Among recent purchases are:

American Steel Foundries, Alliance, Ohio, 10-ton, 67-ft. overhead electric crane from Shaw Electric Crane Works.

American Steel Foundries, Granite City, Ill., 5-ton, overhead electric crane from Shaw Electric Crane Co.

National Automatic Tool Co., Richmond, Ind., two 10-ton, 48-ft. span electric cranes from unnamed bidder.

Locomotive Finished Material Co., Atchison, Kan., one 10-ton, 87-ft. span and two 10-ton, 75-ft. span overhead electric cranes from unnamed bidder.

Western Gas Construction Co., Fort Wayne, Ind., 10-ton, 38-ft. span foundry crane from unnamed bidder.

Illinois Steel Co., 300-ton electric crane from Alliance Machine Co.

Byllesby Engineering & Management Corporation, Chicago, 50-ton overhead powerhouse crane from Whiting Corporation.

Buffalo

BUFFALO, Nov. 25.—Stewart Motor Corporation, 93 Dewey Avenue, Buffalo, manufacturer of motor trucks and parts, has filed plans for one-story addition for service and parts department, to cost about $60,000 with equipment.

Tiffany Machine Works, Inc., Rochester, N. Y., has been formed by David H. Tiffany and associates to manufacture automobile parts and machine equipment. It is understood that new company will take over and expand D. H. Tiffany Corporation, 68 Scio Street, manufacturer of motor parts and mechanical equipment. Halstead R. Tiffany, 125 Falleson Road, will be an official of new company.

Great Atlantic & Pacific Tea Co., 420 Lexington Avenue, New York, is contemplating cold storage warehouse and refrigerating plant at Buffalo, to cost over $85,000 with equipment.

Chase Brass & Copper Co., Waterbury, Conn., has arranged for new factory branch and distributing plant at 25 Ellicott Street, Buffalo. Frederick C. Kaufmann will be local manager, in charge.

John C. Schneiter, Churchville, N. Y., and associates have organized Schneiter Electric Co., with capital of $50,000, and plan operation of factory at Batavia, N. Y., to manufacture electrical equipment and parts. William J. Darch, 203 East Main Street, Batavia, is representative for company.

New York State Electric & Gas Corporation, Ithaca, N. Y., an interest of Associated Gas & Electric Co., 61 Broadway, New York, has acquired Otsego Light & Power Co., Otsego, and will consolidate. Expansion is planned, including transmission line between present systems.

Plant and equipment of General Airplanes Corporation, 618 Northumberland Avenue, Buffalo, have been secured at public sale by H. Paltrowitz, 167 South Street, New York, contractors' supplies and equipment, for $65,000. No announcement has as yet been made regarding continuance of production at present location.

M. J. DeAngelis, 49 East Avenue, Rochester, N. Y., architect, has plans for an automobile service, repair and garage building, to cost about $100,000 with equipment.

New England

BOSTON, Nov. 25.—Machine tool business in this district has fallen off and manufacturers throughout New England state that bookings have dropped perceptibly this month. Prospects give no indication when they will buy, but the feeling is general that the remainder of this year will see little activity. Despite the slowing up in metal-working shops, demand for small tools is good. October sales, however, will not total as large as anticipated.

Warren Telechron Co., Ashland, Mass., will have plans ready about Dec. 3 for a plant addition.

Lindstrom Toy & Tool Co., Bridgeport, Conn., has filed plans for a one-story addition, 40 x 100 ft.

City of South Norwalk, Conn., will ask bids next month on a two-story, 63 x 184 ft. and 67 x 168 ft. junior high school, which will contain a manual training department.

Taunton & New Bedford Copper Co., New Bedford, Mass., has awarded a general contract for a one and two-story addition.

Early next year, city of Westerly, R. I., will ask bids on a two-story and basement junior high and industrial school, 160 x 338 ft., which will contain metal-working departments.

Wilcox Crittendon & Co., Middletown, Conn., has started work on a new foundry, plans for which were prepared by Lockwood Greene Engineers, Inc., New York.

International Silver Co., Meriden, Conn., has awarded general contract to Bartlett-

Brainard Co., 252 Asylum Street, Hartford, Conn., for two and three-story addition, 55 x 320 ft., to cost over $100,000 with equipment.

Walker Ice Co., Worcester, Mass., has filed plans for one-story ice-manufacturing plant, to cost $50,000 with equipment.

City Council, Barre, N. H., plans establishment of municipal airport, including hangars, repair shop and other field units, to cost about $50,000. T. W. Dix, City Hall, city engineer, is in charge.

Hiagh Lumber Co., Burlington, Vt., has plans for two-story wood-working and finishing mill, 65 x 100 ft., to cost about $55,000 with equipment. F. L. Austin, College Street, is architect.

New England Power Association, Worcester, Mass., is arranging expansion and improvement program in hydroelectric and steam-operated electric power plants, transmission system and distributing lines to cost about $20,000,000, of which about $11,000,000 will be expended for development in Vermont and New Hampshire, $6,000,000 in Massachusetts, and $3,000,000 in Rhode Island. Frank D. Comerford is president.

N. D. Cass Co., Canal Street, Athol, Mass., manufacturer of toys, games, etc., is contemplating an addition, to cost about $45,000 with equipment.

Boston & Maine Railroad Co., North Station, Boston, has filed plans for two-story refrigerating and cooling plant at Worcester, Mass., to cost about $65,000 with equipment.

Edgar T. Ward Sons & Co., 44 Farnsworth Street, Boston, iron and steel products, with headquarters at Pittsburgh, will build a one-story local factory branch and distributing plant, to cost about $45,000 with equipment.

South Atlantic

BALTIMORE, Nov. 25.—Glenn L. Martin Co., Baltimore, manufacturer of Government bombers and other type aircraft, is arranging for sale of note issue of $3,000,000, part of fund to be used for expansion, particularly in development of commercial airplanes.

St. Paul Garage Co., Redwood and Light Streets, Baltimore, W. B. Collins, president, will soon take bids on general contract for four-story service, repair and garage building, to cost about $1,000,000 with equipment. Wyatt & Nolting, Keyser Building, are architects; Henry Adams, Calvert Building, is mechanical engineer.

Motor Car Ventilator Co., Suffolk, Va., John K. Beeber, manager, is planning construction of one-story foundry, 60 x 75 ft., for production of brass and aluminum castings, to cost more than $20,000 with equipment.

Columbus Gas & Electric Co., Charleston, W. Va., is considering construction of natural gas pipe line from Kentucky to Martinsville, Dansville, Va., and vicinity, totaling about 600 miles. Entire project will cost about $200,000.

Benedict Coal Co., St. Charles, Va., with headquarters at Sixth and Laurel Streets, Knoxville, Tenn., is considering plans for extensions and betterments in mining properties at St. Charles, including tipple, conveyor and other equipment, to cost about $200,000. Part of work will replace recent fire loss.

A. B. Heaton, 1211 Connecticut Avenue, N. W., Washington, architect, has plans for two-story automobile service, repair and garage building for Washington Railway & Electric Co., Fourteenth and C Streets, N. W., for motor buses, trucks, etc., to cost about $200,000 with equipment.

Board of Education, Columbus, Ga., has engaged Smith & Biggers, Murrah Building, architects, to prepare plans for new industrial school for negroes, to cost about $100,000. T. Firth Lockwood, Murrah Building, architect, will draw plans for extensions and improvements in industrial school on Rose Hill.

Mexican Petroleum Co. of Georgia, Savannah, a subsidiary of Pan-American Petroleum & Transport Co., 120 Broadway, New York, has begun grading for new oil storage and distributing plant, to cost over $850,000 with equipment. S. B. Schapiro is company engineer. Project will include complete oil refinery later.

C. E. Freeman, 269 Boulevard, N. E., Atlanta, Ga., operating Ford automobile agency, has leased two-story and basement building, 105 x 150 ft., to be erected on neighboring site, and will establish service, repair and sales building, to cost about $100,000 with equipment. G. Lloyd Preacher & Co., Mortgage Guarantee Building, are architects.

Water Department, Municipal Office Building, Baltimore, will take bids at once for one-story pumping plant, to cost $40,000 with machinery.

Lynchburg Traction & Light Co., Lynchburg, Va., has plans for car barn and shops, including one-story repair shop, wood-working and paint shops, and one-story service, repair and garage building, 60 x 100 ft., for motor buses, to cost more than $90,000 with equipment. Aubrey Chesterman is company engineer, and Elmer E. Barnard, engineer.

John Evans Welding Co., Sumter, S. C., is considering immediate rebuilding of one-story plant, recently destroyed by fire.

Blue Ridge Aircrafts, Inc., Dr. L. Van Proyen, Public Service Building, Asheville, N. C., president, recently organized, plans hangar with repair shop, oil storage and other field buildings for airport at Brickton, near Asheville, to cost over $40,000.

Detroit

DETROIT, Nov. 25.—Lufkin Rule Co., Hess Street, Saginaw, manufacturer of steel rules, tapes, etc., has plans for a one-story addition, to cost about $25,000 with equipment. F. Beckbissinger, 114 South Jefferson Avenue, is architect.

Board of Water Commissioners, Water Board Building, Detroit, is asking bids until Dec. 4 for four 750-hp. and one 500-hp. electric motors for centrifugal pump service at low lift water plant, Water Works Park Station. George H. Fenkell is general manager and chief engineer.

Chevrolet Motors Corporation, Detroit, has acquired tract, 220 x 827 ft., adjoining plant at Bay City, Mich., and plans several new units to cost more than $200,000 with equipment. S. A. Woodmancy is superintendent at Bay City plant.

Paper Products Mfg. Co., Michigan Avenue, Kalamazoo, has plans for three-story addition, to cost $125,000 with machinery. Vosler & DeLoff, 230 East Kalamazoo Avenue, are architects. H. Schrier is president.

Muskegon Traction & Lighting Co., Muskegon, is arranging an expansion program to cost about $350,000. Work will include remodeling and additions to gas-manufacturing plant, with equipment for artificial gas instead of natural gas, as heretofore. D. A. Powell is vice-president and general manager.

Fisher Body Corporation, General Motors Building, Detroit, has plans for new two-story unit, 75 x 450 ft., at Lansing, to cost more than $200,000 with equipment.

Arctic Ice Cream Co., 3301 Grand River Avenue, Detroit, plans installation of ice-making and refrigerating machinery, conveying and other equipment in two-story and basement plant at Jackson, to cost $140,000 with equipment.

Mitchell & Smith, Inc., Copeland Avenue and Michigan Central Railroad, Detroit, manufacturer of cork and insulating products, has awarded general contract to Austin Co. for three one-story additions, including grinding mill, manufacturing unit, and building for storage and distribution, to cost over $90,000 with equipment.

Department of Public Works, South Haven, has plans for extensions and improvements in municipal electric light and power plant, including additional equipment, to cost about $40,000. Giffels, Hamilton & Weber, Grand Rapids National Bank Building, Grand Rapids, are consulting engineers.

Pittsburgh

PITTSBURGH, Nov. 25. — Generally speaking, the machinery business in this territory is holding up well and local dealers are now inclined to minimize the effects of the recent stock market decline. No commitments of any importance have been cancelled and the larger companies have nearly all expressed their intentions of going ahead with recently announced improvement programs. In fact, some important new projects have come out in the last week which will involve large expenditures of money for machinery, cranes and other heavy equipment. The Weirton Steel Co., Weirton, W. Va., will make important plant additions and betterments, as stated in THE IRON AGE last week. The American Steel & Wire Co. plans extensions to its Pittsburgh district plants, and Spang, Chalfant & Co., Inc., has announced an improvement program for its Etna, Pa., plant.

Orders and inquiries for machine tools the past week have been mostly for single items. However, purchases are being made regularly against the lists of the larger buyers. Railroad buying is not yet a factor in this market.

Titusville Iron Works, Inc., Titusville, Pa., has plans for a one and two-story addition to cost about $175,000 with equipment. Portion of unit will be used as a foundry. J. T. Dillon, Sr., is head.

E. I. duPont deNemours & Co., Wilmington, Del., will carry out expansion at plant at Belle, W. Va., to more than double present capacity of ammonia, methanol and miscellaneous commercial alcohols, entire project to cost over $500,000.

West Virginia Pulp & Paper Co., 230 Park Avenue, New York, has work under way on extensions and betterments in mill at Piedmont, W. Va., to cost about $400,000, including addition to mill waste reduction plant to cost close to one-half of amount noted.

A. E. Rainey, Grove City, Pa., and L. C. Pettler, Beaver Falls, Pa., have organized

Rainey-Pettler Mfg. Co., with capital of $100,000 to operate a plant at Titusville, Pa., for manufacture of tools, metal toys, and kindred products. T. U. Smith, Titusville, is treasurer of company and will represent organization.

Mesta Machine Co., Oliver Building, Pittsburgh, has called a special meeting of stockholders, Dec. 4, to approve an increase in capital from $4,000,000 to $7,000,000, portion of fund to be used for general expansion. G. E. Townsend is secretary.

Union Storage Co., Boulevard of Allies, Pittsburgh, has filed plans for extensions and improvements in power plant, including change from steam to electric operation, to cost more than $80,000 with equipment. Ophuls & Hill, 112 West Forty-second Street, New York, are engineers.

Chicago

CHICAGO, Nov. 25.—Sales of machine tools are tapering slowly. Dealers generally look on November bookings as satisfactory for this time of the year, although the rate so far is about 25 per cent below that in October. A farm implement manufacturer in Iowa has placed sizable orders for production machinery and will buy a number of standard tools. The Chicago & North Western will purchase a 14 x 96-in. grinder and a motor-driven turret lathe and the Santa Fe is taking prices on a 24-in. drill.

The delivery situation has cleared but little in recent weeks. Shipment given this week on a boring mill was 30 weeks. Prices are firm with announcements by two manufacturers of shapers that quotations are to be advanced 10 per cent. The used tool market is quiet; dealers are still unable to find equipment of satisfactory quality.

Naylor Pipe Co., 1230 East Ninety-second Street, Chicago, will build an addition, 70 x 198 ft. Abell-Howe Co., 53 West Jackson Boulevard, is architect.

Plant of Sinko Tool & Mfg. Co., 351 North Crawford Avenue, Chicago, was damaged by fire Nov. 22.

General contract for new office and warehouse for John Deere Plow Co., Moline, Ill., has been awarded to J. H. Hunzinger & Co., Davenport, Iowa. Building will be 138 x 218 ft., five stories and basement and will cost $300,000. Upon completion present warehouse will be discontinued.

George D. Whitcomb Co., Rochelle, Ill., manufacturer of industrial and railroad locomotives, has completed a factory addition, primarily for manufacture of large oil-electric and large gear-drive locomotives. Company contemplates building another addition in near future.

Sloan Valve Co., 4300 West Lake Street, Chicago, manufacturer of valves, steam specialties, etc., has awarded general contract to Thorgersen & Erickson, 228 North La Salle Street, for three-story addition, 125 x 135 ft., to cost about $100,000 with equipment. Alfred S. Alschuler, 28 East Jackson Boulevard, is architect.

Board of Education, Glen Ellyn, Ill., is considering installation of manual training equipment in three-story addition to high school to cost $200,000, for which plans are being prepared by Max Dunning, 304 South Wabash Avenue, Chicago, architect.

City Council, St. Paul, Minn., will soon take bids for municipal airport units, including hangar, 115 x 200 ft., repair and reconditioning shops, automobile service and garage building and other structures, to cost $100,000 with equipment. Harry S. Bronson, City Hall, is acting city architect.

Great Northern Railway Co., St. Paul, Minn., is planning an addition to grain elevator at Superior, Wis., including elevating, conveying, screening and other equipment for a capacity of 3,000,000 bu., to cost over $850,000.

Colorado Dry Ice Co., 1712 Welton Street, Denver, has plans for a one and two-story factory, 55 x 110 ft., to cost about $35,000 with equipment, on site at 955 South Logan Street.

City Council, Red Wing, Minn., is considering construction of a municipal electric light and power plant, to cost more than $75,000 with equipment. It is proposed to hold special election to vote bonds. S. T. Irvine is city clerk.

Norton Co., 11 North Jefferson Street, Chicago, manufacturer of abrasive products, with headquarters and main plant at Worcester, Mass., will soon begin superstructure for two-story plant, 160 x 280 ft. General contract has been let to Ford & Phillips, 559 West Van Buren Street. Mundie & Jensen, 39 South La Salle Street, are architects.

Board of Education, Burlington, Iowa, plans installation of manual training equipment in new two-story high school to cost about $250,000, for which bids will be asked on general contract early in December. C. L. Ritts, Eisfeld Building, is architect; W. B. Ittner, Board of Education Building, St. Louis, is consulting architect.

L. G. Hallberg, 116 South Michigan Avenue, Chicago, architect, has plans for a two-story automobile service, repair and garage building at Evanston, Ill., to cost about $150,000 with equipment.

Standard Oil Co., 910 South Michigan Avenue, Chicago, will soon begin construction of two-story oil storage and distributing plant at Robinson, Ill., to cost close to $50,000 with equipment.

Milwaukee

MILWAUKEE, Nov. 25.—Some further recession has taken place in the machine tool trade, but this is largely due to the season and the approach of inventory taking. No marked reduction is noted in the output of metal-working industries. While automobile production has improved only slightly, there is considerable activity among manufacturers of tractors, excavating machinery, electric and steam power generating machinery and parts for motor trucks and tractors, with no changes noted in expansion programs. The drop in radio manufacturing has had only slight effect on a few small metal-working plants, but has forced some curtailment in wood-working factories. Inquiries are in normal volume for the season and point to a revival of machine tool business after the first of the year. Deliveries are reported considerably improved.

Benz Industrial Products Co., 1048 Third Street, Milwaukee, manufacturer of factory supplies, is taking bids on plans by George Zagel & Brother, 144 East Wells Street, Milwaukee, for erection of a factory to cost about $50,000.

Merrill Wood Products Co., Merrill, Wis., manufacturer of toys, novelties, handles and other hardwood products sustained an estimated loss of $50,000 by fire in its main factory and warehouse. Plant probably will be rebuilt, and practically all equipment will require replacement.

Bass Brothers, 1231 Thirty-first Street, Milwaukee, refiners and dealers in scrap metal, have started construction of a two-story addition, 50 x 135 ft., costing about $30,000 with equipment.

Milwaukee Electric Crane & Hoist Corporation, 5921 Greenfield Avenue, West Allis, has plans for a shop addition, 50 x 60 ft.

Milwaukee Department of Public Works, City Hall, is taking bids until Dec. 2 for construction and installation of a 1,500,000-gal. elevated steel tank for city water department, costing about $120,000. David McKeith is commissioner of public works.

Chase Brass & Copper Co., Waterbury, Conn., has opened a branch office and warehouse at 340 East Water Street, Milwaukee, in charge of C. W. Baker, heretofore of Chicago.

Cincinnati

CINCINNATI, Nov. 25.—Demand for machine tools in this district declined the past week, the sharpest recession being in the smaller tools. District manufacturers, basing their opinions upon the present flow of inquiries, are optimistic regarding the future. With unfilled orders still heavy, manufacturers are maintaining operations at a high level.

Kansas City Southern Railroad placed an order with a local manufacturer for two engine lathes and a Michigan buyer purchased four medium-sized lathes.

Lunkenheimer Co., Carthage, Ohio, manufacturer of valves, steam specialties, etc., has awarded general contract to Ferro Concrete Construction Co., Third and Elm Streets, Cincinnati, for one-story addition, to cost about $30,000 with equipment.

Board of Trustees, University of Cincinnati, Burnet Woods Park, is contemplating new power plant on campus to cost about $85,000, in connection with group of college structures to cost more than $600,000, for which architect will soon be selected.

Geyer & Neuffer, Ludlow Arcade Building, Cincinnati, architects, have plans for one-story, L-shaped automobile service, repair and garage building, 84 x 148 x 428 ft., to cost about $100,000 with equipment.

Farmer & Co., Inc., Chattanooga, Tenn., organized recently by Lovell J. Morris, Volunteer Building, and associates, is considering establishment of plant to manufacture steel plates for railroad crossings and kindred products. Building will be purchased or leased.

East Tennessee Light & Power Co., Bristol, Tenn., formerly known as Tennessee Central Service Co., an interest of Henry L. Doherty & Co., 60 Wall Street, New York, will issue bonds for $5,500,000 and 51,000 shares of stock, proceeds to be used in part for acquisition of Bristol Gas & Electric Co., Bristol; Erwin Electric Light & Power Co., Erwin Tenn., and other properties, and for extensions and improvements in plants and system.

Nashville, Chattanooga & St. Louis Railway Co., Nashville, Tenn., has filed plans for addition to engine house, with repair facilities, to cost $20,000. Hunter McDonald is chief engineer.

C. O. Sherrill, City Hall, city manager,

Cincinnati, is considering one-story municipal automobile service, repair and garage building for city-owned cars and motor trucks, to cost over $200,000 with equipment.

Brown-Brockmeyer Co., 10 Norwood Avenue, Dayton, Ohio, manufacturer of fractional horsepower motors, parts, etc., is considering new plant on Overbrook Street, first unit to be one story, 80 x 500 ft., to cost about $100,000 with equipment.

Indiana

INDIANAPOLIS, Nov. 25.—South Bend Tool & Die Co., 1918 South Main Street, South Bend, has awarded general contract to Ralph Sollitt & Sons, 518 East Sample Street, for one-story addition, 35 x 85 ft., to cost $23,000 with equipment. Fett, Pearson & Goffeney, Associates Building, are architects.

R. S. Holland, Milwaukee, formerly connected with National City Products Co., same city, manufacturer of metal castings, etc., is organizing company to establish plant at Fort Wayne for production of brass, bronze, aluminum and similar castings. Local building has been secured. Fort Wayne Chamber of Commerce, J. B. Wiles, manager, is interested in project and has detailed information.

Auburn Automobile Co., Auburn, has awarded general contract to William A. Sheets Construction Co., Cal-Wayne Building, Fort Wayne, for two two-story additions, 200 x 240 ft., and 22 x 275 ft., to cost $220,000 and $70,000, respectively, with equipment. Last-noted will be used primarily for storage and distribution. A. M. Strauss, Cal-Wayne Building, Fort Wayne, is architect. E. L. Cord is president.

Fire King Stoker Co., 1159 Roosevelt Avenue, Indianapolis, has recently taken over heavy-duty branch of Dayton Stoker Co., Dayton, Ohio, and will consolidate with its organization to round out line of mechanical stokers and parts. Purchasing company is considering expansion, including addition to Indianapolis plant.

Noblitt-Sparks Industries, Inc., 603 East Washington Street, Indianapolis, manufacturer of children's vehicles, toy wagons, etc., and automobile accessories, is arranging for increase in capital, part of proceeds to be used for expansion. Company is now operating branch plants at Greenwood, Columbus and Seymour, Ind.

Showers Brothers Co., Bloomington, manufacturer of kitchen cabinets, etc., is planning addition to cost about $55,000 with equipment.

Board of Education, Gary, is considering installation of manual training equipment in three-story high school to cost about $1,000,000, for which bids will be asked soon on general contract. W. B. Ittner, 911 Locust Street, St. Louis, is architect.

Expansion, which will double production of Superior Body Corporation, Marion, has been announced by John E. Sisson, secretary, following reorganization of business. Arthur Hughes, Mansfield, Ohio, is president. Mr. Sisson will be general manager and Ray Hines, treasurer. Ed. Walsh, who has been connected with company since its organization in 1921, is vice-president.

Plant of Hurwich Iron Co., South Bend, recently destroyed by fire, will be rebuilt at a cost of about $40,000, exclusive of equipment.

J. D. Adams Mfg. Co. of Indianapolis, manufacturer of road construction and maintenance machinery, has purchased a road grading equipment plant at Paris, Ontario. The subsidiary firm will be known as the J. D. Adams Co., Ltd.

St. Louis

ST. LOUIS, Nov. 25.—Chicago, Rock Island & Pacific Railroad Co., La Salle Street Station, Chicago, will soon break ground for one-story addition to engine house and repair shops at Kansas City, Kan., 115 x 130 ft., to cost $50,000 with turntable and equipment. A. T. Hawk, address noted, is engineer.

Walter O'Bannon Co., 400 South Rockford Avenue, Tulsa, Okla., manufacturer of oil pumps, parts, oil-well tubing, etc., is planning one-story addition, to cost about $25,000 with equipment.

Missouri-Kansas-Texas Railroad Co., St. Louis, is arranging a fund of about $1,000,000 for car and locomotive shop expansion and improvements, including additional equipment and tools. An appropriation of $7,000,000 will be allotted for line extensions, way structures and equipment during year.

Pittsburgh Equitable Meter Co., Kennedy Building, Tulsa, Okla., manufacturer of gas and water meters, parts, etc., with main offices and plant at 400 Lexington Avenue, Pittsburgh, has asked bids on general contract for one-story factory branch and distributing plant, 50 x 150 ft., at Tulsa, to cost about $50,000 with equipment. Rush, Endacott & Goff, New Wright Building, Tulsa, are architects; Southwest Engineering Co., 910 North Elwood Street, is engineer.

Bird Wing Commercial Aircraft Co., Rosecrans Field, St. Joseph, Mo., is contemplating erection of one-story plant for parts manufacture and assembling, to cost about $60,000 with equipment. C. Wolfley is general manager.

Sides Airway Corporation, Stuart Building, Havelock, Neb., has plans for a hangar, with repair facilities and other field units, to cost about $100,000 with equipment. Davis & Wilson, 525 South Thirteenth Street, Lincoln, Neb., are architects.

Board of Public Utilities, Kansas City, Kan., has plans for extensions in municipal electric light and power plant and waterworks, including installation of additional equipment, to cost more than $100,000. Burns & McDonnell Engineering Co., Interstate Building, Kansas City, Mo., is consulting engineer.

Phoenix Sand & Gravel Co., Bagnell, Mo., has acquired island in Osage River for new sand and gravel plant, including installation of power equipment, elevating, conveying and other machinery, to cost more than $30,000.

Board of Education, Seminole, Okla., is considering installation of manual training equipment in new two-story high school to cost more than $200,000, for which bids will soon be asked on general contract. Hawk & Parr, First National Bank Building, Oklahoma City, Okla., are architects.

Cleveland

CLEVELAND, Nov. 25.—Machine tool sales were light the past week, business not holding up to the volume that came out the first half of the month. Orders were mostly for single machines from diversified industries. The Thew Shovel Co., Lorain, purchased several used machines, including a 72-in. planer and two or three large turret lathes. One northern Ohio inquiry is pending for about a half dozen large machines. Some complaint is being heard that competitive conditions are resulting in offers of excessive trade-in prices for used machinery. With the slowing down of various metal-working industries and in view of the fact that December is usually a slow month in machine tool sales, a quiet market is looked for during the remainder of the year.

Wheeler Metal Products Co., 1637 Collamere Road, Cleveland, has awarded general contract to A. A. Lane Construction Co, city, for one-story addition, 80 x 300 ft., to cost $140,000 with equipment.

Willard Storage Battery Co., East 131st Street and St. Clair Avenue, Cleveland, manufacturer of electric storage batteries, has awarded general contract to Albert M. Higley Co., Plymouth Building, for one-story addition, to cost about $45,000 with equipment.

International Steel Corporation, Canton, Ohio, has secured long-term lease on former local plant of Canton Steel Foundry Co. Extensions and improvements will be made, including installation of new equipment.

Ohio Nut & Bolt Co., Berea, Ohio, has plans for one-story addition, 45 x 160 ft., to cost about $45,000 with equipment. John W. Bagley, 1706 Euclid Avenue, Cleveland, is architect.

Alliance Drop Forge Co., Alliance, Ohio, recently organized by local interests, has begun construction of one-story plant unit, to cost about $50,000 with equipment. Company has arranged for paid-in capital of $75,000. Local Chamber of Commerce is interested in project.

Board of Education, Mentor School District, Mentor, Ohio, is considering installation of manual training equipment in addition to high school, to cost about $200,000. Miller & Son, 27 West Madison Street, Youngstown, are architects.

Lakewood Automobile Co., 16009 Detroit Avenue, Cleveland, has awarded general contract to Charles Peterson Construction Co., 4500 Euclid Avenue, for one-story service, repair and sales building, 140 x 145 ft., to cost about $140,000 with equipment.

Youngstown Steel Car Door Co., which recently transferred manufacturing operations from Cleveland to a new plant in Youngstown, has plans for an addition, on which work will start soon.

Gulf States

BIRMINGHAM, Nov. 25.—City Council, Baton Rouge, La., has plans for municipal airport, including hangars, repair shops, oil storage and other field units, to cost $160,000 with equipment. Jones, Roessle & Olschner, Reymond Building, are architects.

Southwestern Public Service Co., Amarillo, Tex., has plans for extensions and improvements in local steam-operated electric generating plant, including installation of equipment. Company also plans similar expansion in steam-operated electric station at Pampa, Tex., with additional equipment, entire project to cost more than $150,000. Company is a subsidiary of American Commonwealth Power Corporation, 120 Broadway, New York.

Curtiss Flying Service, Inc., 27-29 West Fifty-seventh Street, New York, has awarded general contract to J. F. Russell

Construction Corporation, Bloom and Brook Streets, Louisville, for airport buildings at Dalworth field, Dallas, Tex., to cost about $90,000 with equipment.

Central Power & Light Co., Frost National Bank Building, San Antonio, Tex., has plans for cold storage and refrigerating plant at San Benito, Tex., to cost about $35,000 with machinery. Plans are also being drawn for ice-manufacturing plant at Raymondville, Tex., to cost about $70,000 with machinery. John M. Marriott, Frost National Bank Building, is architect.

Dallas Power & Light Co., Dallas, Tex., is arranging for a preferred stock issue totaling about $1,500,000, part of fund to be used for expansion in steam-operated electric power plant, including transmission lines.

Luthy Aircraft Co., Jackson, Mich., is contemplating establishment of plant at Petersburg, Fla., including departments for parts manufacture and assembling, to cost more than $50,000 with equipment. Company is considering removal of plant from Jackson to new location, where production will be concentrated.

Galveston Wharf Co., Galveston, Tex., has awarded general contract to Jones & Hertelesater, Inc., Kansas City, Mo., for construction of new grain elevator on local site. It will include elevating, conveying, screening and other mechanical equipment, and will cost $2,850,000.

City Commission, Jacksonville, Fla., will receive bids until Dec. 9 for two 333-kva., transformers, spares, storage battery equipment, etc., for municipal substation. M. W. Bishop is secretary.

American Brown-Boveri Electric Corporation, 420 Lexington Avenue, New York, manufacturer of heavy electrical machinery, parts, etc., with main plant at Camden, N. J., is negotiating with Associated Factories Corporation, Dallas, Tex., Judge John M. Spellman, vice-president and counsel, for establishment of plant near Dallas to build dirigible airships, including operation of a dirigible passenger ship line. Initial work will comprise construction of two such units, each of 6,500,000 cu. ft. displacement, with capacity of 120 passengers. Project will cost about $15,000,000.

City Council, Austin, Tex., is planning bond issue of $70,000 for establishment of municipal airport, including hangars, repair shop, and other field structures. Adam R. Johnson is city manager, in charge.

Toronto

TORONTO, Nov. 25.—The machine tool trade has been affected by curtailment in the automotive industry, but demand from locomotive and car building companies is holding at a satisfactory level. Replacement buying is fairly active throughout the Dominion, and some small tool lists are appearing. Betterment in the call for wood-working tools has developed and small tools are moving freely.

Nelson River Construction Co., 124 Pears Avenue, Toronto, has purchased property at Leaside, Ont., and contemplates building a factory next spring.

Trane Co., 439 King Street, West, Toronto, manufacturer of pumps and pumping apparatus, has purchased a site at Leaside, Ont., and will start work early next year on a manufacturing plant to cost $100,000.

Several contracts have been awarded for an addition to factory of Steel Equipment Co., Ltd., 360 Steel Street, Pembroke, Ont., to cost $30,000. Walter Beatty Estate, 125 Pembroke Street, is general contractor.

Contract for a two-story addition to plant of International Nickel Co. of Canada, Ltd., at Port Colborne, Ont., has been awarded to Fraser Brace Engineering Co., Ltd., 107 Craig Street, Montreal.

Quebec Gas & Electric Co., Three Rivers, Que., has let contract to Page Equipment Co. for an artificial gas manufacturing plant.

Steel Trough & Equipment Co., James Street, Tweed, Ont., will start work next spring on erection of a plant at Hamilton, Ont.

Western Canada

J. J. Herb, president of New Westminster Paper Co., New Westminster, B. C., states that some contracts for rebuilding its plant on north arm of Fraser River have been placed. Others, including machinery and equipment, will be awarded soon. Plant will cost $800,000 and will include finishing building, machine room, shipping wharf, etc. R. F. Arnett is architect.

Erection of a sawmill on Lulu Island, New Westminster, B. C., to cost $200,000, is contemplated by J. L. Galbraith, 303 Queen's Avenue, New Westminster.

Pacific Coast

SAN FRANCISCO, Nov. 21.—San Francisco Galvanizing Works, Inc., 1176 Harrison Street, San Francisco, has awarded general contract to Sorensen & Haggmark, 2652 Harrison Street, for extensions and improvements to cost about $25,000. Dodge Reidy, 821 Market Street, is architect.

Gaffer & Sattler, East Forty-ninth Street, Los Angeles, manufacturers of iron castings, have awarded general contract to William P. Neil Co., 4818 Loma Vista Avenue, for one-story foundry addition, 60 x 60 ft., to cost about $24,000 with equipment. Lawrence Nowell, 4818 Loma Vista Avenue, is engineer.

Mutual Income Properties, Inc., Union League Building, Los Angeles, John Boos, president, has awarded general contract to Roy Brown, Union League Building, for a ten-story cold storage and refrigerating plant in San Pedro Harbor district, to cost over $1,000,000 with machinery. F. A. Brown, 1489 West Washington Street, is architect.

Pacific Lumber Co., Scotia, Cal., has awarded general contract to Mercer-Fraser Co., Eureka, Cal., for a new plant unit to cost about $300,000, with conveying, hoisting and other mechanical-handling equipment. Company engineering department is in charge.

Washington Electric Co., Seattle, has secured permit for hydroelectric generating plant on Columbia River, near Wenatchee, Wash., to develop capacity of 60,000 hp., to cost over $2,000,000 with transmission system. Willis T. Batchellor, Dexter-Horton Building, Seattle, is consulting engineer.

Western Products Co., Salem, Ore., will soon begin work on paperboard mill on local site, consisting of several units, to cost more than $450,000 with equipment. L. A. DeGuere, Wisconsin Rapids, Wis., is engineer.

Gray & Danielson Radio Co., San Francisco, plans rebuilding part of factory destroyed by fire Nov. 19.

Allen Lockheed, Los Angeles, formerly head of Lockheed Aircraft Co., recently sold to Detroit Aircraft, Inc., Detroit, is at head of project to construct a new plant on local site for production of airplanes and parts, including assembling department. Permission has been secured to sell about 200,000 shares of stock to provide funds for project. Malcolm Lockheed will also be interested in new organization.

Monterey Ice Delivery Co., Monterey, Cal., a subsidiary of Union Ice Co., 354 Pine Street, San Francisco, has plans for one-story ice-manufacturing plant, to cost about $50,000 with machinery. Engineering department of parent company is in charge.

Foreign

ESTABLISHMENT of plant near Moscow, Russia, for production of both razor handles and blades, is under consideration by Gillette Safety Razor Co., 15 West First Street, Boston. William J. McCarthy and Clarence S. Grey, officials of company, are now abroad to arrange details.

Norsk Hydro Co., Oslo, Norway, is arranging for increase in capital from 76,852,800 kroner (about $19,213,000) to 104,999,940 kroner (about $26,249,900), part of fund to be used for expansion and improvements at nitrogen fertilizer manufacturing plant.

Secretary of Public Works and Tenders Board, Wellington, New Zealand, will receive bids until Jan. 28 for three 50-kva. oil-immersed circuit breakers, with spare parts, etc.; until March 4 for structural steel, steel screens and kindred products.

Soviet Russian Government, Moscow, is arranging for reorganization of aluminum industry in country, with plant expansion and improvements to develop output of 20,000 tons per annum at end of five-year program. Entire project will cost about $15,000,000. Amtorg Trading Corporation, 261 Fifth Avenue, New York, is official buying agency in United States.

Oberkoks Chemical Co., Berlin, Germany, has concluded agreement with E. I. duPont deNemours & Co., Wilmington, Del., for participation of latter in lacquer manufacturing plant of Oscar Mosebach, Riesa, Saxony, a subsidiary. Last-noted company will increase capitalization and carry out expansion for production of lacquers under duPont patents, with installation of additional equipment.

A company at Nyslott, Finland, is planning construction of large plywood manufacturing plant, to replace factory recently destroyed by fire. Installation will include about 15 milling machines, glue presses, mechanical drying equipment, saws and other tools, and it is anticipated will be purchased in United States. Information at office of Bureau of Foreign and Domestic Commerce, Washington, reference Finland No. 319335.

International Railways of Central America, 11 Broadway, is contemplating purchase of rolling stock and equipment for new line between Guatemala and Salvador systems, now nearing completion, to cost about $400,000.

New Trade Publications

Metal-Working Machines.—Niagara Machine & Tool Works, Buffalo, N. Y. Eight-page bulletin illustrating and describing various types of machines for a number of production uses, including particularly aircraft manufacture.

Air Heaters.—Gehnrich Oven Co., Inc., Long Island City, N. Y. Folder of

four pages illustrating and describing indirect gas-fired industrial heaters in three sizes for temperatures up to 250 deg. Fahr., with gas consumption ranging from 200 to 600 cu. ft. an hour. These heaters are 44 in. deep and 58 in. high, with widths of 24, 44 and 64 in.

Washfountains.—Bradley Washfountain Co., 2203 Michigan Street, Milwaukee, Wis. Booklet of 16 pages, illustrating and describing various types and sizes of fountains for washroom use. List of users is given.

Ovens. — Despatch Oven Co., Minneapolis, Minn. Two four-page illustrated bulletins, Nos. 80 and '81, describe installations of various types of oil, gas and electric foundry ovens for the baking of cores and molds.

Steel Castings.—Nugent Steel Castings Co., Chicago. Illustrated two-page bulletin, No. 122, describes how a tractor manufacturer settled the spade lug question by the use of electric alloy steel castings. The bulletin discusses in particular "Nuloy," an alloy steel casting especially adapted where good strength, resistance to shock and resistance to abrasion are required.

Case Hardening. — Case Hardening Service Co., Cleveland. What is claimed as the first general catalog of heat-treating materials which has been produced is offered in an elaborate 20-page bulletin entitled "Supplies and Accessories for Heat-Treating Plants." The catalog describes Bohnite, Non-Case, Caseite, Drawite Salts, Bathite Salts, Pressed Steel Pots, Cleancoat, and Electric Hevi-Duty Furnaces.

Worm-Gear Speed Reducers.—Gears & Forgings, Inc., Cleveland. Bulletin C, 48 pages. Outlines the advantages of worm gear units, and describes and illustrates constructional details and typical installations. Ratings and dimensions of the various types and sizes manufactured are included, and data are given on G & F worm hobs.

Lathes.—South Bend Lathe Works, South Bend, Ind. Bulletin No. 9, 20 pages, devoted to the new 9-in. lathe, and bulletin No. 22, 20 pages, describing the new 9-in. Junior lathe. Both are back-geared screw-cutting machines and can be furnished with several types of drives, legs and lengths of bed. In addition to specifications and prices, data are given on the construction, manufacture and uses of these machines. Attachments for milling, keyway cutting and grinding are also shown.

Die Sets and Accessories.—Danly Machine Specialties, Inc., 2014 South Fifty-second Avenue, Chicago. Sixth edition of catalog and data book on die sets and die makers' supplies. A complete line of reverse die sets, and a new shoulder guide post or leader pin and bushing, are included. A chart shows the various sizes and makes of punch presses which may be employed for the different sizes of large die sets.

Governors. — Massey Machine Co., Watertown, N. Y. Catalog No. 27, devoted to the construction and action of the class W engine governor and the company's speed regulator.

Press Brakes.—Cincinnati Shaper Co., Cincinnati. Loose-leaf booklet devoted to construction and specifications of the company's No. 120 and No. 70 series all-steel press brakes. Several outstanding applications are illustrated, and sections are devoted to a list of representative users and products being made on these machines.

The Week's News Quickly Told

Current Events That Bear on the Course of Business

"COORDINATION of business and governmental agencies in concerted action for continued business progress," was the aim of several conferences called by President Hoover . . . He was assured by labor leaders and leading employers that wage rates will remain stabilized . . . He asks Governors to encourage public works in the States, counties and cities . . . Treasury department will recommend to Congress a $423,000,000 building program for the next decade.

* * * * *

RAILROAD executives will increase rather than abandon any part of their betterment programs, said R. H. Aishton, president American Railroad Association . . . President Hoover urged Interstate Commerce Commission to expedite consolidations, to permit further railroad reconstruction . . . Automatic train control and visual cab signals will be installed on all Pennsylvania main lines west of Pittsburgh . . . In New York all Grand Central approaches will be made "two-way" tracks, to handle a three-fold increase of traffic since the terminal was constructed . . . Weekly freight car loadings showed half the usual seasonal decline of about 50,000.

* * * * *

ROAD and street construction aggregating $2,200,000,000 is projected for 1930 . . . Los Angeles traffic commission reported that subways are necessary to relieve congestion in center of city . . . Much unemployment exists among building trades in the Central States . . . Chicago lathers' union demands privilege of naming foremen.

* * * * *

WAGE increase on a percentage basis for about 100,000 employees is announced by Henry Ford . . . Ford assembly plants throughout the country will close, "pending adjustments for 1930 business," as soon as stocks of parts are consumed . . . Automobile finance companies report no increase in delinquent payments . . . Several thousand tire retailers organize a central purchasing organization to obtain larger discounts . . . Raw rubber is lower. Efforts of Dutch growers to control production of crude fail because 40 per cent of world's supply is gathered by unorganized Asiatics.

* * * * *

RETAIL trade is cautious. Department store sales in the East are somewhat better than in the Central States and South. . . . Percy S. Straus, vice-president of Macy's (New York) and affiliated stores in Newark, N. J., Atlanta, Ga., and Toledo, Ohio, said that "Since the stock market panic has not thus far seriously interfered with business, there is no prospect that it will." . . . Some 9,000,000 Christmas Clubs will return $600,000,000 this year, about 10 per cent more than 1928.

STOCKS, grain and cotton are steady at higher quotations . . . Wheat prices are 14c. above the recent low point—Winnipeg prices are 10c. higher than Chicago . . . Index of wholesale commodity prices is up slightly, checking a steady decline since July . . . Michigan fruit packers and cold storage plants organize into a cooperative, controlling 90 per cent of the pack.

* * * * *

TEXTILE manufacturing is slower not only in America but in nearly all foreign weaving centers . . . New England cotton mills are operating at about 60 per cent of single shift. Acushnet mill, the third oldest in New Bedford, operating 102,000 spindles, votes to liquidate, having passed dividends for two years . . . National Wool Marketing Association is formed under guidance of Federal Farm Board, to market wool and mohair direct from growers to spinners.

* * * * *

ARGENTINE Republic and Great Britain have arranged preferential tariffs on rayon goods and wool mixtures southward, and on grain and meat northward . . . The former country continues its policy of non-cooperation in Pan-American movements sponsored by the United States by failing to reply to sanitary conference pourparlers . . . Pension law in Uruguay requires public works and utilities to employ persons over 45 to the extent of 10 per cent of the payroll.

* * * * *

MONEY appears to be plentiful in most financial centers . . . Business and banking throughout each of the 12 Federal Reserve Bank districts are in a sound condition. Brokers' loans decreased sharply last week, bringing total reduction of $3,217,000,000 since peak on Oct. 7 . . . Federal Reserve Bank (New York) reduced its rate to 4½ per cent, and the Bank of England reduced its discount rate ½ per cent for the second time in three weeks, it now being 5½ per cent . . . Japan, having stabilized its currency, announced that it will lift the embargo on gold shipments Jan. 11 . . . Taxes in France are producing a surplus of about 350,000,000 francs a month. This is being used to deflate the currency and to improve industrial and agricultural equipment. Tax reduction and soldiers' pensions are topics of popular discussion.

* * * * *

RUSSIAN armies have advanced into Manchuria from both eastern and western portals of the Chinese Eastern Railroad . . . Former Secretary of State Kellogg, speaking in London, said that three things are necessary to uphold the peace treaties, viz, educate the people to the advantages of peace, promote conciliation and arbitration agencies, and limit armaments.

ESTABLISHED 1855

VOL. 124, No. 23

Meeting More Rigid Specifications

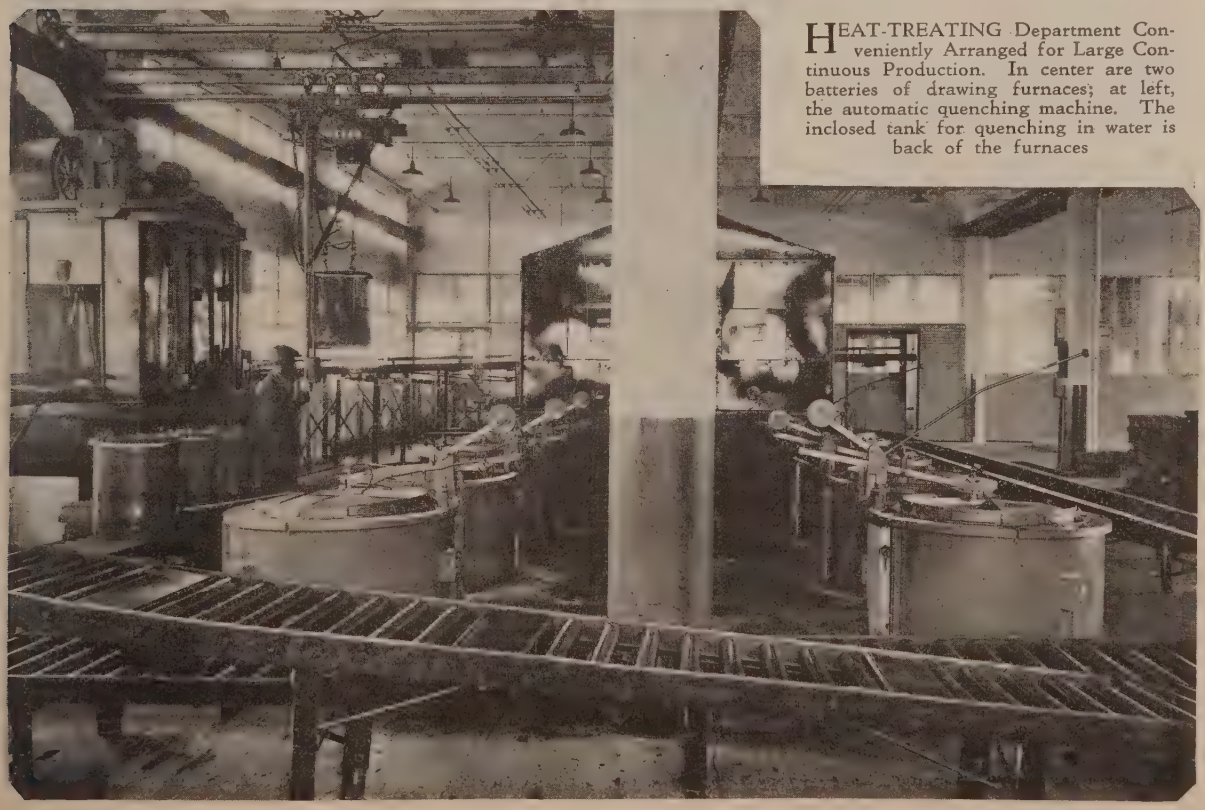
New Heat-Treating Equipment for Bolts Designed for Accurate Control and Large Output— Plating Room Flexible

BY FRED L. PRENTISS*

TO effect close control of its heat-treating operations in the manufacture of bolts, to produce a product uniform in quality and to meet the more rigid specifications of consumers as to physical properties, the Lamson & Sessions Co., Cleveland, recently placed in operation a new heat-treating department equipped with electrically operated drawing furnaces, in which all cold-headed work except stove bolts are heat treated. Interesting features of this department include a compact and efficient arrangement of the equipment, an automatic quenching machine designed to assure uniformity and quality of product and the provision of roller tables and overhead handling equipment to reduce labor to a minimum.

The company has added a plating department which shares, with the heat-treating department, the fourth floor of a new 80 x 140-ft. manufacturing building. While the two departments are separated by a partition, they are connected by roller conveyors for carrying to the

*Resident editor, THE IRON AGE, Cleveland.



HEAT-TREATING Department Conveniently Arranged for Large Continuous Production. In center are two batteries of drawing furnaces; at left, the automatic quenching machine. The inclosed tank for quenching in water is back of the furnaces

plating department, after drawing and quenching, work which is to be plated.

More exacting demands of consumers of steel in various forms have spurred manufacturers of bolts as well as of other steel products to improvements in processes and methods. At the same time competition has been an incentive for introduction of better manufacturing methods to reduce production costs. Bolts regarded as satisfactory not long ago do not meet present specifications of many buyers, particularly in the automotive field.

Formerly buyers were satisfied with bolts having a tensile strength of 45,000 to 50,000 lb. per sq. in. Now there is a tendency to demand a product with a tensile strength of 80,000 lb. and higher in plain carbon steel, and up to 125,000 lb. per sq. in. in alloy steels. Buyers have become more particular, also, in respect to tolerances of the other physical properties, particularly hardness, resulting in specifications that hold to a closer range in Brinell numbers.

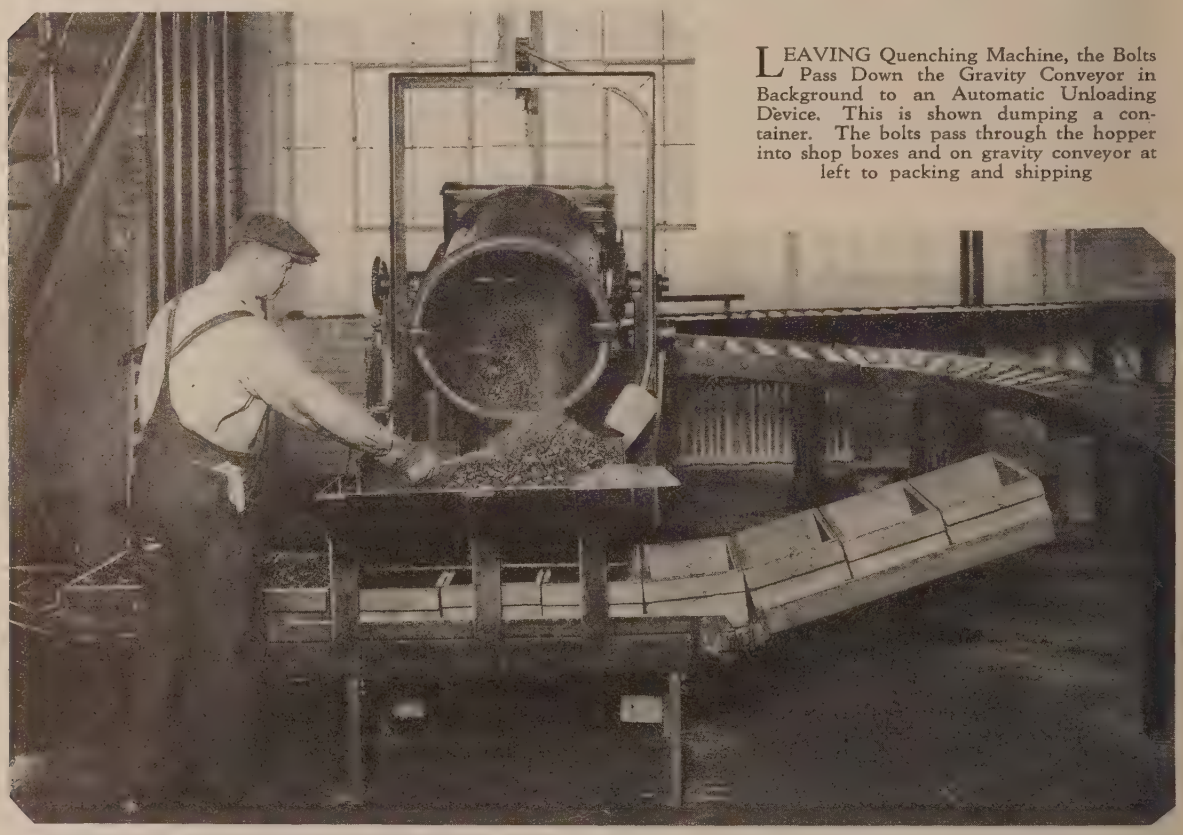
Some consumers are interested mostly in tensile strength, others in Brinell hardness, wanting it high or low, depending on their product, and still others in the elastic limit. Although tensile strength and hardness are the two physical properties given most importance by exacting buyers, some have strict requirements in respect to all three of these properties. Some also include specifications covering elongation and reduction in area. In addition, and perhaps no less important, is the demand for closer dimension limits. This necessitates avoidance of scale.

Gas Furnace for Hardening

Hardening, the first heat-treating operation, is done in the Lamson & Sessions plant in a gas-fired rotary furnace in the basement. The bolts are kept in the furnace from 60 to 90 min. at 1450 deg. to 1600 deg. Fahr., depending on the steel and the customer's requirements. This furnace is used also as a carburizing furnace for bolts which are to be case hardened and not subjected to any further heat-treating operation. An electric furnace of the continuous conveyor type, will be installed shortly in the heat-treating department, to supplement the gas-fired furnace for hardening high-carbon and alloy steels.

Bolts after heating for hardening are brought from the second floor to the heat-treating department in shop boxes on an automatic lift and dumped into containers on a roller conveyor that passes along the side of the furnaces. They are drawn in Homo furnaces, of which there are eight of 40 kw. capacity arranged in two parallel groups.

Space is provided for eight additional furnaces of this type. Another roller conveyor leading from the automatic lift will be placed parallel to and back of the one now passing in front of the first row of furnaces. From this the boxes of work will be lifted over to the second conveyor, and dumped into the containers in which they are charged into the furnaces.



LEAVING Quenching Machine, the Bolts Pass Down the Gravity Conveyor in Background to an Automatic Unloading Device. This is shown dumping a container. The bolts pass through the hopper into shop boxes and on gravity conveyor at left to packing and shipping

Each row of furnaces is served by a crane with 16-ft. span and carrying an electric hoist. The crane has electric drive for both movement of the hoist along the span and movement of the bridge along the crane runway. Current for the longitudinal movement is supplied by three rails suspended from the ceiling. The containers, circular buckets 24 in. in diameter and 30 in. deep, have a capacity of 800 lb., which is the usual furnace load.

The drawing furnace temperature ranges from 1100 to 1200 deg. Fahr. and the work is kept in the furnace from 45 to 75 min., depending on the grade of steel and the physical properties required. From the drawing furnace the hoist carries the container to the quenching machine. This consists of a tank 4 ft. x 8 ft x 4 ft. deep, with automatic mechanism with push button control for handling the container in and out of the tank. The

quenching solution is soda water and a small percentage of soluble oil.

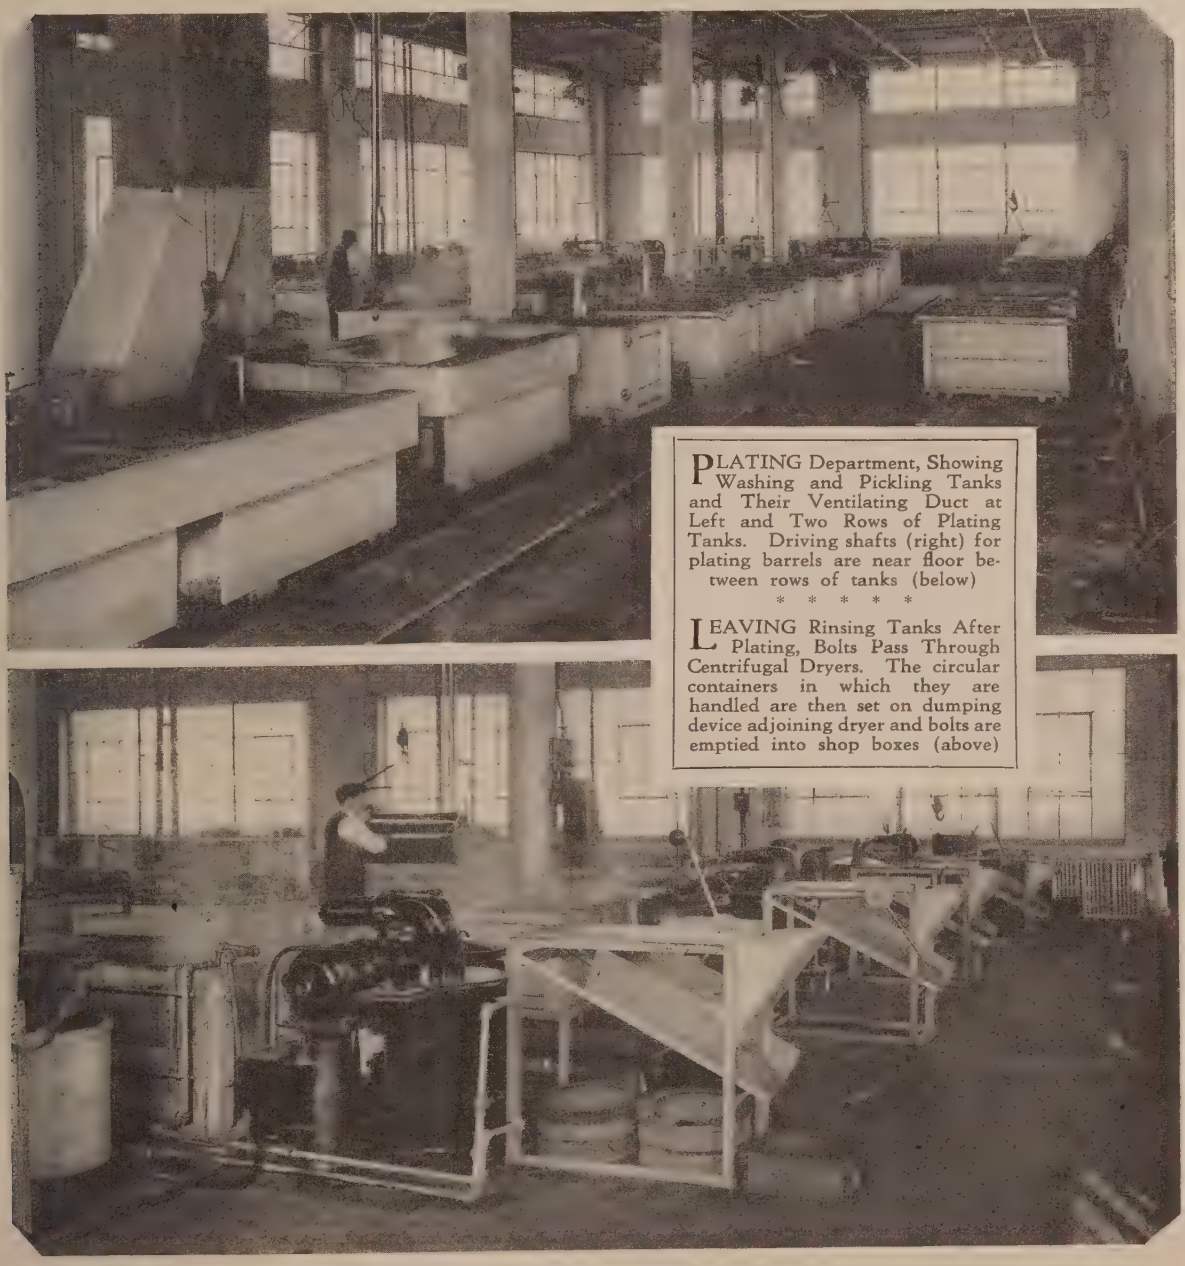
Quenching by Automatic Lowering Device

Lowering the container into the quenching tank is controlled by a variable-speed drive. When the bucket of work reaches the solution its speed is materially reduced; when it is lifted out the same speed is maintained until the container is out of the solution, the speed then being about doubled. Because of the slow dipping in the quenching solution instead of rapid immersion, the liquid slowly seeps through the work, not causing a large amount of steam and insuring a uniform quenching. The quenching solution is heated in the morning to a minimum of about 130 deg. Fahr., by means of steam coils, and is kept normally at approximately 180 deg., although the heat from the work sometimes brings it up to the boiling point.

The function of the soluble oil is to give color to the product. The temperature of the work is high enough to carbonize the oil and the work comes out with an attractive black coating, which will prevent oxidation for some time. The supply of oil is replenished occasionally by dumping a bucket of fresh oil into the quenching tank. The cycle for immersing the work in the solution, quenching and raising it from the tank takes 5 min.

As the bolts are handled in large quantities, there is little surface exposure to the air during the short time required for moving them from the drawing furnaces to the quenching machine. Thus formation of scale is avoided and there is assurance that the pitch diameter will not be changed. The heat-treating methods followed, it is stated, result in a product uniform in tensile strength and in hardness. A cup fracture is produced on tensile testing and the structure has a silky appearance. The bolts are held within the National Screw Thread Commission's tolerances for class 2 and 3 fits. The pitch diameter is held within 0.002 and 0.003 in.

On being lifted from the quench the container remains above the tank about 5 min., or until the next container



PLATING Department, Showing Washing and Pickling Tanks and Their Ventilating Duct at Left and Two Rows of Plating Tanks. Driving shafts (right) for plating barrels are near floor between rows of tanks (below)

* * * * *

LEAVING Rinsing Tanks After Plating, Bolts Pass Through Centrifugal Dryers. The circular containers in which they are handled are then set on dumping device adjoining dryer and bolts are emptied into shop boxes (above)

is brought to the tank, that time being sufficient for the work to drain. The container then moves on to a roller conveyor which carries it a short distance to an automatic unloading device, which dumps into a hopper. The empty container is switched on to another roller track which moves it back to a position in front of the furnaces for reloading.

From the hopper the bolts pass to a gravity roller conveyor which carries them 350 ft. through an inclosed runway over the roof of an adjoining building. This conveyor connects to a spiral conveyor which carries the boxes of bolts down to the packing and shipping department.

A second quenching tank is provided for quenching in water those bolts which are to be plated. The overhead hoist delivers the containers of work to this tank. After quenching, the containers are placed on a roller conveyor that leads into the plating department.

Efficiency in handling the work is being increased by the use of work containers handled with tongs. These are suspended from the hoist. When the latter is raised the tongs grip over a lug that extends around the top of the container. When the tongs are lowered they release hold on the container. With the use of the tongs containers with eyes and a handling device with hooks, requiring hand labor in hooking and unhooking, will be eliminated. For drawing and quenching small lots the company has devised circular sheet metal boxes holding 150 lb., five of these nesting in one of the standard containers.

Control equipment for the drawing furnaces is located in a glass-inclosed mezzanine room overlooking the furnaces. Each furnace has independent heat and production control from instrument boards designed by the company. Red signal lights and a bell are used to signal the operator when the furnace is turned off.

Three Men—9600 Lb. an Hour

With the eight furnaces a bucket holding 800 lb. of bolts is heat-treated every 5 min. or at the rate of 9600 lb. an hour. However, with the efficient handling and other facilities only three persons are required to operate the department—a furnace operator, a helper and a man in the instrument room.

Freedom from smoke and fumes and the clean appearance of the room are conspicuous features of the heat-treating department. The cleanliness is due to the unusual attention that has been given to ventilation. The furnaces are set through the floor, the bottoms being a little below the ceiling of the floor below and the tops at a convenient working height for the furnace operator. The furnaces themselves are equipped with a ventilating system for carrying away the fumes.

An air outlet is provided by a 2 x 7-in. duct connected to the top of each furnace and extending down the outside to an 8-in. diameter duct that extends along the third floor ceiling beneath. One such duct serves each battery of four furnaces and the air through the two ducts is drawn out by one fan and exhausted at the side of the building. Air to replace that drawn out is admitted into the top of the furnace, where an aluminum slip ring fits loosely around the furnace cover and provides an air inlet.

One feature of the furnaces that does not have to do with ventilation is the elimination of the usual cylindrical screen in the center of the containers. The air placed in circulation by the fan in the bottom of the furnace is forced through the work, instead of through the cylindrical screen. This is proving a satisfactory method of air circulation and at the same time the capacity of the container is increased.

Both quenching tanks are entirely inclosed with sheet metal hoods and the smoke and steam arising during quenching are exhausted through ducts, being drawn out by suction fans on the roof. The room is ventilated by four exhaust ventilators extending from the ceiling and connected to a fan on the roof. The room is heated by unit heaters; when the windows are closed these supply air to replace that exhausted by the various ventilating units.

Face brick is used for the interior mason work because, with its tile finish, it is easy to clean. The walls are finished in a light tan color which, with the brick trimming, gives the room a bright and neat appearance.

Flexibility Features Plating Facilities

NOT only is the plating department equipped for plating with cadmium, brass, nickel, lead and copper, including plain copper coatings and bronzes, but also for Parkerizing and galvanizing. Chromium plating will be added. The electrolytic process is used for all kinds of plating. In lead plating the company has found that the coating applied electrically is not so porous as when hot dipped and consequently is more satisfactory. Four double-wheel buffing and polishing machines make it possible to meet any polishing specification.

The convenient arrangement of the equipment and the location of the plating barrel driving mechanism are among the interesting features of the plating department. Work starts at the end of the plant adjoining the heat-treating department and is finished at the other end. A floor-type gravity conveyor will be installed shortly for carrying work through the department. This will deliver boxes of finished bolts to an automatic lift, which will discharge them to a gravity conveyor, which will in turn carry them to the packing and shipping department.

The plating tanks are of the double-barreled type arranged lengthwise of the plant in five lines, two for cadmium plating, one for galvanizing, one for special finishes (copper, brass, nickel and lead) and one for Parkerizing. There are 16 tanks and 32 plating barrels. In addition, a sixth line contains large tanks for the still galvanizing, and nickel, copper and cadmium plating of work too long to be handled in the plating barrels.

Shaft Lines Along Floor

Driving shafts for the plating barrels, usually placed overhead, are here located a few inches above the floor. One shaft along the wall drives the barrels in the first line of tanks and the other four lines are driven by two shafts, each located between rows of tanks and driving the barrels in two adjoining lines. There are two washing and pickling tanks, one of each at the head of one line, and these serve the adjoining line in the same bay, a crane with a short runway being provided to deliver work for the second line.

From the end of the crane runway, monorail tracks equipped with electric hoists extend over the tanks the length of the building for handling work in and out of the barrels. Fumes from the pickling and washing tanks are drawn through ducts around the sides at the top of the tank and carried outside the building through a vertical duct leading to the roof, where they are exhausted by a suction fan.

Two rinsing tanks, one for cold water and one for hot water, are located at the end of the line of plating tanks. After rinsing, the bolts are placed in centrifugal driers, one of which is located at the end of each plating line. Here they are dried by a blast of hot air.

Adjoining each drier is an efficient dumping device designed by the company. The circular container that holds the work during drying is placed in a holding fixture on the dumping mechanism and is turned over by a hand-operated spider, bolts being dumped into a chute, from which they pass into shop boxes. Then they are ready to go to the packing and shipping department.

Molybdenum in Cast Iron

Strength and Hardness Increased Much More Rapidly Than Machinability Decreased—Best Results Achieved With 1.5 Per Cent Molybdenum

BY E. K. SMITH AND H. C. AUFDERHAAR*

As usual, steel has led the iron industry in the use of alloys, but recently they have been successfully introduced into gray iron foundries—particularly the use of nickel and nickel with chromium. Other alloys have been tried with varying results, but as yet have not been accorded wide use. One of the most promising of these, molybdenum, has received comparatively little attention in the past, despite its availability from many mines within the United States.

Gillett and Mack, in their recent book "Molybdenum, Cerium, and Related Alloy Steels," state that four alloys are most used in steel making, these being nickel, chromium, vanadium, and manganese; and that the most of these alloys are imported. "The development of a domestic alloying element which can, in whole or in part, replace or supplement these foreign elements, is of obvious importance to American steel makers and users. Molybdenum is such an element. The United States has the largest potential supply of molybdenum ores of any country in the world." Any large metallic deposit is a national asset and this is particularly true of molybdenum. There are a number of deposits, mostly in the Western States. The present price of about one dollar per pound of contained molybdenum restricts the use of this material but it seems very probable that the price can be reduced when molybdenum is used in larger tonnages. Molybdenum has earned a definite and increasingly important place in steel making, and may have an even more essential part in the development of high-test gray irons, especially in case a national emergency should make it difficult to obtain other alloys.

Little Information Now Available

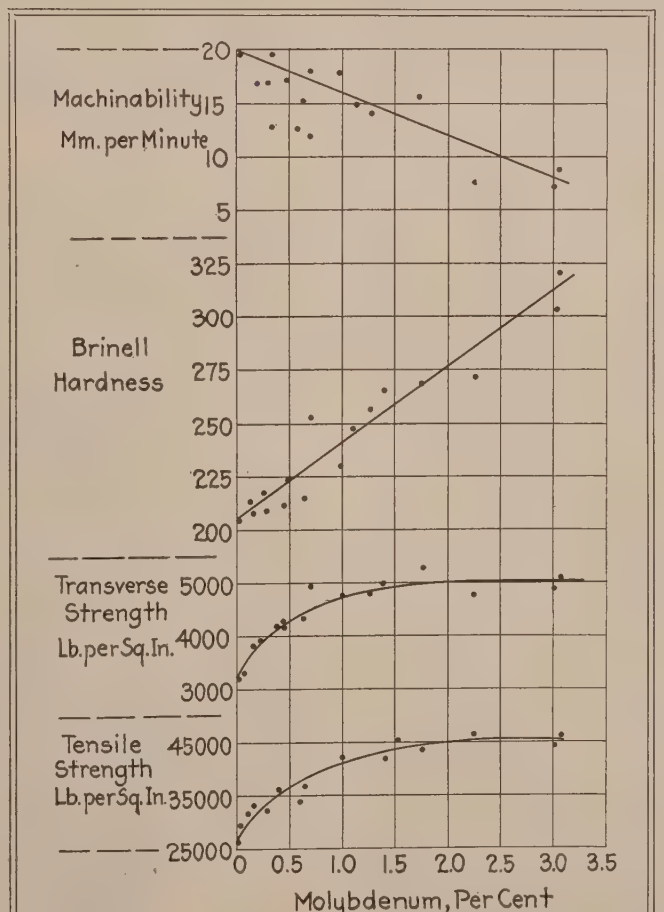
Surprisingly little has been published on the subject of molybdenum in cast iron, although there are numerous articles on molybdenum in steel. In 1920, G. W. Sargent reported improved tensile strength and toughness imparted to gray iron by molybdenum. (a) In 1923, O. Smalley presented data before the Institute of British Foundrymen on special cast iron. (b) He found that molybdenum is valuable as a strengthener, toughener and grain refiner and that up to 0.50 per cent, machinability is not affected. He noted one of the most striking characteristics of molybdenized gray iron, i.e. its strong tendency toward putting graphite into the nodular form.

Piwowarsky, in his notable article on alloys in gray iron, (c) finds increased strength due to molybdenum.

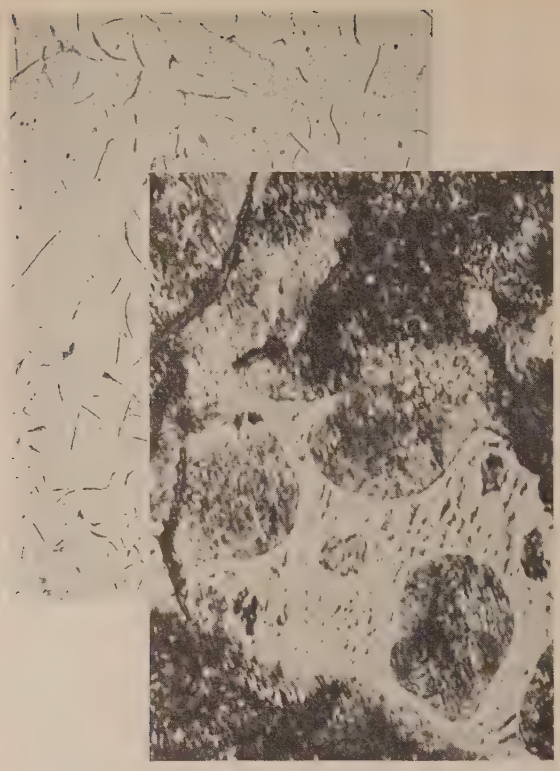
Recently there has been considerable work on molybdenum in cast iron but as yet little has been published.

Data on Crucible Melts

In planning this series of experiments it was desired to follow practical foundry conditions as closely as possible. Preliminary work demonstrated that it was difficult to effect complete solution of high percentages of molybdenum when such additions were made to the ladle. There was also to be considered the small but unavoidable fluctuations in



FORTY Crucible Melts of Cast Iron of Uniform Composition, Except for Molybdenum Content, Were Tested by Standard Methods, and the Most Important Data Is Plotted Above



STANDARD Cast Iron Containing No Molybdenum. Unetched Micro at 100 Diameters Shows Fine Graphite in Flakes. Etched micro at 500 diameters shows comparatively coarse grains, with graphite, pearlite and phosphide

composition of iron produced by the cupola on a commercial scale. Therefore all charges were melted in crucibles, by which means the usual fluctuations in chemical constituents could be rendered negligible. As a check on the results, molybdenum was added in the ladle, especially in the lower ranges, these results being comparable to those obtained by the crucible melting.

In order to have uniform composition, identical charges were made up for the whole series of crucible heats, forty in number, varying only in the size of molybdenum addition. Cast scrap (42 per cent of each charge) was obtained from one large casting of uniform dimensions, while pig iron (50 per cent) and steel (8 per cent) were from carloads of unusual constancy of composition. Molybdenum was used in two forms, ferromolybdenum and a lower melting point molybdenum alloy. (Calcium molybdate seemed unsuited for these experiments.)

Analysis of test bars was as follows, there being little variation:

	Per Cent
Silicon	2.18
Manganese	0.52
Sulphur	0.060
Phosphorus	0.37
Total Carbon	3.32
Graphitic Carbon	2.67
Combined Carbon	0.65
Molybdenum	According to addition

Gas was used as a fuel, crucibles being carefully covered.

Tension tests were made on bars cast in accordance with the recently recommended pattern for gray iron for pipe flanges and fittings. Transverse tests were run on American Society for Testing Materials arbitration bar. Brinell hardness was determined on the lower end of the arbitration bar.

Machinability Determined by Drilling

In arriving at comparative values for machinability, we used a modified Keep test, it having been found to give satisfactory results in the past. Equipment consisted of a direct-connected, motor-driven drill press travelling at 400 r.p.m. Suitable weights were placed on the press (which was free to move vertically) so that the total weight at the point of the drill was 130 lb. A ⅝-in. high-speed drill was used, care being taken that sharpening between experiments was uniform.

In order to test for machinability, the end of a transverse bar was ground to a depth of ⅛ in. and the drill point rested on the bar, the exact point being located by a center punch. The drill was then operated for one minute, and the depth of the hole measured. Machinability was reported in penetration — millimeters per minute. Duplicate determinations checked closely.

The authors realize that no one test can measure all kinds of machinability, but believe that the drill test gives good average results.

Physical Properties and Structure

Results are summarized on the graph showing the physical properties determined and by the micrographs showing the structure. Owing to the method of melting the variations, which are reasonably consistent, may be ascribed primarily to the influence of molybdenum.

Machinability.—Increasing percentages of molybdenum decrease machinability, as measured by the drill press. However, machining did not become notably difficult, until molybdenum had reached 1.5 per cent, which point also marked the attainment of maximum strength. At 3 per cent molybdenum, drilling was difficult. A bar, not shown in graph, with 4.40 per cent molybdenum, could not be drilled.

Brinell Hardness.—Molybdenum hardens cast iron, even in small amounts, but apparently hardness increases more rapidly than machinability decreases. At maximum strength, with 1.5 per cent alloying metal, the Brinell

STANDARD Cast Iron Containing 0.65 Per Cent Molybdenum. Unetched micro at 100 diameters shows large nodular graphite. Etched micro at 500 diameters shows a somewhat finer grain than the iron without molybdenum. Constituents are phosphide, graphite and pearlite

number was about 260, but the bar could be readily drilled. A bar with 4.40 per cent molybdenum showed 418 Brinell, and could not be drilled.

Transverse Strength.—Starting with unalloyed bars having transverse strength of 3200 lb. per sq. in., strength increased rapidly, reaching a maximum of 5000 lb. per sq. in. with 1.5 per cent alloy.

Tensile Strength.—Results on tensile bars plotted in a similar curve to that for transverse strength, a maximum of 45,000 lb. per sq. in. being found with 1.5 per cent molybdenum.

The micrographs, both etched and unetched, explain the effect of molybdenum on the physical properties of cast iron. In the first place, the usual long, heavy plates of graphite are absent, and most of the carbon is in the from of nodules. This naturally strengthens the iron. Very fine pearlite or sorbito-pearlite, induced by the alloy, also tends towards strength.

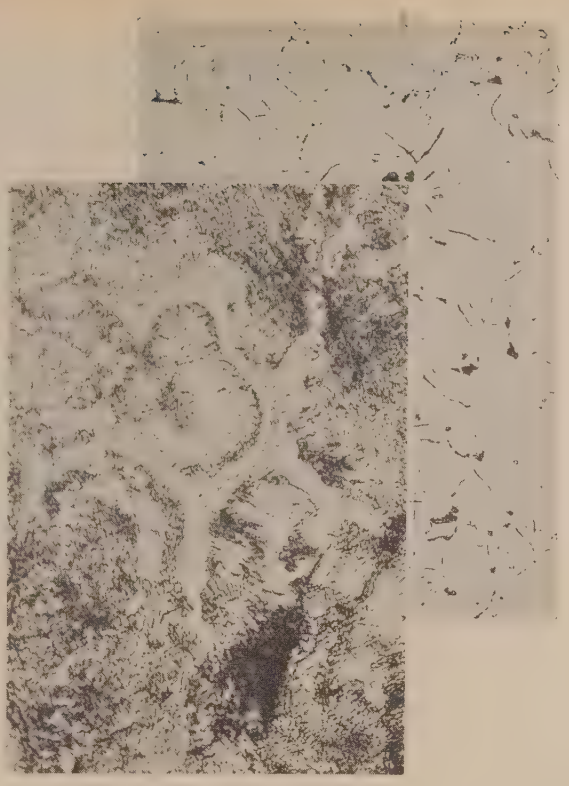
The fact that the molybdenum to a great extent is in solid solution in the ferrite toughens the matrix, promotes shock-resistance, and also inhibits grain growth.

Both the solid solution and the sorbitic structure harden the cast iron, as shown by Brinell tests, and in the higher ranges of molybdenum, make the castings less machinable.

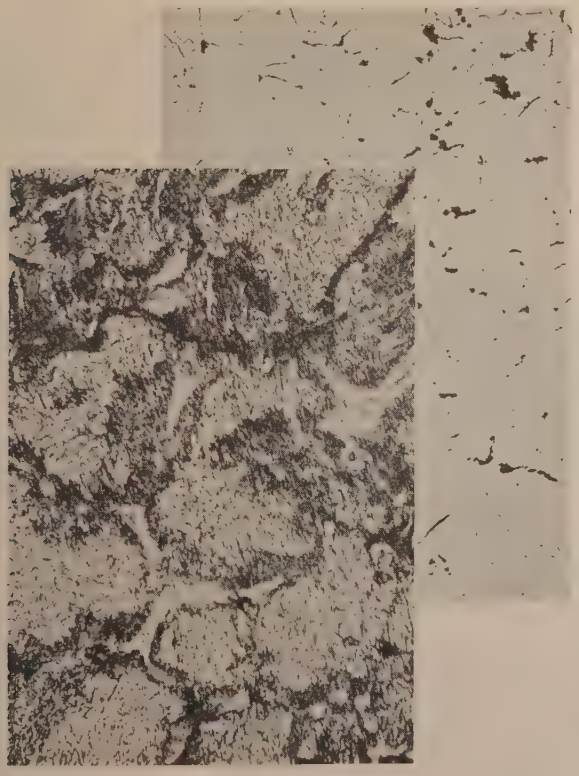
Increasing hardness of the iron is not due to increase in carbides, as there is little increase in combined carbon shown by analysis, and by microstructure. This absence of excess carbide, coupled with the strengthened matrix, also helps to account for the high resistance to shock.

Practical Conclusions

Molybdenum is far from being a remedy for all foundry troubles, but as a strengthener it has a definite use, especially where low costs are not of primary importance. With molybdenum at one dollar a contained pound, two per cent added to cast iron would add about $40 per ton to the cost, the tensile strength being increased from 26,000 to 45,000 lb. per sq. in. An addition of one per cent will raise the strength from 26,000 to 40,000 lb. per sq. in., at a cost of $20 per ton. Obviously, the increased strength would permit lighter sections.



STANDARD Cast Iron Containing 1.77 Per Cent Molybdenum. Unetched micro at 100 diameters shows flake and nodular graphite. Etched micro at 500 diameters shows that increasing amounts of molybdenum progressively refine the grain. Structure comprises a small amount of graphite, very fine pearlite tending toward sorbite, and phosphide



STANDARD Cast Iron Containing 3.10 Per Cent Molybdenum. Almost all the graphite is in nodules; the grain size is small, and the pearlite tends strongly toward sorbite

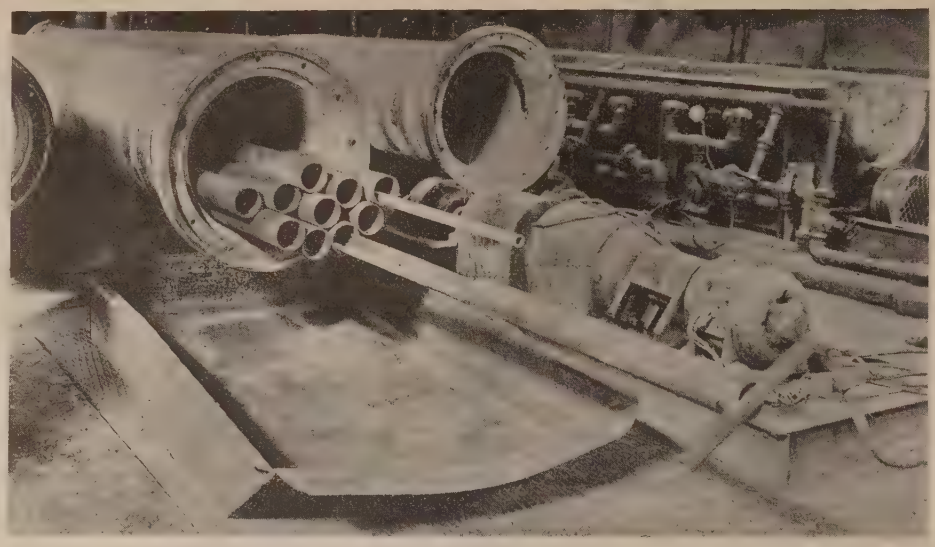
The statement has been made that molybdenum acts as a desulphurizer. The present experiments gave evidence of no such action, although at first the addition of alloy apparently reduced sulphur. This effect seemed to be due to an interference with the usual analytical methods.

A limited number of impact tests indicated that iron containing 1.77 per cent molybdenum had almost double the shock resistance of the unalloyed iron. It seems probable that this property of molybdenum bearing cast irons will prove of value.

Preliminary experiments also indicated that small percentages of molybdenum have little effect on the growth under repeated heatings, or on scaling.

Maximum values for transverse strength at 5000 lb. per sq. in., and for tensile strength at 45,000 lb. per sq. in. were found, but it is obvious that these values hold only for the type of cast iron used. By changing the other elements such as carbon and silicon, higher strengths could undoubtedly be obtained.

In summary, the results of our experiments show that moderate amounts of molybdenum have a beneficial effect on the physical properties of cast iron, but the increased cost is a detriment. However, where decreased weight, increased strength, or shock resistance are important, molybdenum can be used to decided advantage.



SEAMLESS Tubes are Loaded Into Retort. Calorizing compound is then placed uniformly inside each tube by means of the split pipe, and a small diameter pipe placed in each tube to prevent the charge from moving endwise and leaving some portions bare. Compound is also placed in channels between tubes

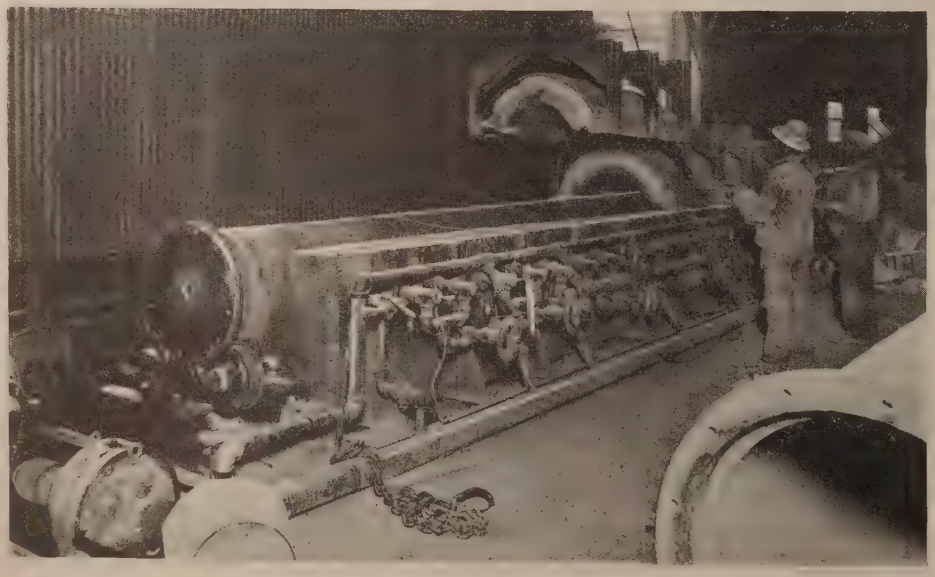
Calorizing Tubes to Resist Corrosion

Rotating Retort Contains Steel Tubes, Granular Aluminum and Hydrogen Atmosphere—Alloy Forms on Surface Which Resists Oxygen and Sulphur

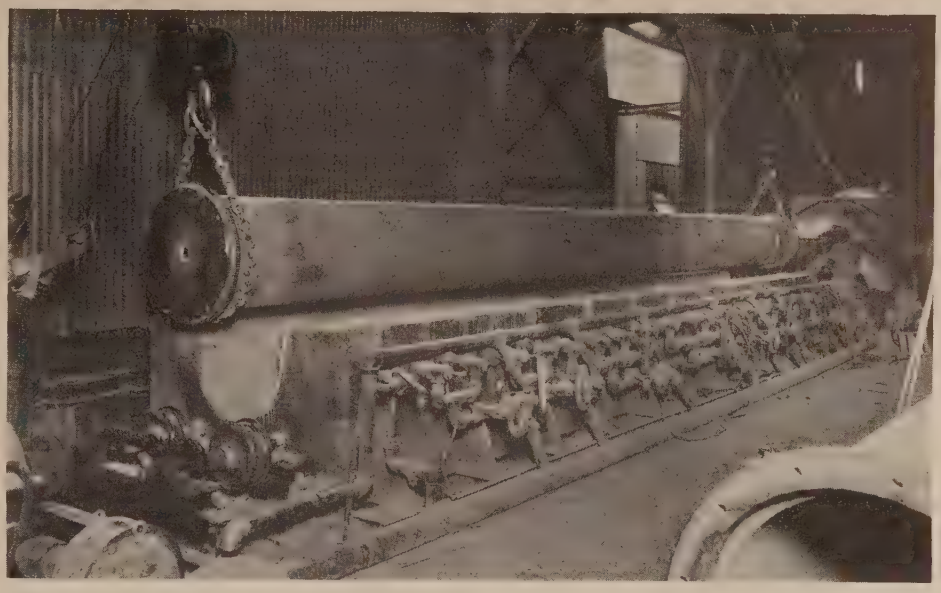
BY B. J. SAYLES*

CALORIZING, as is well known, is a process whereby aluminum is driven into the surface of another metal, usually mild steel, to form an aluminum alloy. This alloy, where mild steel is the base metal, is practically immune to oxidation up to maximum temperatures of 1650 deg. Fahr., and entirely resistant to the corrosive attack of gaseous sulphur products. The process has thus extended the use of an inexpensive construction material to operations in which it could not previously be successfully employed.

*President, Calorizing Co., Wilkinsburg, Pa.



FURNACE Top Consists of Series of Bungs. After assembling, joints are patched, and uniform temperature given to work by series of gas burners. Heat and reducing atmosphere closely controlled at all times



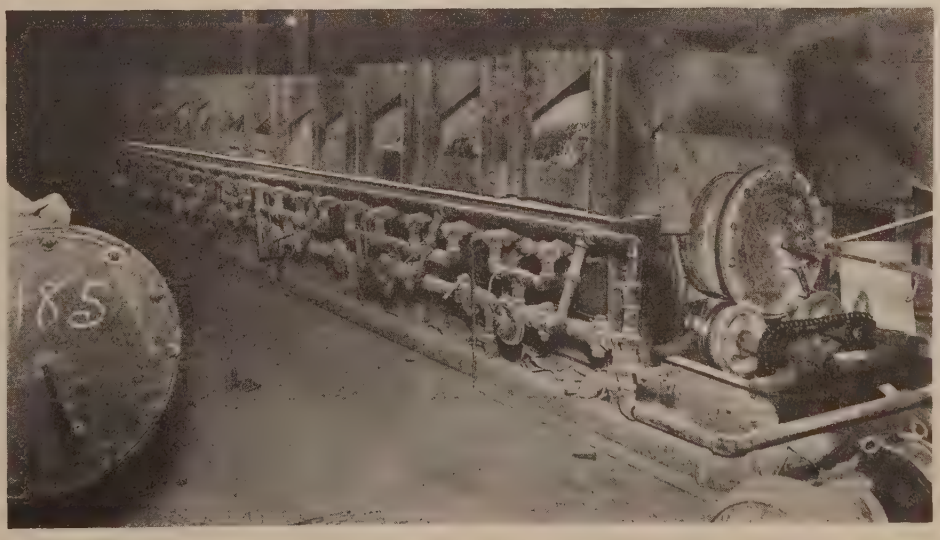
LOADED Retort Has Ends Tightly Bolted On, and Is Lowered Into Furnace Casing. End flanges engage rollers, one pair driven, another pair idling, and retort turns slowly while under heat

One of the major applications of calorizing is for processing seamless steel tubes for oil stills. Even when such equipment is designed to operate on petroleum products at comparatively mild temperatures—say 750 deg. Fahr.—the reactions going on in the fluid cause the deposition of more or less petroleum coke. This prevents the normal heat flow from the furnace gases to the petroleum, the same as boiler scale cuts down the efficiency of a steam boiler. A more serious consideration is that the temperature of the outside of the tubes rises, gradually approaching the temperature of the products of combustion, to a degree where bare iron or steel scales rapidly.

Another factor which weakens oil still equipment is internal corrosion by sulphur-bearing compounds. In combating this latter difficulty two methods have been in vogue. The equipment may be built extra heavy, providing sufficient metal thickness to withstand corrosion for an extended period, or the oil may be treated to neutralize its corrosive elements. Both of these expedients are costly and only partially effective. Sulphur corrosion is especially active at temperatures above 700 deg. Fahr., so that still tubes are invariably subjected to severe attack and rapid destruction.

When this combination of external oxidation and internal corrosion has substantially reduced the wall thickness of an ordinary steel or iron tube, it usually swells in diameter, there being insufficient steel to resist the internal pressure. Reduction of the wall to the danger point is therefore first evidenced by swelling, but there is no assurance that the swelling will be detected in time to permit replacement before rupture occurs.

From the foregoing it is apparent that calorizing serves a dual purpose on cracking-still tubes, rendering the interior immune to sulphur corrosion while the exterior is protected from oxidation. In calorizing the aluminum is driven into the surface layer of the steel forming an iron-



ATMOSPHERE of Hydrogen Maintained in Retort; Gas Enters Through Pipe at Center of End Plate. Calorizing requires 5 hr. at 1740 deg. Fahr. Entire cycle takes 11 hr.

aluminum alloy, an integral part of the steel, which resists both oxidation and corrosion. The alloy surface is much harder than mild steel and under the action of the tube cleaner assumes a high polish.

Cracking-still tubes to be calorized are preferably specified to be cold drawn under American Society of Mechanical Engineers Specifications, hot pickled after annealing at the mill to remove scale. The steel as delivered is also thoroughly sandblasted and wire brushed to provide a smooth, clean surface. The tubes are then placed in a cylindrical retort and packed in an aluminum compound which is uniformly distributed over both the interior and exterior surface of the steel. The illustration shows a pipe split down its center for introducing powdered compound into the tube, uniformly from end to end. The heads of the retorts are then bolted on and hermetically sealed, a hydrogen atmosphere being maintained during the entire subsequent process.

Calorizing retorts shown in the illustrations are 24½-in. outside diameter, 30 or 35 ft. long. Four furnaces are provided, approximately 35 ft. long by 5 ft. wide by 6 ft. high, designed and built by Surface Combustion Co. of Toledo, Ohio. The shell of the furnace is a cylindrical steel plate lined with 9 in. of fire brick.

Tops or bungs are removable in 3 ft. and 6 ft. sections. Tops are lined with 2½ in. of Sil-o-cel and 9 in. of fire brick, and are carried in a steel frame. The lower part of the furnace is also sectionalized and bound together by a structural steel frame.

A base carrying chilled iron rollers is located at either end of the casing; retorts rest on flanges bearing on these rollers. Rollers at one end are driven by a 5-hp. motor through speed reduction gears to permit rotation at speeds varying from 1 to 3 r.p.m. Rollers at the opposite end of the furnace are idlers.

Each furnace is fired with 23 Surface Combustion burners for natural gas located on one side. There are seven thermocouples protruding into each combustion chamber and these are connected with an indicating switchboard type pyrometer, so that the temperature at any point may be accurately checked at convenient intervals. Gas burners are manifolded to inspirators by which the proper gas-air mixture for complete combustion is maintained. Any furnace atmosphere may be had with this system, but in this application a neutral atmosphere is vital to minimize scaling of the retorts at the operating temperature of 1740 deg. Fahr.

It requires from 4 to 4½ hr. to bring the retort and furnace up to operating temperature; gas consumption for this and the 5-hr. soaking period is about 33,000 cu. ft. A charge in the 35-ft. retort will include 3750 lb. of steel, 3000 lb. of calorizing compound which, with the 11,000-lb. retort, makes a furnace charge of 17,750 lb. After shutting off the gas it takes 2 hr. for the retort to cool black.

German Version of Birth of Stainless Steel

BY DR. PHIL. H. SCHOTTKY*

IT was a peculiar coincidence that in 1912 the most useful of the non-rusting steels was just being baptized, while a noted authority on special steels was publishing in his handbook the following statement:

> The question of the rust-resistance of certain special steels has been insufficiently studied. Still, everything points to the fact that there is no alloy of iron which will withstand the attack of rust.

Many a scientific prediction is later contradicted, for to err is human, and science is of human origin. However, in this case, the contradiction followed close upon the heels of the prediction. Corrosion problems had been under investigation in the Krupp laboratories at Essen since 1909. Two men, of quite different nature, were joined in the common pursuit: Professor Strauss, physicist, hearty in spirit and tireless in his search for improvement, and his assistant, Dr. Maurer, metallurgist, slow, yet temperamental, profoundly absorbed in his scientific thoughts. He was fresh from Paris, where he recently completed an outstanding research under the great Osmond.

At the same time as, but independently of, the study of rust-resistance, Professor Strauss had begun investigations on heat-resisting alloys, which were to serve as protecting tubes for pyrometers. Two high-chromium and three high-nickel, high-chromium steels were prepared for this purpose. It was then noticed that a piece of the steel remained bright in the air of the laboratory for months, while nickel itself was quickly attacked. Such a fortunate discovery, bridging the gap between two independent investigations, was, of course, a tremendous spur, for here at hand was an alloy steel which behaved like a noble metal. Such was the ancient goal of the alchemists, who were wrecked by its impossibility. Rarely was it permitted them to find something useful along the way—although, according to tradition, Johann Friederich Vöttger discovered the process of making porcelain in the effort to produce gold.

People were more reasonable perhaps in the scientific nineteenth century. Still, from its beginnings, from the production of crucible steels by Alfred and Friedrich Krupp, the company had always been devoted to the building up from raw materials of finished and semi-finished products of every description. It lay, therefore, in the Krupp tradition to supply an alloy, containing 75 per cent of cheap, base metals, which had the enduring properties of a noble metal.

A similar steel had already been produced by the Frenchman, Guillet, who, however, was unable to forge it. This Krupp was able to do, and for this reason the Krupp building where the first crucible melts were made has come to be known as the source of the "noble" steels.

The goal of practical utility was still far from reached. The mechanical division, which was to prepare tensile specimens, returned the steels to Professor Strauss as unworkable. In fact, it resisted every effort to turn it down in a lathe and broke on bending, with a brittle crystalline fracture. Heat treatment seemed the only answer, but no information was available for selection of the proper procedure. This delayed the "birthday party" of V2A steel for several months.

The correct treatment was finally found through scientific knowledge of the special properties of this non-magnetic steel—by quenching from 1100 or 1200 deg. C., in oil or water, the metal was rendered tough and relatively easy to work. Physical tests showed favorable values for tensile strength, ductility and toughness, while corrosion tests showed it to be superior to any other ferrous alloy. A large, smooth-turned cylinder, which is today on exhibition at the Krupp laboratories, had hung in the open, half under water, for months, without showing a trace of rust or a dimming of the nickel-like surface.

The V2A steel, as a useful alloy, was thus born, as is evidenced by the German patent, and if the reader wonders at its strange and somewhat mysterious name, let him learn that V2 signifies "test steel (Versuchstahl) No. 2," and that A denotes its austenitic character.

*From an article in *Monatshefte*, published by the Krupp company, Essen, Germany.

Development of Upset Forgings

Saving of One-Fifth in Weight and Great Improvement in Output—Uniform Grain Conditions Give Higher Strength

BY WILLIAM E. CROCOMBE*

PRACTICALLY a new process of forging, known as upset forging, has been developed to such an extent during the past five years that present output approximates 350,000 tons yearly. This estimate covers only commercial and automotive forgings; other types of forgings such as rivets, bolts, nuts and miscellaneous railroad car forgings (hangers, knuckle pins, air brake pins and coupler yokes) make up a total far in excess of that mentioned. This method of forging has decreased the amount of steel actually consumed by producers about 70,000 tons—a really great saving. The estimate for all types of upset forgings shows a 20 per cent saving in weight compared with hammer, hydraulic, or other methods of forging.

The upset forging machine has been one of the most important factors in the tremendous increase of automobile production, and has been a vital factor in the decrease of cost. This has been brought about not only by the saving of material entering into the forging itself, but also by the great increase in production over other forging methods.

Much Greater Production Obtained

I remember producing steering worms for the old Mitchell car in 1912 on a 3500-lb. steam hammer at the rate of 250 in a 9-hr. day. This forging, produced in a rolling die, had approximately 10 to 12 deg. draft. Its weight of about 20 lb. did not include the tong end, which was later cut off the forging and thrown away.

*President, American Forge Co., Chicago.

Present methods produce the same type forging on a 4-in. upsetter at a rate of 1200 in a 9-hr. day, and the finished weight of the same forging is 14 lb.—a saving of 30 per cent in steel and an increase of 380 per cent in production. This same story applies in even greater measure to main drive gears and cluster gears. The increase in production on main drive gears averages over 700 per cent and on cluster gears from 500 to 600 per cent.

Upset Method Eliminates Tong Holds

Another great saving in the upset method of forging is the elimination of flash and tong holds. This is accounted for by the difference in die construction and design. Hammer dies are made in two parts—the top die and the bottom die—and it is necessary to have the proper amount of draft, or taper, to remove the forging from the dies. This draft varies from 3 to 12 deg., differing with the design of the forging.

By contrast, the new forging machine die opens in three parts: a moving die, a stationary die, and the heading tools. The operator places the stock in the stationary dies and steps on the treadle, bringing the moving die over in direct line and gripping the stock. The headers then come in and do the necessary upsetting or forging operation, then return to their original position, leaving the finished forging in the stationary die. Neither draft nor taper is required for the operator to release the forging. In recent years new developments in upset forgings include the production of irregular designs requiring a trimming operation to remove flash, and this operation is

Bars Are Cut to Exact Multiples of the Metal Needed for a Given Forging. A bar end is heated and forged. The forged end is removed by a hot saw and the cut end of the bar is then reheated preparatory to continued forging

generally finished in the same die and same heat, eliminating the need of a trimming press.

Piercing of holes, or displacing of metal, in upset forgings has been an important factor in the reduction of cost to the consumer. No doubt the piercing of holes by the upset forging method saves the consumer not only considerable money in raw material, but also the cost of removing additional metal by either lathe or drilling operations. On large holes, 1½ in. in diameter and larger, material should be displaced, or pierced, but with enough tolerance allowed the forging manufacturer so that his production will not be impaired.

It should be remembered that in the piercing of upset forging smaller size stock must be used, increasing the number of passes, or operations, necessary to complete the forging. On the larger size holes the body of the punch is heavy enough to withstand the heat in the constant production of forgings, and the holes are fairly uniform. We have never been able, however, to maintain a perfect hole. By this we mean that constant production day after day will show some variation, 1/32 in. off to one side, then to the other.

It was our thought that improper heating caused this variation, thinking the punch would follow along the lines of least resistance, and in case a bar was not heated perfectly the punch would run to the hottest side of the forging. In a test, however, of a brand new machine (with new dies) and the bars all heated in an electric furnace, we still found a variation, amounting to 1/32 in. maximum. But it should be remembered that everything was new and in perfect condition. With older dies and equipment we have found our average variation from concentricity to be 1/32 to 1/16 in. This variance, with proper allowance for finish on the outside diameter, does not interfere with high-speed finishing production, and the saving in material and drilling time is highly desirable.

Design Shows Whether to Pierce

On small holes, 1½ in. and under, the design of the forging has much to do with the advisability of piercing. On a straight forging, with a perfectly plain outside diameter, we have gone to a 1-in. hole with no difficulty. But on certain types of gears, cluster gears for example, with three gears on one forging, we find it impossible to produce these parts economically with holes. These forgings, which vary in length from 5 to 8 in., generally have a finished hole either 1 in. or 1⅛ in. in diameter.

We found on this class of work that our die expense was increased 300 per cent and our production decreased to one-fifth. The increased die cost was caused by more passes and high-cost material for punches. Decreased production was brought about by the absolute necessity for perfect holes, and in case one punch bent or broke, the holes were off center, requiring a new set-up.

We discovered, after working this problem out with our customer, that we were trying to eliminate a drilling operation on these gears where the saving in material amounted to slightly over a pound, and one man on a multiple-spindle drill could drill and broach in one day more than our entire daily production of solid forgings. We were trying to compete, on equipment valued at considerably more than $50,000, including a forging machine, furnaces, motors, with a crew of four men, against a multiple drill and one man. Covering a period of two months, our average running production time on these gears pierced was 18 per cent, 82 per cent of the time we were down for machinery adjustments. Rejected forgings totaled 31 per cent. On the same gear made solid our production time was 94 per cent and rejected forgings 1.2 per cent.

While practically all metallurgical engineers insist on upset forgings in gear work, not only for additional strength on account of uniform grain flow, but on account of increased density that eliminates warpage or distortion in heat treating, the layman sometimes is at a loss to understand the changes which have been brought about in this method of forging. The increased strength in upset forgings was brought home forcibly in our organization last year.

We had a job that called for delivery of 7000 pieces a day—a very intricate job, which had six prongs running into the header about 1½ in. in depth. We tried every known die steel, and our average life on these dies amounted to 1200 to 1500 forgings. Four headers on one machine were split in one day and immediate action on our part was required to keep up production schedules. These headers were 8½ in. in diameter and were made of hammer-forged alloy steel.

A set of dies was designed to produce the same header forging from a 4½-in. round. It required 28 in. of this size stock to produce the headers, and to our great surprise the first one of these upset headers produced 26,000 forgings, and the largest run on the upset headers amounted to 37,000 forgings, from exactly the same quality steel as furnished in the hammered forgings.

From our experience in making and quoting on thousands of different designs of upset forgings, we believe the consumer would save not only on upset work, but on hammer work as well, if he called on competent forging experts to go over new designs, with the idea in mind of simplifying die construction and increasing actual production. On cluster gear production, the addition of ¼ in. in spacing between gears results in increased production of 30 to 40 per cent, with a corresponding decrease in die expense on forgings of this type.

On certain types of gears with a 1-in. finished space between gears, the forging must be finished 13/16 in. at that point to have necessary stock for finishing. This means that an insert as large as 8 in. in diameter must take the entire thrust in finishing the forging. Rapid production on gears of this type heats these inserts in spite of all methods of cooling, causing them to bend, making it necessary to stop production and so tying up expensive machinery to change the die equipment.

The addition of only ¼ in. in the spacing between gears allows a much stronger die to be designed, resulting in increased die life and increased production, all of which reflects back to the customer in lower prices.

After parts have been released for production, small changes are often impossible to make on account of adjacent component castings and gears, all of which must be redesigned to agree with the change on one gear.

Another factor in designing that causes considerable grief to all forging concerns is the use of very thin sections. We have found in our practice that, on forgings requiring a thickness of less than ⅜ in., it is necessary to set our headers flush with the dies, letting the spring of the bed casting produce the desired thickness. This method, of course, is dangerous. Production of forgings having a flange in excess of 5 in. in diameter and under ⅜ in. in thickness we believe to be impractical on upsetting machines, due to the tremendous strain put on the bed casting and crankshafts.

How the Large Demand Grew

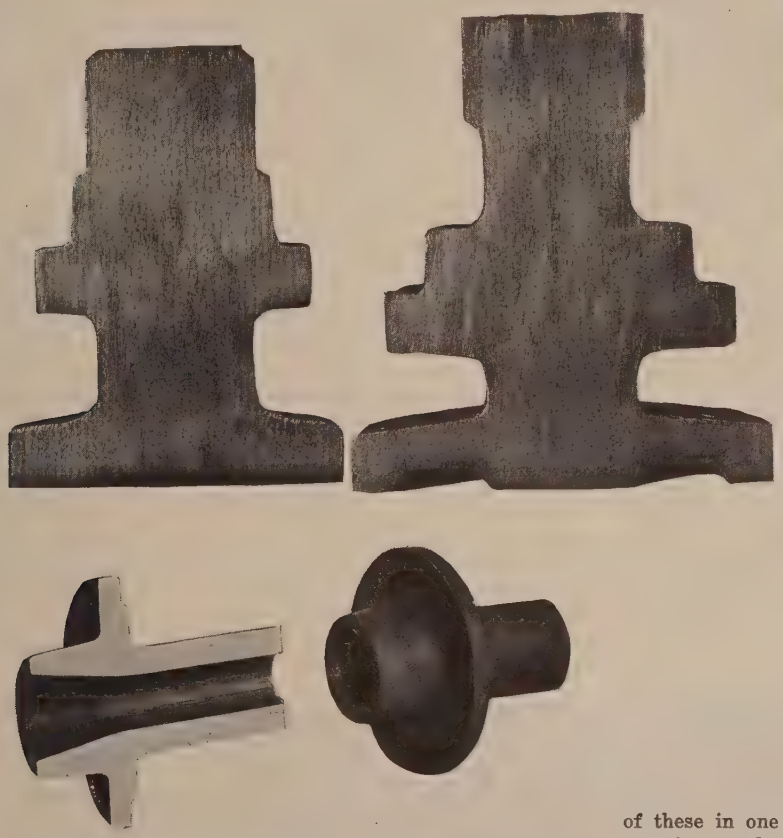
The first real demand for drop forgings came from the bicycle industry, and after the advent of the automotive industry the demand for forgings became so great that forge plants were unable to meet it. This led the larger automobile companies to install their own forging equipment as an insurance against delays in deliveries on their specifications. Thence came excess capacity, and after several periods of depression the World War created such a demand for forgings that perhaps no one industry in the entire country expanded so rapidly. The post-war period in the forging industry left a trail of bankruptcy, and

probably no line of business suffered so heavily from ruthless price cutting and keen competition.

As in all trade conditions of this kind, after a period of four years of practically no profits, the remaining forging concerns looked forward to better times, as hundreds of hammers and other forging equipment were forced out of the market. Bargain prices on this second-hand equipment led some buyers of our products to believe that forgings could be made cheaper in their own plants. Hence much of this old and obsolete equipment was sold and set up in competition with modern equipment, up-to-date plants and first-class forging organizations.

Plea for Adequate Cost Analysis

I have never been able to understand the installation of forging equipment in plants not consuming tonnage enough to warrant the organization necessary to produce forging on a competitive basis. Not enough time or study is put into the proposition until after the equipment is installed, and then eyes are closed to the constant loss of money. Charges that should be made direct against the forging department are made against general overhead, and no proper basis of outside competition can be arrived at.



This Upset Forging Was Made from a 3-in. Bar. The pierced hole is 1½ in. in diameter. The rim of the flange is ⅝ in. thick and the diameter of the flange is 7⅛ in.

Some producers would get quite a shock, I am sure, if the total of steel cost, actual labor, die expense, fuel cost, repair expense and power were prorated over the forgings actually produced, and then compared with competitive figures obtained from modern forging plants.

In our business the steel cost alone on certain types of forgings often runs from 65 to 70 per cent of the selling price, leaving so small a fabricating margin that only high and constant production with high-speed and efficient organizations, not only in the forge shop, but the die department as well, can show a profit.

One of our associated companies has had an experience of this kind in connection with the production of bolts and rivets. All told, we probably produce in our eight plants throughout the country 60,000 tons of miscellaneous hammer and upset forgings yearly, and we all thought we were pretty well up on all types of forgings. We discovered we had seven different bolt and rivet machines in various sections. The thought occurred to group all of these in one section and produce all forgings of this type in one plant.

ETCHED Cross-Section of an Upset Gear Forging (Above). Note that the grain is parallel to the axis of the bar and also parallel to the rim of the gear blank at the point where the teeth are to be cut

* * *

PERFECTLY Designed Cluster Gear Forging (Extreme Left) for High-Speed Forging Production, Long Die Life, High Production and Fast Machining. At its right is an incorrectly designed cluster gear forging Note the narrow spacing at neck of forging, resulting in shorter die life, lower production and slower machining

Upon impartial investigation we discovered that, even upon grouping these units, our cost on this particular product was much higher than the price for which the same commodity could be purchased in the outside market. This discovery resulted in shutting down all the rivet and bolt machines in our plants, saving the company thousands of dollars yearly.

Abandoning One Type of Product

Our investigation of this proposed change brought out the interesting fact that, in connection with the installation of all of these units under one roof, with the necessary buildings, new foundations, die equipment, heat-treating equipment, shear equipment, oil storage, steel storage, steel handling equipment and furnaces, the interest on our investment, not including machines, amounted to over $12,000 annually, and this figure alone can certainly purchase a great quantity of bolts and rivets. The same is true of other types of forgings and castings.

Conveyors and Ovens for Large Cores

Both Continuous and Batch Units in Same Plant Make Comparison Easy— Handling Costs Reduced

BY J. B. NEALEY*

PRINCIPAL operations in the manufacture of radiators and boilers are making and baking cores, and molding and casting. The foundry at the Bond plant of the American Radiator Co. at Buffalo uses mass production based on straight-line mechanical methods. Molding, pouring and shakeout all center around continuous closed-loop roller conveyors. All materials to and from these units are handled on roller conveyors, also.

The core-making section has been equipped with conveyors, ovens and machines, arranged so as to synchronize the two operations of making and baking. This establishes a definite time schedule in this department and permits very close control.

Four of the core ovens are continuous and automatic in operation and two of them are identical in construction and dimensions. Each oven is served by two jolt, rollover core-making machines, located side by side and in front of the oven. Cores made up on plates are transferred directly from one machine on to oven trays on the charging table. Cores and plates from the other machine are transferred directly on to a second charging table, from which they are lifted and set down on top of the cores and plates from the first machine, the top plate being supported above the lower by four cast iron pegs. These are then loaded on to the shelves of the oven conveyor.

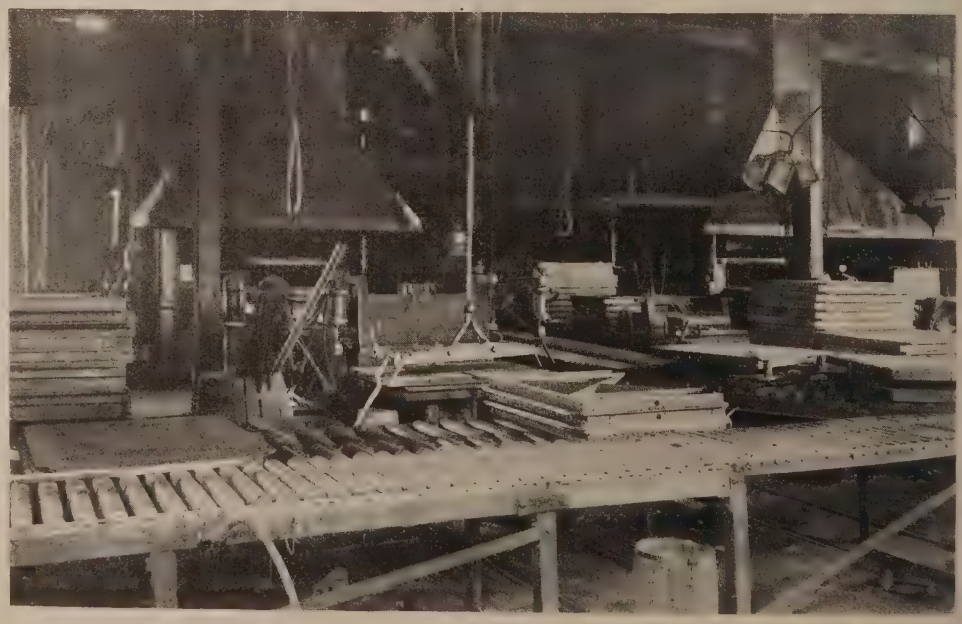
Built of steel, its walls filled with 4 in. of insulation, the oven is 74 ft. 6 in. long, 7 ft. 8 in. wide and 19 ft. high. The motor-driven conveyor consists of two endless chains supporting a series of shelves carried through the oven, returning at the top, with discharge at the charging end. There are 279 ft. of link chain weighing 13 lb. to the foot and supporting 62 carriers or shelves. Each shelf weighs about 96 lb., and hangs down 12 in.

*American Gas Association, 420 Lexington Avenue, New York.

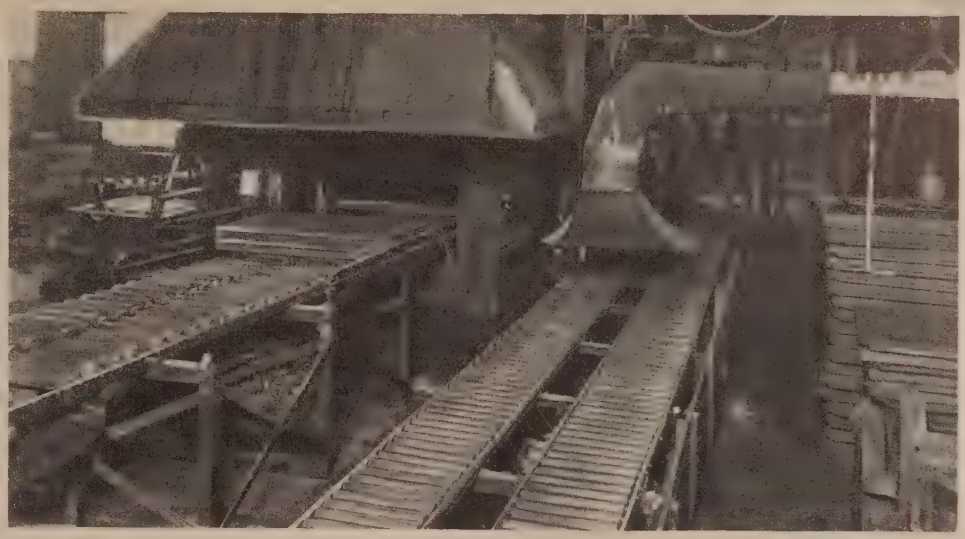
Two Unequal Burners Used

Heating is with gas and in the following manner: Two ducts for distributing combustion and recirculated products are installed in the bottom and run lengthwise of the oven. Ports in these ducts are so spaced as to distribute the heat evenly throughout the length of the oven. In one end of each distributing duct are one large velocity-type high-pressure burner and one small velocity burner, firing at an angle to the large one and into the same tunnel. The small burner is always operated and serves to hold the oven to temperature when no work is going through, and as a pilot light for the large burner. The large burner, connected to the automatic temperature control, is used while baking the cores.

A specially arranged firing tunnel and firing head are utilized, so that the combustion products from the tunnel are immediately mixed with recirculating gases, thus to decrease their temperature before being discharged into the oven from the distributing ducts.



CHARGING End of Ovens, Core-Making Machines and Conveyors Which Carry the Baked Cores and Return the Plates to the Oven Crew. Note pneumatic clamps on core-making machine at left, sand chutes over core-making machines and air lifts for handling plates



CHARGING End of One Oven, (at left side) with Conveyor. Return Loop from discharge is seen in extreme left background. At right center is return loop of discharge conveyor from other oven. Air is blown over the baked cores, to cool them so they can be handled by the time they have traveled to end of conveyor. Oven at left has a longer discharge conveyor, so that artificial cooling is not needed

Gases are taken off at a desirable point in the oven by a recirculating fan, which serves not only to return the gases, but also to pull in a certain amount of fresh air for proper oxidation of the cores. The remaining combustion gases are discharged from the oven through various openings.

Discharged Cores Move by Gravity

Baked cores as discharged from the unit are moved by gravity on roller conveyors to the front of the oven. Here the cores are shifted to a second conveyor, where they are inspected, pasted together, wired and then sent to storage. The plates are left on the conveyor and returned to the core-making machine, the transfer being made by an air lift.

Vecto heater cores are baked in a bank of four stationary gas-fired ovens, built of brick, 16½ ft. long, 10 ft. wide and 8 ft. high. Shallow pits underneath carry two manifolds, each supplying gas fuel to five burners, firing through the grating of the floor. These are used in conjunction with inspirators for exactly proportioning the gas-air mixture for perfect combustion and the correct oven atmosphere. Secondary air is admitted through vents in the rear setting, while six flues, three on each side, and located about 10 in. above the floor, are provided for exhausting the products of combustion.

The cores are rammed up in special core-making machines, and are loaded on to steel rack stands with the aid of pneumatic hoists. Owing to the dry sand binder, cores are charged into the ovens as quickly as possible, by electric trucks with high-lift platforms.

Each oven is charged with six racks and the burners are operated wide open (6-in. water) until a temperature of 380 deg. Fahr. is attained. One row of burners is then shut off and the temperature is maintained with the remaining manifold, until the work is discharged. This minimizes the time required to bring a cold charge up to temperature.

Comparative Tests of Differing Ovens

Two types of ovens in the same plant, operating on the same fuel and the same kind of work, afford a basis for comparative tests, from which valuable operating data have been obtained.

For every pound of cores put through continuous core oven there is at the same time included 1.84 lb. of steel. The gas consumption per 100 lb. of cores and steel is 16.2 cu. ft. The efficiency calculation based on 100 lb. of charge would be as follows:

B.t.u. of gas = 850
Charge = 35.2 lb. of cores plus 64.8 lb. of steel
Specific heat of steel = 0.127
Specific heat of sand = 0.195
Oven temperature = 450 deg.
Atmospheric temperature = 60 deg.
Temperature rise = 450—60 = 390 deg.
Heat in steel = 64.8 lb. × 390 × 0.127 = 3209 B.t.u.
Heat in sand = 35.2 lb. × 390 × 0.195 = 2676 B.t.u.

Total heat for 100-lb. charge = 5885 B.t.u.
Gas consumption = 16.2 cu. ft.

$$\text{Efficiency} = \frac{5885}{16.2 \times 850} = 42.7 \text{ per cent.}$$

Compared to this, on the batch oven for each 100 lb. of charge there are 57.8 lb. of cores plus 42.2 lb of steel.

Temperature of operation = 350 deg.
Atmospheric temperature = 60 deg.
Rise in temperature = 350—60 = 290 deg.
Heat in steel = 42.2 lb. × 0.127 × 290 = 1553 B.t.u.
Heat in sand = 57.8 lb. × 0.195 × 290 = 3268 B.t.u.

Total heat for 100-lb. charge = 4821 B.t.u.
Gas consumption = 22 cu. ft.

$$\text{Efficiency} = \frac{4821}{22 \times 850} = 25.8 \text{ per cent}$$

Continuous Ovens More Efficient Than Batch Ovens

From the test data one can see that the continuous oven is much more efficient than the batch type. Should the same proportion of steel and sand be used in the batch type oven, and operated at the same temperature as the continuous oven, instead of 22 cu. ft. for 100 lb. gross, there probably would be required around 35 cu. ft. This considerable difference in efficiency readily recommends the use of the continuous oven, from the standpoint of fuel consumption alone.

In addition to the lower fuel costs with the use of the continuous oven, operating expense and several other costs are reduced materially. A cut in labor cost through decreased handling results from the traveling conveyor systems. Indeed, for a sufficient number of periodic-type ovens to handle a production equal to that of one continuous oven, there would, perhaps, be required twice as many men for material handling. In addition, with

Core in Foreground Is Ready to Be Wired Together, Which Is the Last Operation

a large number of batch-type ovens, there is considerable truck expense necessarily involved in material handling.

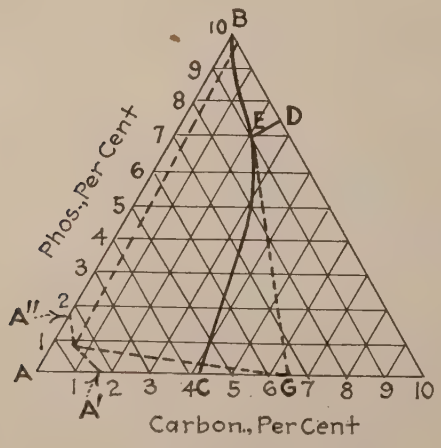
Better Costs Obtainable from Synchronized Work in the Oven

There is a further decrease in labor cost in coremaking when the various operations center along a continuous handling system. The speed of this part of the foundry is synchronized with that of the traveling conveyor in the oven. Of course the capacity of the oven and speed of the conveyor are designed to coordinate with the most efficient speed of the core makers. Considerable flexibility in the speed and capacity of the oven allows for variations in production rate, including making the cores, cleaning them, pasting halves together, blackening, etc., before the core is ready to deliver to the molder and to enter the production line.

Greater uniformity of temperature obtained with a continuous oven results in more uniform cores. With the continuous oven every core passes through each zone of heating, so, if there is a possibility of non-uniform distribution of heat in any part of the oven, each core is subjected to the same heat treatment as every one of its mates.

How Phosphorus Influences Graphite Formation in Iron Castings

CONCERNING the effect of phosphorus on the graphitization of cast iron there is expressed considerable difference of opinion by writers in the earlier literature. Generally it is supposed that phosphorus favors the precipitation of graphite. Observation of certain irons for thin-sectioned machine castings convinced von Keil and Mitsche that this was not the case and led them to attempt an explanation which would reconcile previous conflicting evidences. Their results are given in *Stahl und Eisen* for July 18, 1929. The explanation is based on the constitution diagram of the ternary system Fe-C-P, which is given herewith.



Constitution Diagram of the Iron-Carbon-Phosphorus System

It is known that, in the iron-carbon alloys, an increase in carbon above the eutectic composition is accompanied by a decrease in the tendency to form graphite. In the ternary system, it is evident that the iron-carbon eutectic, represented by CE becomes lower in carbon as the phosphorus content is raised. Hence a hypoeutectic iron may easily become hypereutectic when its content of phosphorus is sufficiently increased. This would presumably result in greater stability of the graphite, as is the case with pure hypereutectic iron-carbon alloys.

A series of melts made up with varying silicon contents and subjected to different rates of cooling indicates that the earlier observations attributed to phosphorus the ready separation of graphite which is really due to the presence of silicon and to a slow cooling.

Lacquered Pipe Proof Against Abrasion and Acids

Hammerproof and acidproof lacquer has been developed in Germany and applied to such products as steel pipe. Prof. W. Trinks, Carnegie Institute of Technology, Pittsburgh, told a sectional meeting of the American Society of Mechanical Engineers about it at Akron, Ohio, Oct. 23.

The lacquer, besides being virtually hammerproof, withstands, he says, even boiling hydrochloric acid. "The pipes to be coated are pickled, rinsed, dried and dipped in the lacquer, which is a phenol-formaldehyde condensation product; they are then baked and are ready for shipment. In places where pipes are cut, welded or threaded, lacquer is applied with a brush and baked with a blowtorch. There is only one thing wrong with this lacquer, namely, that the owners of the patent application ask for too much compensation for the rights in the United States.

"This lacquer is also being considered for structural material and promises to be a severe competitor to the new rustproof structural steels which contain copper and chromium. It is likewise a competitor to tin plate for cans, buckets, dishes, basins and so forth, and a competitor to zinc and lead not only for pipes but also for roofing sheets. Lacquered sheets can be doubled without cracking of the lacquer."

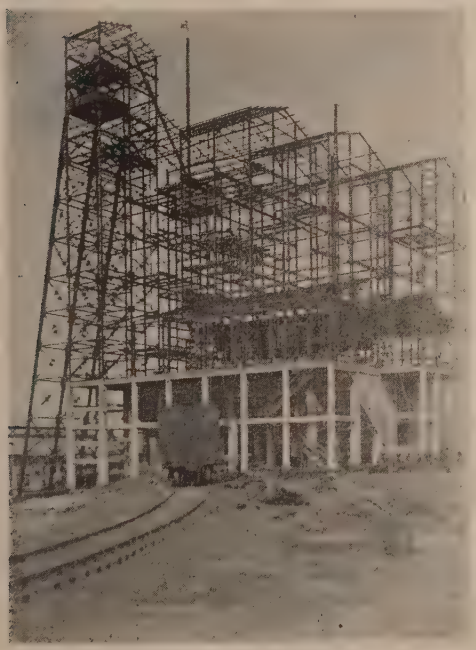
Steel Construction In Coal Mines

Rehabilitation of Locust Summit Breaker Emphasizes Progress Made in the Use of Steel in Pennsylvania Mines

BY FRANK W. JONES

PASSING of wood for important construction in and about the anthracite mines of Pennsylvania is emphasized by the large use of steel in the program of the Stone & Webster Engineering Corporation in its rehabilitation of the properties of the Philadelphia & Reading Coal & Iron Co.

About 25 years ago there were no steel coal breakers in the Pennsylvania coal region. Today, practically all new construction as well as important replacement and repairs are of steel. Illustrated are a typical wooden coal breaker of 25 years ago, compared with a steel coal breaker now in use, and the old method of heavy timbering



ABOVE, Modern Steel "Timbering" in a Coal Mine Contrasts Favorably with the Old Method of Heavy Wooden Timbering in Gangways. Below is the structural steel frame of a modern coal breaker compared with the Short Mountain breaker of 25 years ago, when wooden construction was general throughout the Pennsylvania coal region

of gangways compared with modern steel "timbering."

Impetus was given the use of steel when in 1912 the Mineral Spring breaker at Wilkes-Barre, operated by the Lehigh Valley Coal Co., was destroyed by fire and replaced by a steel structure. This construction was followed by other steel breakers, notably the Woodward, for the Delaware, Lackawanna & Western Coal Co. at Scranton, now the Glen Alden Coal Co., and the Nesquehoning breakers for the Lehigh Coal & Navigation Co., Lansford, Pa. The Woodward breaker required approximately 4500 tons of steel and the Lansford breaker about 8000 tons.

The initial unit of the Philadelphia & Reading Coal & Iron Co. at Locust Summit will require about 3000 tons of steel for the breaker, for the other buildings and for small bridges.

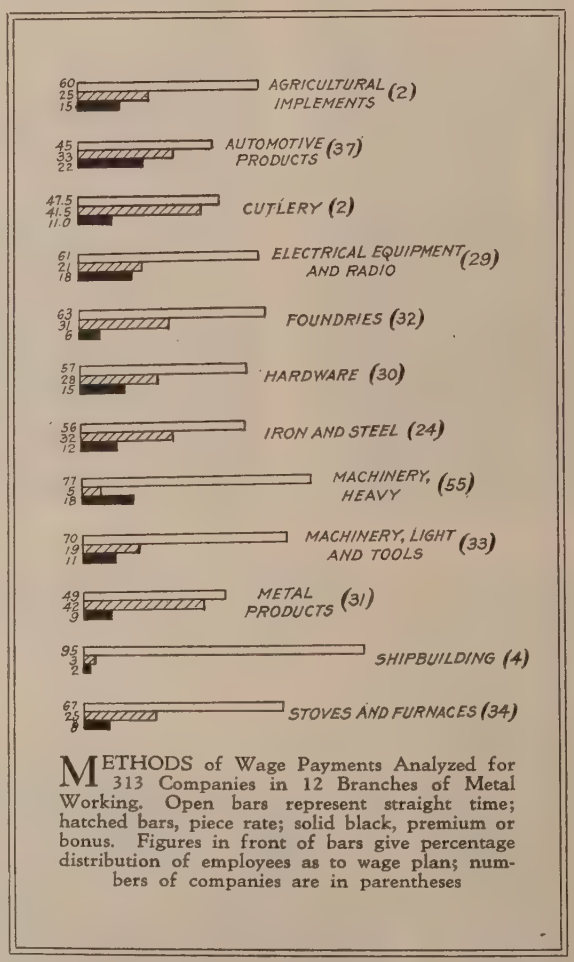
This provides for a structure with a capacity for the preparation of 12,000 tons of coal a day, which will supersede a number of smaller units now preparing from 1000 to 2000 tons of coal a day. The Chance flotation method of separating the slate from the coal will be used in this operation, so that hand slate picking will be entirely abandoned.

Varying Methods of Wage Payment

Two-thirds of Companies Use Straight Time; One-fourth, Piece Rate; Remainder, Bonus—Group Incentives in Metal Working

ANALYSIS of wage payment methods in 893 industrial companies having more than 500,000 employees shows that 66.4 per cent of the companies pay their men on a straight-time basis—either hourly, daily or weekly. These figures, compiled by the Sherman Corporation, Boston, show also that 24.1 per cent of the companies pay on a piece-rate basis, while the remaining 9.5 per cent pay on a premium or bonus basis. The latter are confined to those cases where definite standards are set and extra awards paid according to a planned schedule. No sporadic or opportunistic bonuses, vacations with pay, profit-sharing plans or life insurance are included.

Of all the companies reporting, 39 per cent had made changes in methods of paying wages during the past 20 years. These changes had been on a rapidly ascending scale, as 69.4 per cent of all had taken place between 1924 and 1929 and much smaller percentages in the three previous 5-year periods of the 20 years: 21.9 per cent in 1919-1924; 5.8 per cent in 1914-1919; 2.9 per cent in 1909-1914.



METHODS of Wage Payments Analyzed for 313 Companies in 12 Branches of Metal Working. Open bars represent straight time; hatched bars, piece rate; solid black, premium or bonus. Figures in front of bars give percentage distribution of employees as to wage plan; numbers of companies are in parentheses

Adoption of incentive plans had shown decreased manufacturing costs in 99.1 per cent of the cases. In the remaining 0.9 per cent of cases, manufacturing costs were increased. Similarly, employee earnings were increased in 99.7 per cent of the cases and decreased in only 0.3 per cent. As made, the analysis covered 43 different industries, with varying numbers of plants represented, from a minimum of two to a maximum of 74 in a single industry. The diagram herewith accounts for 12 of the industries lying within the specific field of metal-working.

The numbers in parenthesis after the name of the industry represent the number of concerns in the survey. The numbers standing in front of the several bars for each industry represent the percentage of employees being paid on the basis shown. The unshaded bar represents straight time; the cross-hatched bar, piece rate; and the solid bar a planned premium or bonus arrangement.

One of the outstanding developments in incentive method in paying wages during the past three years is said to have been the growing adoption of group methods rather than individual incentives. Group plans of one kind or another were found particularly noticeable in the automotive, heavy machinery and light machinery classifications.

W. Jett Lank, in his new book on "New Industrial Revolution and Wages," is inclined to the position that regardless of the method of payment, the total wages paid should be such as to insure a high rate of productive efficiency. Whereas much used to be heard of the "living wage" and the "cultural wage," he believes that industry has irrevocably committed itself in a practical and concrete way to the attitude and policy that wages may increase indefinitely so long as unit labor costs are not increased or profits reduced. For the immediate future, the pressing problem will undoubtedly be the working out of the proper share which the various occupational groups will receive in these enhanced wages.

Forge Shop for Aluminum Alloys

Furnaces, Hammers and Heat-Treating Equipment Installed for Daily Capacity of Ten Tons; Sizes Range from Tiny Parts to Airplane Propellers or Locomotive Side Rods

MANUFACTURE of aluminum forgings from strong alloys on a commercial basis was started about ten years ago by the Aluminum Co. of America at its Cleveland plant. Since then there has been important progress in the development of suitable alloy compositions to meet special requirements and perfection of heat treating processes, the application of which has resulted in improved physical properties of the metal. With the production of wrought alloys of greater tensile strength and increased hardness the field for forgings has been materially broadened, and this branch of the aluminum industry as well as the market for aluminum castings and rolled products has enjoyed a steady growth. The rapid advance of the aircraft industry, that demands engineering metal combining both strength and lightness, is probably responsible more than any other factor for the marked expansion of the market for aluminum forgings.

Hand in hand with the development of aluminum alloys, important improvements in dies and die making practice have occurred. The company's engineering and research departments have devoted much attention to designing parts to permit them to be made from forgings. Parts are now being forged of aluminum that it is claimed would not be attempted with steel.

Surface of Forging Billets Must Be Perfect

A NEW aluminum forge shop with a yearly capacity of 6,000,000 lb. (approximately 10 tons per day) of finished forgings is being built by the Aluminum Co. of America at its Cleveland works, and will soon be ready for operation. This company has pioneered in the production of aluminum forgings and the experiences it has had and the marked progress it has made in this field form a substantial basis for laying out and providing with mechanical equipment a plant arranged for the continuation of the methods and practices that it has successfully developed.

The secrets of the company's success in making aluminum forgings are mainly metallurgical. They include metallurgical control of the composition, proper forging temperature, close temperature control in heat treating and proper design of the forgings. Standard types of hammers such as are used in forging steel are employed. However, some of the operating methods differ from those followed in a steel forging shop; for example, highly polished dies are used and special methods of lubrication are required.

Production of aluminum forgings has presented two other major difficulties not encountered in the production of steel forgings.

At the beginning there was no stock available that was suitable for forgings. It was necessary, therefore, to develop methods and plant for making stock coincidently with the development of the forging business. This problem proved to be a very considerable one, with the result that up to date most of the stock used has been prepared in the forging department itself.

A good surface is more difficult to obtain on aluminum forgings than on steel. The scale which forms on the latter has been a blessing in disguise, for with its removal many skin-deep imperfections disappear. No such scale forms on aluminum forgings—hence, skin-deep imperfections must be avoided. In order to accomplish this result much greater care—with its incidental expense—is required in the preparation of the stock for forging.

Hammers Operated by 100-Lb. Air

AS the mechanical processes involved in forging aluminum do not differ materially from those for steel, the new aluminum forge shop is very similar in mechanical equipment and in general appearance to a well equipped forge shop. The buildings are arranged somewhat in the form of a U. The forge shop is 300 ft. long and 80 ft. wide. Parallel to it and separated by an open court 40 ft. wide is a building 50 x 240 ft. occupied by the die room and shipping department. At right angles to and connecting these two buildings at one end is the heat treating department, 60 x 170 ft. This arrangement permits convenient straight line routing of work through the forge shop, heat treating department, inspection department and finally to shipping room. The plant is designed so that extensions can be added to triple the present floor space.

Equipment includes two 18,000-lb. and one 14,000-lb. Erie drop hammers and also a 12,000-lb. Chambersburg hammer for forging large pieces such as aeroplane propellers and crank cases. An open frame 5000-lb. forging hammer will be used for making locomotive side and connecting rods, street car forgings and other large hand forgings. Eight smaller steam hammers and three board drop hammers ranging in capacity from 1000 to 3000 lb. will handle the smaller work.

All hammers will be air operated. In the existing forge shop it had been found that the use of air instead of steam for hammer operation is more economical, both in hammer upkeep and in power consumption. Advantages claimed for the air operated hammer are that the power can be shut off when the hammer is not being used (continued operation being necessary with steam hammers to keep the condensation low), there is no hot water running from the hammer as when steam is used, the pressure is always uniform and there is no danger of cracked cylinders from freezing during the winter.

Air will be supplied to the hammers at 100-lb. pressure by an 8000-cu. ft. Nordberg air compressor located in a separate 55 x 80-ft. building at the side of the forge shop. (This compressor has aluminum pistons, aluminum crossheads and forged aluminum connecting rods.) A receiver just outside the building delivers to a main supply line to which feeder lines connect each hammer. Three surge tanks will maintain a uniform air pressure when there is a heavy drain on the system. Intake and exhaust pipes are underground, the main exhaust line extending lengthwise under the center of the building.

Forge Shop of Glass and Steel

THE forge shop is 44 ft. high, providing sufficient room for handling all hammer parts with a crane except the sub-bases and anvil blocks. This arrangement

will be found particularly convenient in handling hammer rods. The shop is served by a 15-ton Cleveland traveling electric crane, with 5-ton auxiliary hoist.

The shop is of steel frame construction with glass sides with the exception of a band of corrugated iron at the crane rail and a section of the building just above the floor level in which are sliding 9 x 9-ft. wooden doors (the only wood in the building). It has a flat gypsum roof. Window sash are steel, with motor-operated ventilating sections.

Hammers are mounted on substantial concrete foundations, those for the larger units extending from 17 to 22 ft. below the floor level. Concrete runways are laid between the hammers. Most of the hammers will be served by two continuous electric heating furnaces, so that there will be no danger of the hammer-men getting cold metal. The speed of the furnace conveyors will be regulated to bring the material to the proper heat, as indicated by a thermocouple, of 750 deg. to 850 deg. Fahr.

Larger forgings will be hot-trimmed on presses adjoining the hammer and smaller work will be cold-trimmed and brought down to size on coining presses, for which Bliss and Consolidated equipment will be used.

Heat Treating Done in Pit Furnaces

FOUR pit-type electric furnaces are provided in the heat treating department. These are approximately 5 ft. diameter and 12 ft. deep, with tops about 2 ft. above the floor. This building has a basement to permit easy access to the furnaces for repair work, and to provide good ventilation.

Forgings on leaving the trimming presses will be placed in stainless steel baskets 55 in. diameter and 3 ft. deep and holding 2000 to 3000 lb. In these they will be handled in and out of the furnace by an overhead electric traveling crane. The forgings will remain in the furnaces from 6 to 18 hr., depending on the size of the section, but the practice will be to maintain a uniform heat treating temperature of 960 deg. Fahr., plus or minus 10 deg., on all classes of work. At this temperature the hardening constituents go into solution in the aluminum and are retained in a high degree of dispersion by the quenching operation.

After quenching, the tensile strength, yield point and hardness are further improved by aging either at ordinary temperatures (in the case of the alloy known as 17S), or at 310 deg. Fahr. in the case of alloys 25S and 51S. The artificial aging of the latter two will be done in the same furnaces as were used for heating, they being equipped with high and low temperature controls.

Furnaces are controlled by Wilson-Maeulen instruments; Tapalogs located in an instrument room record the temperature on charts. The switch panel, relay and instruments are suspended on springs to avoid the effects of vibration caused by the hammers.

Three alloys are used for forgings, these (after heat treating) being designated 17ST, 25ST and 51ST. Alloys 17ST and 25ST have a minimum tensile strength of 55,000 lb. per sq. in.; 51ST of 40,000 lb. per sq. in.; the yield point is 30,000 to 40,000 lb. per sq. in. for all three; elongation is 16 per cent for the former two and 12 per cent for the latter; Brinell hardness is 100 for all three alloys. These properties are obtained from standard size test specimens taken in the direction of maximum flow of the metal. Specific gravity ranges from 2.69 for 51ST to 2.79 for 25ST, or about one-third that of steel.

Rigorous Testing and Inspection

FOLLOWING the practice in the present forge shop, all forgings will be etched to provide a bright surface so that all defects in the forging, even minute line cracks, can be seen. The etching operation includes immersing the work in a caustic solution, washing it in warm water and then giving it an acid dip.

A testing laboratory is maintained for all forge shop products. Every heat is analyzed and the analysis of the bar stock accompanies the material from the rolling mills through the forging processes. Bars are tested for physical properties before they go to the hammers. Large pieces, such as airplane propellers and crankcases, carry a serial number and a test bar which accompanies them through the work until the forging and heat treating is completed, thus providing 100 per cent inspection of physical properties. The new forge shop will have a testing laboratory equipped with a set of indicating tensile testing machines supplied by Alfred J. Amsler & Co., as well as other testing equipment.

As a result of such care in the composition, forging, heat treating and inspection, it is stated that there have been no failures of forgings that could be attributed to the quality of the forgings. Forgings are now being made of a wide range in sizes and uses, extending from locomotive side rods weighing 700 lb. down to small parts for vacuum cleaners, typewriters and sewing machines. Among the more important forgings are airplane propellers and fittings, and various other forgings used both in aircraft and automobiles, including crankcases and connecting rods. Other common uses for aluminum forgings are for spray gun bodies, pneumatic tool parts, and connecting rods and other parts for outboard motors.

Plastic Seal for Stopping Gas Leaks from Furnace Settings

IN describing a large German open-hearth furnace some months ago a writer in *Stahl und Eisen* referred particularly to insulation on the four regenerator chambers. Steel plates were placed against the walls from the top to a depth of about 20 ft. The object was to prevent infiltration of air and at the same time gas leakage through the joints of the brickwork.

It is said, however, that this purpose is served only partly, as the gas presses through the joints and cracks in the walls, rises between the walls and the casings, and escapes where the plates terminate. This leakage is said to be especially noticeable when mixed gas is burned.

All attempts to stop this leakage by filling the cracks and holes with mortar have proved futile. Investigation with an experimental chamber at the Ruhrort-Meiderich Steel Works showed unexpectedly high figures for losses caused by air infiltration and gas leakage. In this chamber an effective seal was obtained by applying between the bricks a plastic sealing material which would permit the walls to expand and contract without breaking or cracking joints. This plastic mass, known as "Aerodensit," was applied also to the regenerator chambers.

It is said to be economical in application and low in cost. After the roofs had been sealed the success of the device was said to be evident, but figures for savings were not given. In building new furnaces it was planned to apply this material between the joints and over the brickwork and not to use steel sheets. Thus the exposed brickwork can be inspected whenever desired, which, of course, the steel casing does not permit.

Making Motor Integral with Machine

Builders, in a Revolutionary Economic Change, Are Coming to Merge the Power Units Into the General Composition of Industrial Machinery

BY WALTER STUART KELLEY

WHAT he terms a new epoch in machinery construction is now under way, according to Mr. Kelley, who is a consulting engineer of Boston and owns to an experience in mechanical design dating from 1890 and in electrical design dating from 1906.

An introductory article by Mr. Kelley appeared on page 1229 of THE IRON AGE of Nov. 7. This pointed out how the new development, revolving about the application of power, means a breaking away from tradition in not trying merely to replace hand power; also in making the power centers internal rather than external parts of a machine and finally in considering the manufacture of the power units a function of the machinery builder himself.

FUNDAMENTAL conditions that presaged a revolution in machine design were noted in a previous article. An epoch-making change was there forecast, by reason of freer use of electric means to impart motion (and power) directly at one or more points, rather than, as heretofore, to carry the initial motion throughout the machine.

The reason for redesigning machinery to make electric drive (or drives) an integral part of the machine is not merely to effect a theoretical gain, but to secure a very substantial improvement that will result. The warrant for such redesign is solely the resulting gain to the builder or to the user, or to both.

This new principle in machine design is already evidenced by various electrically-driven tools and appliances recently put on the market. It is to be noticed in certain instances of electric drive on a large scale in the steel mills. Practical application of the idea has enabled the writer to cut the floor space in one manufacturing process more than one-half.

Not every machine is adapted to such redesign. Many are, and in some cases there will result radical changes in organization and appearance.

Advantages of Integral Electric Drives

THE advantages to accrue are manifold. The most important are: less wear, less attention, less maintenance, less power, greater efficiency, less floor space, improved quantity and quality of product. The last will result chiefly through the elimination of variable speed caused by belt slippage. Few manufacturers realize to what extent production is lost and quality sacrificed through belt slippage. Graphs made by instruments that record instantaneous irregularities show amazing variations of speed in supposedly well equipped factories. It is not unusual with mechanical distribution of power to find five, six and occasionally eight belts between the prime mover and the driven machine. Each belt intervening is an element of variable slip, progressively because of gradual stretching, and from day to day because of changes in temperature or humidity. Momentary variation in speed may be 6 per cent above or below normal. In such a case, if the speed is made absolutely uniform, the running speed can be raised to the average maximum of the variations, with a gain of say 5 per cent in production.

The implications of the impending changes in machine design are many and varied. Broadly, of economic interest to the whole country, is the production of better goods at less cost, because of reduced floor space, greater efficiency and higher productive speed. This will be especially true of goods produced for the ultimate consumer. It is evident that when these results are realized, even with individual machines, the manufacturer must perforce scrap out-of-date equipment and install the new. He should sense this early enough to prepare for it through the depreciation account.

As a corollary to this situation it is evident that when manufacturers of machinery themselves build electric drive into their machines, there will be a materially lessened demand for standard type motors as now built by electrical manufacturers. This will be particularly true of the larger sized electric motors, with general acceptance of the individual-drive idea.

Power Application Viewed as External Thing

IN certain lines of production the essential features of the machinery used have not changed since power machines were first built. This is especially true with respect to machines originally designed and built for hand operation. With these and other early forms of machines, the first fifty years were required to eliminate the difficulties that developed because of the different conditions introduced by power drive. During the last fifty years crudities have been eliminated, refinements added and the use of the machines extended.

Textile machinery affords an excellent illustration of the developments following the application of power to hand machines. The hand mule—in use 60 years ago—was simply the hand spinning wheel with a hundred or more spindles instead of one. Power was used to turn the large number of spindles, hand operation was closely copied, even to the use of a gig wheel. With mule spinning today the same movements are automatically reproduced by power. The plain goods loom now used has the same parts as the old hand loom with some added refinements; it is a very interesting combination of reciprocating and rotary movements, both fast and slow. The original power card is essentially reproduced in the card now built. Textile machinery as a whole offers a very attractive field for redesign with built-in electric drive.

The greatest invention has been displayed in ma-

chinery originated more recently expressly for power operation, where there has been no incentive to copy former hand movements. In this class may be mentioned, by way of illustration, machine tools and shoe machinery, all of which has been designed expressly for power drive.

The fundamental idea of electrical power distribution is diametrically opposed to that of mechanical power distribution. That fact, plus force of habit, are the explanation why few men with strictly mechanical training are qualified to lay out properly and efficiently an electric drive, much less undertake electrical design. It accounts, too, for the rather slow application of the individual drive idea.

Mechanical distribution of power by shafts, pulleys and belts—practically the only method in use fifty years ago—drives each machine through these mechanical agencies from a single prime mover; whereas, with complete electrical distribution, belts and shafting are dispensed with and what is essentially a prime mover, applied directly to each machine, or, better still, incorporated in its construction. The comparison is between distribution and concentration.

Now it is obvious that with electrical concentration of power in each machine, the manufacturers of shafting, large belts, pulleys, bearings, etc., will face a gradually diminishing market for such products; likewise the builders of engines of all sorts not adapted for driving electric generators. Engine builders face the elimination of small prime movers, except where electrical transmission is not available, as with boats. More and more as time passes will electricity prevail in power applications; electricity furnished by large power stations, parts of an extensive super-power network. The so-called isolated, or local, power plant is doomed; those who manufacture apparatus for such plants must look elsewhere for their business.

Machinery Builder Will Make Electrical Parts

THE one most directly and intimately affected by these epoch-making changes in business alinement is the machinery builder. He must accept the situation and prepare for it, or change his line, or curtail. Assuming the machinery builder affected elects to swim with the tide and redesign his line, will he build the electrical parts for his machines? He cannot well do otherwise. The relation of parts is too intimate and specialized to have them made in different shops. This does not oblige him to face the exploration of an electrical or technical labyrinth. The obstacles are largely mental.

Alternating current will be used for most electric drives; the motors are mostly machine work with simple and easily made electrical features. The stationary electrical member, the stator, will have lateral slots into which formed coils of insulated wire are fitted. Making and fitting these coils is the only essentially electrical feature of the machine except in special cases where speed control is required. Electrical design is practically an open book today. There are no basic patents to make trouble. The first concern in the field, however, in the design of any particular line of machinery will be able to protect its own designs by construction patents that will trade-mark its output.

One Experience in Combining Motor with Machine

IN working out a particular case where the driving motor was incorporated as an integral part of the machine, the simplicity of the motor construction was surprising. The only parts added for the motor were two laminated rings of metal, one attached to the revolving part of the machine and the other to the end frame. There were neither casing, bedplate, shaft nor bearings, corresponding to such parts of a standard motor. What represented them were essential parts of the machine. The motor drive reduced floor space and added nothing to the machine that required attention. The only additional machinery needed for making the motor parts was a press to punch out the laminations for the rotor and stator rings. Given the data for the motor design, the only new help needed was for making the coils for the stator section. The cost will be less than for a standard type motor; the power used will be less too.

Such machinery is all to the good for the factory using it. When it is available in quantity none other will be used where electricity is available. The only adverse factor is that the builder will have to make and stock a different line of parts for each machine built. This is a matter deserving consideration, for it may mean a change in the line of machines that a manufacturer builds. The difficulty seems serious, but it is nine-tenths mental.

Suppose a shop is building, say, 20 different machines, used successively in producing one line of goods. By tradition and habit—mental habit—the management thinks it must continue to produce the entire line of machines. But there would be at least one electric motor drive for each machine, and for some machines perhaps two or three, say altogether thirty motor parts to be made and stocked. This would be too many to produce at low cost for the number marketed unless manufacturing was on an extensive scale.

The manufacturer is therefore confronted with the necessity of making, what is to him a momentous decision—of breaking with tradition. Will he continue to build the full line of 20 machines, with active competition on each one, or will he narrow his production to one-fourth as many (or even less), and produce in quantity the ones he continues to build? Good judgment dictates the latter course, for besides wisely meeting his particular case, it is in line with the twentieth century principle of economics—lower cost through mass production.

Deoxidized Copper for Welding

SINCE the small amount of oxygen purposely remaining in pure copper slabs, bars, plates and sheets makes it impossible to weld this material satisfactorily, copper and brass mills have placed on the market a deoxidized copper, according to W. R. Hibbard, technical department, American Brass Co., Waterbury, Conn., speaking before the recent meeting of International Acetylene Association. This is made by adding sufficient deoxidizer to the molten copper to remove all oxygen; usually a slight excess is added, as it is hard to know exactly how much oxygen is present in the metal.

Common deoxidizers for this purpose are phosphorus, silicon, manganese, zinc, cadmium and calcium boride. With the exception of the last one, the slight excess of deoxidizer remains in the copper; the boride takes up oxygen and floats off with the slag. From 0.03 to 0.15 per cent of the others may be residual (except cadmium, which is liable to run from 0.10 to 0.50 per cent).

A weld made with deoxidized copper will process easier and have nearly twice the strength of one made with electrolytic copper. There is one disadvantage to deoxidized copper and this is where high electrical conductivity is required. Very slight percentages of some deoxidizers decrease the electrical conductivity, in the case of phosphorus cutting it to one-fifth its normal value.

Corrosion by Superheated Steam

Investigation of Large Operating Boilers and High Pressure Experimental Boilers Indicates That Steel Is Corroded at Negligible Rate

BY J. K. RUMMEL*

WITHIN the last few years in central stations, steam pressures have been increased from 250 lb. to 1400 lb. per sq. in. and steam temperatures have increased from 600 deg. Fahr. to 750 deg. Fahr. at the superheater outlet. Even higher steam pressures and temperatures are being considered. Abroad, slightly higher steam temperatures have been in use on smaller installations at lower capacities than are common in America.

This trend toward increased temperatures and pressures, together with certain operating experiences, made it desirable to study the probable extent of the reaction beween iron and steam at the elevated temperatures existing in steam superheaters. This reaction, which proceeds at a low rate at temperatures around 900 deg. Fahr., and probably approaches maximum velocity at approximately 1470 deg. Fahr., may be expressed

$3\ Fe$	$+\ 4\ H_2O$	$=$	Fe_3O_4	$+\ 4\ H_2$
Iron	Steam		Magnetic iron oxide	Hydrogen

Since the early part of 1926, the service department of Babcock & Wilcox Co. has investigated five boiler units which represent a considerable range in operating conditions. These installations, designated as *A*, *B*, *C*, *D*, and *E*, are described in Table 1. Briefly the conditions were as follows:

A. Radiant heat superheater, 3-pass. Last pass equipped with Enduro KA2 tubes. Pressure: 200 lb. gage. 100 per cent makeup water treated, in the boiler, with soda ash, sodium phosphate and quebracho.

B. Stirling type boiler with convection single pass superheater. Pressure: 400 lb. gage. Feed water: all condensate with low oxygen content.

C. Babcock & Wilcox boiler with interdeck 3-pass superheater. Pressure: 600 lb. gage. Feed water: condensate from condensers using zeolite and acid treated makeup water. Practically no oxygen in the feed water.

D. Similar to C, except that the makeup water was distilled; the water to the evaporators being pre-treated in a lime and soda ash treating system. Practically no oxygen in the feed water.

E. Experimental boiler. Pressure 1500 lb. to 3200 lb. Feed water: condensate with sodium phosphate addition but with poor control of oxygen content.

The method used for measuring the rate of corrosion is based on the evolution of hydrogen by the reaction quoted above and the measurement and analysis of the gas in different parts of the system. Methods of sampling, gas separation and analysis were developed.

A selection of the results are reported in Table II for these five installations, representing operating pressures from 200 to 3200 lb. per sq. in. and final steam temperatures ranging from 600 to 790 deg. Fahr.

Method of Sampling and Gas Analysis

With minor modifications at different stations, the method of separating the gas from steam or water, at the desired sample points, is as illustrated on page 1527.

The sample, entering at the point marked "steam in-

let," first passes through a condenser where the steam is condensed and cooled to approximately room temperature. As shown by arrows, this condensate passes in turn through a gas separator, water tank and waste line. The rate of flow through the apparatus is estimated at intervals by directing the condensate into the measuring cylinder. When the water tank has been washed free of deaerated water with which it was previously filled, the gas collector at the outlet is filled with fresh condensate; the gas in the gas separator is transferred to a gas receiving bottle (marked "gas holder") and the sampling operation is stopped. The water in the tank is now boiled until free from dissolved gases, (by means of the steam coil therein), and the flow of steam and liberated gas from the top of the tank is passed into the gas collector. Steam condenses in the collector, while the gas rises to the top and is withdrawn into a separate gas receiving bottle. (The first gas separator is used to collect any free gas in the condensate, while the tank and second gas collector make it possible to recover the gas which remains dissolved in the condensate.)

The two gas samples, representing free gas from the gas separator and the dissolved gas from the tank, are then analyzed and measured in a Burrell (Bureau of Mines) Orsat apparatus; determining carbon dioxide, oxygen, hydrogen and carbon monoxide. Nitrogen is

found by difference. Tests for hydrocarbons gave no more than traces.

From the data obtained, is calculated the volume of total gas per thousand pounds of condensate as sampled, and from this and the calculated average analysis of the gas in the sample, is found the pounds of each gas per million pounds of steam generated. The average analysis of the gas is calculated from the ratio of the water passed through the separator to the capacity of the tank and the volumes and analyses of the gas from the two sources.

Discussion of Data

The items of particular interest are the amounts of hydrogen made and the amounts of oxygen consumed under different operating conditions. From these may be inferred the amount of corrosion, by assuming that all of the hydrogen formed is the result of the reaction between iron and steam and all the oxygen consumed in the system is the result of its combining with hydrogen to form water. Under these conditions the formation of one pound of hydrogen would be equivalent to 20.744 lb. of iron and the consumption of one pound of oxygen would be equivalent to 2.617 lb. of iron. Thus, if a system generated 0.02 lb. of hydrogen and consumed 0.1 lb. of oxygen per million pounds of steam, the loss of iron in the system would be 0.677 lb. of iron. While this figure is considerably higher than found in any of the large boiler installations examined, (installations *B, C* or *D*), it is estimated that if this loss were distributed evenly over their entire surface, the tubes therein will give a satisfactory length of service before failures are likely to occur.

It is well known that hydrogen may be produced in the boiler system by reactions other than the one outlined above, and oxygen may be consumed in other ways than by combining with hydrogen gas. For example, the iron may corrode by combining with water to form ferrous hydrate and hydrogen gas, and the oxygen present then promote the oxidation of ferrous hydrate to ferric hydrate and iron oxides. It is therefore apparent that the iron equivalents for hydrogen and oxygen as given, are subject to interpretation depending on the existing conditions at the time the gas samples are taken. The probability that several simultaneous reactions take place in the system, makes it difficult to reduce pounds of gas to pounds of iron in the data presented.

Experience has fully justified the recommendation that oxygen in the feed water should be reduced to as near zero as is practically possible, in order to protect the surfaces in contact with both water and steam. This recommendation applies to the protection of superheaters as well, since there is ample evidence that superheater tube failures by corrosion have been greatly accelerated by the presence of oxygen in the steam.

Small scale experiments by C. H. Fellows (a) and J. Porter (b) have demonstrated that the reaction between iron and steam does not reach serious proportions in steel superheaters until the metal reaches or exceeds 950 deg. Fahr. Below 1000 deg. Fahr. the formation of hydrogen and iron oxide is found to increase slowly as the temperature increases. Above 1000 deg. Fahr. the formation of hydrogen and the corrosion of the metallic surface is considerably more rapid per unit increase in temperature. With tubes made of the alloy known as Enduro KA2 the rate of corrosion is considerably less and higher temperatures are permissible.

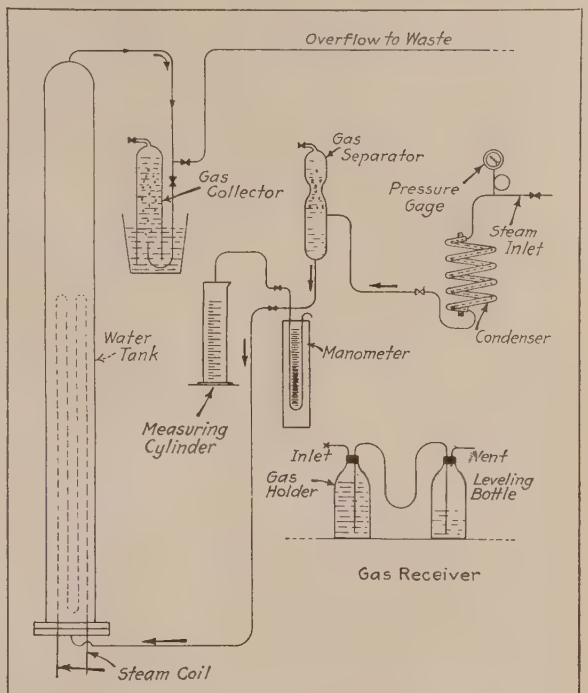
The general conclusions which may be drawn from the information available to date, are:

1. With oxygen-free steam, corrosion, due to the rate of reaction between steam and superheaters made with steel tubes, is negligible for steam temperatures up to 800 deg. Fahr. and tube temperatures up to 950 deg. Fahr.

2. The use of superheaters made with Enduro KA2 tubes with temperatures on the fire side up to 1200 deg. Fahr., is not limited by the reaction between iron and steam.

3. Hydrogen gas evolution (and corrosion in general) is accelerated by oxygen entering the system with the feed water, and the oxygen content of this water should be reduced to the lowest practical amount.

4. Within limits, the alkalinity of the boiler water will have no noticeable effect on the rate of reaction between iron and steam. A definitely alkaline boiler water and boiler feed water is preferred to prevent acid corrosion and limit corrosion due to other conditions. However, alkaline water does not stop corrosion due to oxygen.



Analytical Equipment for Measuring Gases in Steam Withdrawn from High-Temperature Superheaters

(a) Paper by C. H. Fellows of the Detroit Edison Co., before the American Water Works Association, at Toronto, 1929.

Study Liquid Shrinkage of Metals

Progress in the investigation of the problem of liquid shrinkage, being carried on through the cooperation of the American Foundrymen's Association and the Bureau of Standards, is indicated in a report submitted by E. J. Ash, research associate for both organizations, to the committee on cast iron of the A. F. A.

A new procedure has been developed which is termed the crucible immersion method. This consists in immersing a crucible of known volume into a ladle of molten metal and filling the cavity of the crucible, allowing sufficient time for the crucible and the metal to reach a temperature equilibrium. When this state is attained a lid is pressed down firmly on the crucible and the whole removed from the melt. After cooling, the resultant ingot is weighed, and through the known volume of the crucible the specific volume value of the metal at the temperature of sampling may be determined.

Furnace Construction; Operation

Open-Hearth Men Consider Design of Furnace, Use of Auxiliary Equipment, Insulation, Character of Ports and Checker Brick

FUNDAMENTAL matters connected with the design of open-hearth furnaces were taken up, along with questions of quality control for steel and many other matters, at the autumn meeting in Chicago of the open-hearth committee of the American Institute of Mining and Metallurgical Engineers. The rapid-fire discussion of all these topics, participated in by operating men from many different steel plants, with no set papers and nothing printed, made this meeting one of unusual interest. The following pages conclude the story. The first section was on pages 1307 to 1310 of our issue of Nov. 14; the second, pages 1382 to 1384 of our issue of Nov. 21.

Auxiliary Equipment of an Open-Hearth Plant

BRIEF description was given by F. B. McKune, Steel Co. of Canada, Hamilton, Ont., of two new furnaces which he has installed within the past year The bath measures 15 ft. 6 in. x 42 ft. in surface area and has a depth of 3 ft. net. The foreplate is 4 ft. above the brick bottom of the furnace. This furnace over all is 77 ft. 6 in. long and the heat is 135 gross tons.

Regenerators are 23 ft. long and measure 20 ft. 6 in. high to the spring of the arch, the latter being 2 ft. 10 in. high. The brick checkers are 13 ft. 6 in. high. Air chambers at each end are 16 ft. 1 in. wide, while the gas chambers are 11 ft. 6 in. wide.

These furnaces are fitted to burn a combination of blast furnace and coke oven gas varying in proportion from 5 to 1 to about 2.3 to 1. The average fuel used in this mixture has a heat value of about 240 B.t.u. to the pound. One of the furnaces is fitted with control regulators.

During August, September and October more than 180 heats were taken out of the furnace with controls, with the following results:

	Heats	Tons of Ingots	B.t.u. per Ton
August	61	8,147	4,250,000
September ..	58	7,839	4,300,000
October	67	9,028	4,300,000
Total	186	25,014	

Average charges in October amounted to 143.6 tons, with heats averaging 134.8 tons. For the month, heats were made at the average rate of 12.1 gross tons an hour. These proceed at a very uniform rate, as many successive heats have been made with differences of not more than 10 min. between them.

It is the hope that tar may be burned in combination with blast furnace gas in these furnaces, using 16 or 17 gal. of tar to the ton of ingots and getting the remainder of the heat from blast furnace gas. The present stack temperature of about 1000 deg. Fahr. should be reduced to 800 deg., with proper control.

About 130,000 checker brick are used, measuring 4½ by 9 in. and with 54 sq. in. openings. The gas is not regenerated. Comparing the two furnaces, the automatic control arrangements drop the checker temperature about 200 deg. The two chambers, side by side, are running at about 2200 deg. for gas and 2100 deg. for air.

Blast furnace gas is heavy enough so that it lies close to the bath while burning. The port roofs are insulated and this is to be extended from each end of the main roof through about one-quarter the length of the roof. Thus, some 70 per cent of the total roof of the furnace will be insulated. The gas checker chamber is insulated, but the air is not. There is a brick stack 8 ft. in inside diameter and 225 ft. high.

Reversals are on a 20-min. schedule. This is found to accompany a drop of 110 deg., approximately, in regenerator temperatures. Complete combustion is obtained at about the center of the furnace. Some 260 B.t.u. for fuel is used for melting and then gradually the mixture is cut down until it reaches about 180 B.t.u., representing about six parts of blast furnace gas to one of coke oven gas. The port through which the gas comes is 9 ft. long, with a slope of 3 in. to the foot and sectional area of 1700 sq. in.

Thermal Units Consumed

Discussing heat economy in furnaces, one producer gas plant making steel castings reported about 4,500,000 B.t.u. consumed for each ton of metal charged. The producer is burning 550 lb. of coal at about 85 per cent efficiency. A natural gas furnace burning 5500 cu. ft. to the ton accounted for about 5,500,000 B.t.u. An oil furnace using 30 gal. to the ton, at 155,000 B.t.u., reported 4,655,000 B.t.u.

Other scattering reports showed 4,370,000 to 6,250,000 B.t.u. on producer gas, 6,700,000 B.t.u. on pulverized coal, 4,750,000 B.t.u. on natural gas, 5,000,000 to 5,900,000 B.t.u. on oil, 5,500,000 to 6,500,000 B.t.u. on tar and 4,300,000 B.t.u. on a mixture of blast furnace and coke oven gas.

A fuel engineer observed that it is possible to attain practically the same furnace efficiency, regardless of fuel, if the furnaces are designed properly for the fuel which is to be used.

Changing Producer Furnace to Natural Gas

IN making a change whereby a furnace built to burn producer gas is fired with natural gas, the opinion was expressed that the natural gas flame must be given a positive direction or it is likely to burn out the roof. There should be a pre-mixing burner. There will be little or no change needed in the uptakes. If a furnace is built with a single uptake, the initial cost is less than when three are fitted. Renewals, however, are more costly and the furnace may burn out the supporting wall.

Problems in Furnace Insulation

ONE plant has put Sil-o-Cel C-3 in the pan bottom of a furnace and has used less brick under the burned-in bottom surface. This furnace has made more than 700 heats; it is reported to be much cooler beneath this furnace than with the ordinary type and the bottom is holding up well.

In another plant a new 100-ton furnace, not yet in operation, has been insulated with 3 in. of C-3 cement, covering the rivet heads, and one course of C-22 Sil-o-Cel brick. Then there are four courses of fire-brick, 3½ in. of magnesite cement and then 17 in. of fused magnesite to make the bottom. The side walls have eight courses of C-22, making about 18 in.

Insulating checker chambers without changing the old walls was regarded as something of a makeshift. In one plant 1½ in. of Webber composition was daubed on, but it is now peeling off a bit. In another case, wire mesh has been fastened on the wall, and insulating cement thrown at it with a gun, by the Johns-Manville method. Still another plant has put 2½ in. of Sil-o-Cel on the roofs and covered them with Silcote. This has cracked open and the roof shows red hot through the cracks. This brings up the question of the structural steel

in there, which is not designed to stand a red heat.

One plant has used magnesia block over the regenerator chambers, covered with a steel mesh and Sil-o-Cel cement, and the whole thing inclosed in steel plates. Another man reported, however, that insulating engineers no longer advocate the use of steel plate. When holes form in the brickwork back of the plate they cannot be got at for patching. It was suggested that the plate might be put on in panels, easily removable, so that patches could be made.

Less Firebrick with Insulation

Another operator found it necessary to take down the side walls to put on insulation. Because of his clearances he took away enough of the fire-brick lining to make room for the Sil-o-Cel. Another man reported a furnace insulated and plated in, but stated that the insulation does not keep the heat in sufficiently well and the plate gets too hot. The opinion was expressed that cold air infiltration, however detrimental it may be to furnace balance, keeps the walls cooler than does the insulating material. Consequently, what is done by the methods in vogue consists more in air-proofing than in insulation.

One man, who has had all of his furnaces insulated, reported a producer gas consumption equivalent to 520 lb. of coal to the ton of ingots, everything included. He stated that this is a bit below the previous consumption, before the furnaces were insulated.

Purpose of a Venturi Port

ONE operating man reported great satisfaction from the use of a Venturi port on a producer-gas furnace. He stated that one such furnace which he had seen, and in which the regenerators were insulated and plated in, had its checkers so hot that they appeared around 2600 deg. Fahr. This led to the query from another man as to what refractories would stand that temperature.

A Canadian plant reported having to rebuild a flat roof over the gas port after 230 heats, out of 375 heats made in the entire run, with a Venturi port. The cross-sectional area at the knuckle was said to be 22 sq. ft. in a furnace having 40 sq. ft. for the air uptake and 5 sq. ft. for the gas.

William D. Pugh of the research department, English Steel Corporation, Sheffield, England, reported that the first Venturi port ever installed in an English furnace is now being put in.

One operating man described the Venturi port principle as an effort to approach the aspirating principle on the ingoing end and obtain a pre-mix of air and gas and, at the same time, on the outgoing end, not to oppose much resistance to the exit of the gases. High-velocity gas draws in air in the stream of gas and thus produces a good mix. With poor combustion, however, this flame would be likely to burn out the port at the outgoing end.

One Damper, or Several?

GOOD regulation is reported for furnaces which have separate dampers for each checker chamber and no main stock damper whatever. These furnaces, with their four dampers, appeared to give better regulation than obtained by the use of a stack damper; they have larger regenerators than in the latter case. In another plant where each chamber has its own damper there is also a main damper. Each chamber is regulated separately, resulting in keeping a more uniform temperature in the regenerators. Unless this is done the gas chambers get hotter than on the air side.

Blaw-Knox valves are used in another plant, giving different openings for the gas and the air; this is found to be very beneficial. The valves are governed through the use of recording pyrometers. There is a stack damper which is lowered in making bottom with the dolomite machine. Consequently little heat is lost through the regenerators at this time.

Flames Sweeping Wall or Roof

WHAT causes a flame to sweep along the back wall or to hang to the roof is a question which was discussed by several speakers. One man reported that, with a sloping back wall, the first part of the furnace to fail is along the skewback. It was found necessary, after about 125 heats, to put in a patch measuring about 3 x 8 ft.

This experience was verified by another man who stated that, particularly in the early part of the heat, that part is the hottest portion of the furnace. With light scrap piled up, the gases have to find their way to the outgoing port and take the line of least resistance. It was stated that we might increase the velocity of the gases and decrease the draft by reducing the amount of air which comes in through the front of the furnace and pushes the flame toward the back.

The opinion was expressed that reflection from the sloping backwall to the roof was responsible in part for the fact that it is necessary to put on a patch earlier with the sloping backwall than with the straight wall. Several speakers concurred in this view. In one case the rear skewback was raised and considerably more life was obtained from the backwall.

To obviate this trouble, particularly in furnaces which are filled up full with light scrap, one operator had the ports brought nearer the front of the furnace than their usual center-line position. This did not help; he then raised the skewback at the rear and obtained some benefit. One man reported, however, that he does not believe the trouble can be entirely obviated. A partial remedy was suggested, consisting in keeping the bridge wall low and consequently keeping the flame down nearer the bath.

Sloping or Inclined Port Roofs

WHY American furnaces must have sloping or inclined port roofs for directing the flame, whereas several efficient European furnaces have practically a straight roof, with only the gas roof pointing toward the bath, was a question which came up for extended discussion. One operator expressed the view that the roof has little or nothing to do with controlling the direction of the gas. He uses very little slope to his roofs. He stated, however, that the pitch of the port floor is the real answer, short ports needing a sharper pitch than long ones. With a Venturi port the pitch is only ¾ in. to the foot.

Producer gas furnace life was stated by this speaker to be measured by the life of the air chamber, which, in his practice, runs from 200 to 275 heats. The opening is 54 sq. in. and the checkers get very dirty. Using tar as fuel in the same furnace increases the life by about 75 heats.

One plant, using roofs which are straight from end to end, reported getting 400 heats in a campaign. The superintendent of this plant expressed the opinion that he would not get so many if his roof were sloped.

Recovery and Replacing of Checker Brick

PRACTICE in one plant was reported to be the recovery of about half the checker brick on a general repair. All of the brick are taken out and the new brick, half the total amount, are placed in the bottom. This results in scrapping at each repair the brick which have been used twice; that is, those which were put new into the bottom of a chamber and on the next repair into the top. This has to do with the air chamber only, as the gas chamber is built all of old brick.

Another plant, which reports 60 per cent recovery of the brick, with a single regenerator chamber at each end, takes all of the brick out each time. In this case, the new brick are placed on the top and the old brick on the bottom.

Still another plant takes out and discards the four top rows of brick after 150 to 200 heats, and scrapes and cleans all of the rest which need it. In rebuilding, the old brick are placed on top. Use of a brick-cleaning machine was reported to make it possible to straighten up brick which otherwise could not be put back into service. This gives a much better recovery of the brick.

Loftus brick, used in one plant, were reported to give about 300 heats; then the top three or four courses—the range being from one course to seven—are taken out and replaced with new. Loftus brick were stated in one case to be no improvement over the standard 4½ x 4½ x 10½-in.

Reporting for a casting plant, one man stated that he was making about

500 heats to the campaign and was putting most of the brick back in again. He expressed the opinion that some of these brick have gone through as many as 4500 heats.

Peterson brick, as indicated in the sketch, were reported to give a considerably greater bulk of brick in a given checker space than with the usual rectangular brick, and to give smaller horizontal openings. These brick, as the sketch shows, have the lower corners cut off so that they fit into each other more closely than do the rectangular units, making the openings smaller than with straight brick.

Inspection of Ladle Trunnions, Cable and Chains

SAFETY in handling heats of steel of 100 to 150 tons was discussed in some detail, with regard both to the size of trunnion on the ladle and inspection and renewal of the cables or chains on the crane. Such inspection is made in one plant regularly every four months, regardless of the rate of operation. Another plant makes this inspection every three months at a regular date. In still another case the cables are changed every six or seven months on the basis of the tonnage which has been handled. Another plant changes the cables when they begin to show signs of stretching. A stretch of ⅛ in. in a 7-in. length can be determined readily, and these changes occur about once a year.

Change of cables yearly was reported by another plant, each crane having handled about 200,000 tons of ingots during that interval. This plant reported having had trouble some years ago with a cast steel hook, which cracked. The plant has now standardized on laminated hooks made of steel plate for all ladle cranes. Another plant of the same company, which makes a practice of changing the cable yearly, had a narrow escape from an accident some time ago. One of the main cables broke, but the craneman saw it begin to unravel and was able to set the loaded ladle down by aid of the safety cable without spilling any steel.

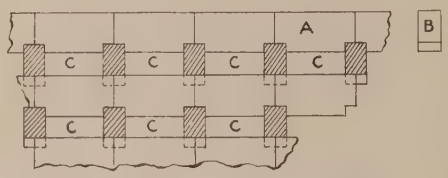
Several Breakages Reported

Another case was reported where weekly inspection of cables is in vogue. In this instance, a cast steel hook broke and the ladle came down. It did not tip over, however, and was picked up and the steel poured by means of another crane. This heat was dropped about 5 ft. straight down, as the second hook broke immediately after the first one let go. There was no running stopper.

One plant had a less fortunate experience, in having a cast steel hook break and tip the ladle over into the pit. In another case the drum shaft on the crane broke and dropped the ladle without tipping it over. This steel froze in the ladle, as it was out of reach of the other crane. In another case the U-bolt holding the cable broke and dropped the ladle, with the result that the heat was lost.

Trunnion Diameters

Trunnions 10 in. in diameter with 60-ton heats are used in one plant. In another case 10½-in. trunnions were put on 100-ton ladles and are now handling 145-ton heats. Still another plant uses 10-in. trunnions for 60-ton heats and 12-in. for 140 tons. Another one uses 10½-in. for 100 tons, but 12-in. diameter is used for the same size heat in a different plant. This plant has gone to nickel steel for the trunnions for 120-ton heats, in which 12-in. diameter is used, but 14-in. is being put on later ladles. This same 14-in. diameter is employed by another plant with heats of more than 100 tons in each ladle of steel.



Checker Brick Laid Up for Great Bulk in Limited Space. **A** and **B** are side and end views. The openings **C C** are smaller than with straight brick

Inspection of trunnions is customary at frequent intervals in one plant, beginning with a wash with coal oil. Hair-line cracks have been found in some cases on the top sides, due to hot slag running over the edge of the ladle. When these ladles were remade to avoid this trouble the cracks stopped appearing. Some trunnions which were broken have been removed and the cracks were found to be pretty deep. In another plant, where 14-in. trunnions are used, they are inspected daily by the steel mill force and monthly by the mechanical force.

Stopper Heads of Graphite and Clay

No report of the use of stopper heads of combined graphite and clay was made from any American plant. William D. Pugh, however, of the English Steel Corporation, Sheffield, reported using a nozzle of magnesite and clay, the latter being at the bottom. In this case pouring is done through a box; hence, the speed of pouring does not make much difference. His plant has found, however, that for high-manganese steel—13 per cent or so—a magnesite nozzle is the only one which will stand up. Clay used here cuts out too rapidly.

Lining and Drying Ladles

DRYING with oil, after lining and also at weekends, was reported in one castings plant to be all the heating the ladles are given. They are used in such rotation that they do not lose the heat imparted to them from the steel, before being again employed. About 19 heats to the lining are obtained in 25-ton ladles used every 5 hours. Even the nozzles are not heated after being set, as the heat of the ladle is sufficient to dry them.

Another operator reports using oil for 1 hour to dry the ladle after lining, but others are using 4 to 5 hours, especially when drying with a slag pot.

Heats obtained for each lining seem to vary considerably among the different plants. In one case, where coke-oven gas is used for drying, the October average was only 14 heats of 147 tons each. In two other cases, however, where a large amount of soft steel is made, as much as 25 heats is the average.

Circular clay brick are used in one of these cases on a ladle of 100 tons capacity, in which the steel is tapped at a temperature in excess of 3000 deg. This is for bottom pouring practice from a 3-in. nozzle and about 12 in. of slag is carried on top of the steel. Pouring of 24 ingots in a group takes about 30 min. In this same plant, with a different type of brick, only 12 heats were obtained, but sometimes with the present arrangement as many as 35 heats are made, with the aid of a patch after the first half of this run. This lining is allowed to wear away about 3 in. before a relining is made.

Desirable Type of Soaking Pits

NEW soaking pits, using producer gas and now about eight months old, were reported to be fitted with recuperators made of refractory material. Without definite data, the opinion was expressed that these pits take no more fuel than regenerator pits and possibly a bit less; they are causing no trouble. They give a more uniform heat from one side to the other than do the regenerator type, but the heat is less uniform top to bottom.

While the steel in these pits is washed a little, there is not enough of this action to cause difficulty in rolling. It is given a long soak because of the difference between top and bottom temperatures, and it heats a little faster than does the regenerator type. The ingots used are 20 x 22 in. and weigh 7000 lb. Eight are put in a pit and they are heated from cold steel in about 8 hours.

Recuperator-Type Pits

A fuel engineer reported that the tops of ingots in the recuperator-type pits heat much faster than the bottoms; consequently, it is practice to reduce the gas for a period to equalize the temperature. Reduction of the flame temperature results in more uniform heating.

Better control of heating conditions in recuperator types was reported by one operator because of the fact that each hole has a separate valve. The same condition was reported for furnaces with Isley control.

Confidence Restored Says President

Message to Congress Urges Public Building Works, Road Construction, Canalization of Waterways, Quick Action on Tariff and Income Tax Reduction

WASHINGTON, Dec. 4.—Devoted to a wide range of national and international subjects and making recommendations for legislation concerning many of them, including tax reduction of $160,000,000 for the calendar year 1930, President Hoover, in a message of approximately 11,000 words read at the opening of the second session of the Seventy-first Congress today, expressed the conviction that confidence has been reestablished. He declared that a very large degree of industrial unemployment and suffering has been prevented by the measures taken by voluntary cooperation between the Government and business institutions. Agricultural prices were declared to have reflected the returning confidence.

"The measures taken must be vigorously pursued until normal conditions are restored," he told Congress.

The recommended tax reduction program follows that given out recently by the Treasury Department. The President said, however, that in view of the uncertainty in respect of future revenues and the comparatively small size of the indicated surplus of 1931, estimated at about $123,000,000, relief should take the form of a provisional revision of tax rates.

"I recommend that the normal income tax rates applicable to the income of individuals for the calendar year 1929 be reduced from 5, 3 and 1½ per cent, to 4, 2 and ½ per cent, and that the tax on the income of corporations for the calendar year 1929 be reduced from 12 to 11 per cent," said the President. "It is estimated that this will result in a reduction of $160,000,000 in income taxes to be collected during the calendar year 1930. The loss in revenue will be divided approximately equally between the fiscal years 1930 and 1931. Such a program will give a measure of tax relief to the maximum number of taxpayers with relatively larger benefits to taxpayers with small or moderate incomes." Chairman Hawley, Ways and Means Committee, introduced a tax reduction bill in the House on Monday in line with the President's recommendation.

Asks for Early Action on Tariff

In pursuing his limited tariff revision program, President Hoover told Congress it would be most helpful if action should be taken at an early moment, more especially at a time when business and agriculture are both cooperating to minimize future uncertainties. It is just, he said, that they should know what the rates are to be.

No Conflict of Regional Interests

The President declared that there is no fundamental conflict between the interests of the farmer and the worker. Lowering of the standards of living of either was said to tend to destroy the other. The prosperity of one was held to rest upon the well-being of the other. Nor is there any real conflict between the East and the West or the North and the South in the United States, it was said. The complete interlocking of economic dependence, the common striving for social and spiritual progress, "our heritage as Americans and the infinite web of national sentiment, have created a solidarity in a great people unparalleled in all human history," the President declared. "These invisible bonds should not and can not be shattered by differences of opinion growing out of discussion of a tariff."

Public Building Work Urged

Taking up the subject of public buildings, the President recommended that consideration should be given to the extension of authorization both for the country at large and for the District of Columbia again distributed over a term of years. It was stated that a survey of the need in both categories has been made by the Secretary of the Treasury and the Postmaster General. It would be helpful, the President said, in the present economic situation if such steps were taken as would enable early construction work.

The President explained in opening discussion of the subject that under the provisions of various acts of Congress $300,000,000 has been authorized for public buildings and the land upon which to construct them, being $75,000,000 for the District of Columbia and $225,000,000 for the country at large. Excluding $25,000,000, which is for the acquisition of land in the so-called "triangle" in Washington, this public building legislation, the President pointed out, provides for a five-year program for the District of Columbia and an eight or nine-year program for the country at large. Of this sum, approximately $27,400,000 was expended to June 30 last, of which $11,400,000 has been expended in the District and $16,000,000 outside.

Treating the subject of the waterways and flood control, the President said that the development of inland waterways has received new impulse from the completion during the year of the canalization of the Ohio to a uniform depth of 9-ft. The development of other segments of the Mississippi system should be expedited, he said, and with this in view he recommended an increase in appropriations for rivers and harbors from $50,000,000 to $55,000,000 per annum, which, together with about $4,000,000 per annum released by completion of the Ohio, should make available, after providing for other river and harbor works, $25,000,000 to $30,000,000 per annum for the Mississippi system and thus bring it to early completion.

Road Program 50,000 Miles a Year

Dealing with highways, the President said that while proper planning should materially reduce the listed mileage of public roads, particularly in the agricultural districts, and turn these roads back to useful purposes, it is evident that road construction must be a long-continued program. Progress in improvement, the President said, is about 50,000 miles of all types per annum, of which some 12,000 miles are of the more durable type. The total expenditures of Federal, State and local governments last year for construction and maintenance, it was stated, assumed the huge total of $1,660,000,000.

"Federal aid in the construction of the highway system in conjunction with the States has proved to be beneficial and stimulating," President Hoover declared. "We must ultimately give consideration to the increase of our contribution to these systems, particularly with a view to stimulating the improvement of farm-to-market roads."

Progress in Civil Aeronautics

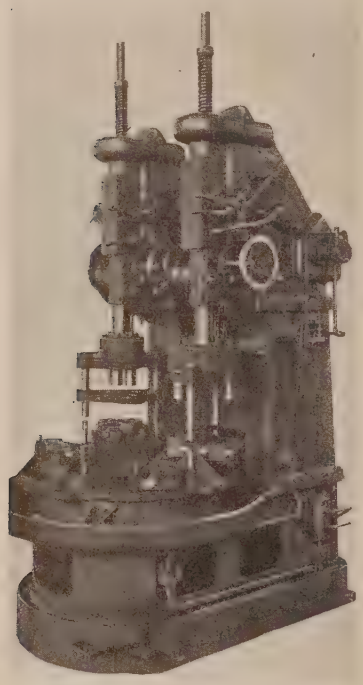
During the past year progress in civil aeronautics, the President said, has been remarkable. Government-improved airways now exceed 25,000 miles, more than 14,000 miles of which will be lighted and equipped for night-flying operations by the close of the current year, it was stated. There are now 1000 commercial and municipal airports in operation with an additional 1200 proposed for early development, the President pointed out.

"Through this assistance, the Nation is building a sound aviation system, operated by private enterprise," Presi-

(*Concluded on page* 1565)

Production Gang Drill with Hydraulic Indexing Table

A NEW two-spindle production gang drilling machine having a one-piece base and built-in rotating hydraulically controlled table has been placed on the market by the Barnes Drill Co., Rockford, Ill. The table may be of three or four-station type. The entire hydraulic mechanism is in-



The Hydraulic Indexing Three-Station Rotating Table with Foot Control Is a Feature. The table has a wide chip trough and a pusher which sweeps chips into a receptacle at the rear

closed within the frame of the machine.

Other new features include inclosing the spindle sleeve and spindle between the upper crown-gear housing and the spindle sleeve bearing in each gang head. This construction eliminates the possibility of chips getting on the spindle sleeve and scoring its bearing, and makes possible the self-oiling of the spindle in its sleeve. There is a split bearing for the spindle sleeve, the bearing cap being made of Gunite metal. The spindles and sleeves are made of Nitralloy, and are heat treated by the nitriding process after machining and grinding. The nitrided case penetrates some 1/32 in. deep, and provides an unusually hard surface. This heat treatment makes it possible to apply roller bearings in recesses in each end of the spindle sleeves, the rollers making contact directly on the spindle and the sleeve recesses, with no case or raceways for the rollers. In this way the overall diameter of the spindle sleeve is kept at a minimum.

Another new feature is the sweeper fastened to the under section of the rotating table. This device pushes the chips into a steel pan at the rear, the pan being perforated so that the coolant may pass into the reservoir base of the machine. The chips are left in this receptacle, which may be emptied conveniently by sliding it out from the rear of the gang column.

The speed-change transmission and the spiral crown gears have Timken taper roller bearings, while the drive shaft and handwheel shaft have radial ball bearings.

The first spindle of the machine illustrated is equipped with cam feed, giving rapid approach, then feed at a predetermined rate, dwell for facing, and a quick return. The second spindle has a similar cam feed, adaptable both for reaming and tapping, according to the set-up. Two of the pieces shown are bored simultaneously in the first station under multiple heads equipped with guide bars, while others are being reamed in the second station or in some operations tapped.

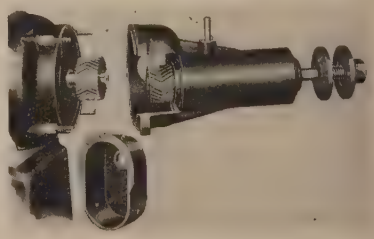
The machine shown is equipped with six-splined spindles and has drilling capacity of 2 in. in mild steel. Each gang head swings 24 in. and the spindles are spaced 28 in. center to center. The diameter of the master indexing table is 54 in. It requires only about 4 sec. to hydraulically index the table, and when the table has been indexed the hydraulic mechanism automatically actuates the throwing of the clutches and simultaneously starts the spindles upon another cycle of operations. The duty of the operator is merely to reload the spare station and actuate the foot pedal.

Polishing Lathe Has Herringbone Gear Drive

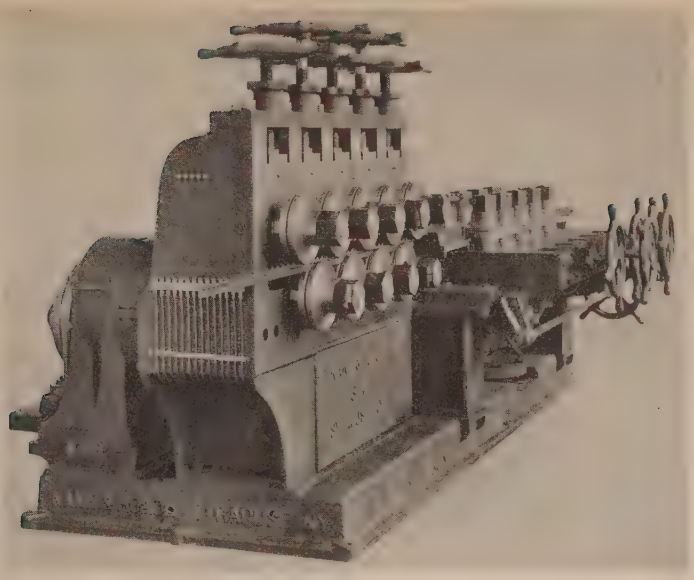
USE of continuous-tooth herringbone gears is a feature of a new motor-driven polishing lathe manufactured by the Mitchell Engineering Co., Springfield, Ohio, and marketed by Frederic B. Stevens, Inc., Larned and Third Streets, Detroit. The teeth of the gears are cut at a 40-deg. helical angle to assure quiet operation and maximum tooth contact. These gears have 2-in. width of face and are capable of transmitting 25 hp.

Each spindle bearing housing, with spindle and bearings, is an independent unit that can be removed without disturbing the motor or motor bearings. The motor shaft is carried on two ball bearings independent from the spindle bearings, an arrangement intended to eliminate undue strain and vibration from the motor bearings and to eliminate the possibility of damage to the motor by the rotor striking the fields or stator should the spindle bearings wear out. Each spindle is mounted on two ball bearings. Driving gears are of bronze, while the driven gears, on the spindles, are of steel. The former are keyed to the motor shaft by means of a feather key which permits the rotor to float to its magnetic center. Gears are completely incased and run in oil.

One spindle may be operated at one speed and the other spindle at a different speed. Eight spindle speeds ranging from 1800 to 3000 r.p.m. are obtainable. The spindles are well to the front of the machine, giving a straight-line front, and the length of the spindles overall is 56 in. They are 2 in. in diameter in the bearings and 1, 1¼ or 1½ in. in diameter between flanges. The distance between wheels is 45 in. The distance from the tight flange to the side of the machine is 16½ in. A 3, 5, 7½ or 10-hp. inclosed fan-cooled motor is employed. The size of the base at the floor is 20 x 22 in. The net weight of the machine is 700 lb.



EACH Spindle, with Spindle and Bearings, Is an Independent Unit, as Shown Above. This unit can be removed without disturbing the motor or motor bearings



New Line of Combination Roll Straighteners

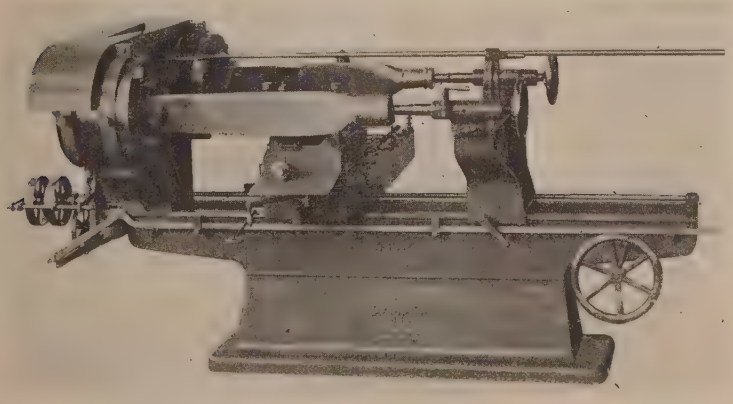
COMBINATION vertical and horizontal roll straighteners are now being built by Kane & Roach, Inc., Syracuse, N. Y., in seven sizes, comparable in capacity to the corresponding sizes of the company's eight-roll straighteners. Both the horizontal and the vertical roll shaft units are furnished with 8, 10, 12 or 16 rolls each, and can be supplied in any combination of straightening units.

These machines are designed for use where a high degree of accuracy and straightness is required, the combination of horizontal and vertical rolls enabling a larger percentage of material to be straightened within the limits required in one pass through the rolls. Roll shafts are of chrome-manganese steel and are accurately ground. Reduction and drive gears, also of alloy steel, have cut teeth, and where necessary they are heat treated. They run in oil-tight gear boxes. Drive pinions are cut from the solid and are heat treated and ground. Alemite system of lubrication is regularly furnished, but other systems can be furnished.

Delivery speeds of these machines range from 60 to 300 ft. per min. The rolls are designed for handling rounds, flats, squares, angles, U-bars, hexagons, octagons, channels, I-beams, rails, pipe, and for other special shapes.

Lathe for Wood and Aluminum Airplane Propellers

FOR turning the flat winding portion of aluminum airplane propellers, wood blade propellers and struts the Defiance Machine Works, Defiance. Ohio, is offering the propeller turning lathe here pictured. This machine, designated as the No. 613, can also be used for the production of other irregular-shaped pieces not exceeding 5 ft. in length and 12 m. in diameter. It is an adaptation of the company's copying lathe which produces facsimiles of the models used, producing both right and left-hand pieces from the same model. By simple adjustment either end of the work or the entire piece can be made larger or smaller than the model.



Although Designed for Propeller Blades, the Machine Can Be Used for Other Irregular-Shaped Parts

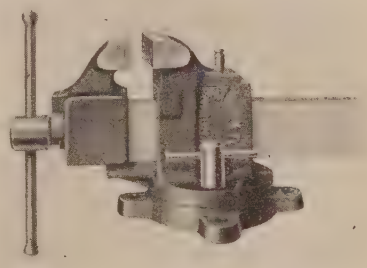
The screw feeding mechanism, which controls the cutter-head carriage, is arranged to feed from right to left and vice versa or in one direction only. It has five changes of feed, from ⅛ in. to ⅜ in. to each revolution of the work. It can be started or stopped instantly at any position of the cut. At the lowest rate of feed it will turn 2½ in. per min. and at the highest rate 13 in. per min.

When turning aluminum alloy, a 12-in. diameter 1⅜ in. circle nose-type special-tooth milling cutter is used. This is mounted on the sliding frame and supported by the carriage which travels across the path of the material, being turned by means of a heavy feed screw driven by double friction pulleys. The feed is engaged by means of a convenient hand lever, and is disengaged automatically at the end of the cut. A hollow chuck is supplied on both pattern and turning sides of the machine. At the tailstock end the propeller is held with a center provided with ball bearing thrusts.

Equipment includes a milling cutter with a tracing roll, and a countershaft. The machine occupies a floor space of 76 x 120 in. and weighs 4260 lb., net.

Vise With Back Jaw That Swivels

WITH the back jaw made in two parts, the top member of which swivels, the vise here illustrated is



The Top Part of the Back Jaw Is Free to Swivel, But It May Be Locked When the Swiveling Feature Is Not Needed

adapted for holding irregular-shaped pieces. When the swiveling feature is not desired, the top member may be locked to the back jaw by a pin.

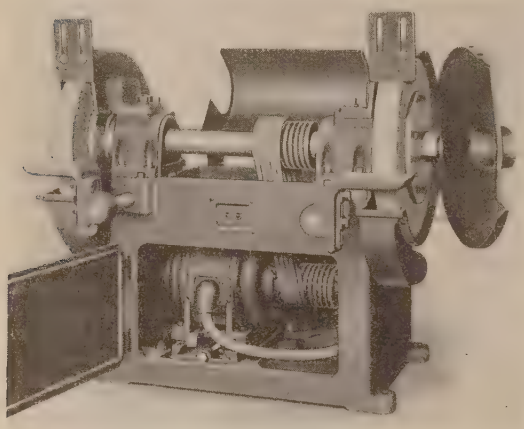
This vise, a product of the Simplex Tool Co., Woonsocket, R. I., is made with a steel slide, the sliding member of the front jaw being machined out of a solid steel bar. The nut that operates the vise screw is designed so that it cannot lift up at the back, this avoids binding of the screw which would limit the gripping power and make both the screw and the nut susceptible to breakage. The removable jaw inserts are doweled. as well as screwed on.

The combined deliveries of brass and bronze ingots and billets by the members of the Non-Ferrous Ingot Institute for October were 7726 tons.

Snagging Grinder Built in Single and Multi-Speed Types

SINGLE and multiple-speed, high-speed snagging grinders equipped with Texrope drives have been added to the line of the Hisey-Wolf Machine Co., Cincinnati.

The single-speed machine is built in three sizes, with 24, 20 and 18-in. diameter wheels and spindle speeds of 1550, 1800 and 2000 r.p.m., respectively. It is recommended for use in banks of three, or multiples thereof, so that as the grinding wheels become worn they can be transferred to machines operating at higher spindle speeds.



THE Drive Is by Texrope from the Motor in the Base. A safety device assures that the speed of the multi-speed grinder will not go below 7500 ft. per min. nor above 9500 ft. per min.

Equipped with a 10-hp. motor, the multi-speed machine is designed to use a 24-in. wheel operating at 9500 surface ft. per min. When the wheel is worn to 20 in. the spindle speed may be increased to 1800 r.p.m. by moving the wheel guards back to permit the safety device to be shifted and the Texrope belts to be transferred to the smaller driven pulley. With the belt on the smaller pulley the wheel speed is raised to 9500 surface ft. per min. The combination speed-change safety device automatically assures that the wheel speed will not drop below 7500 surface ft. per min., nor be increased above 9500 ft. per min., the maximum safe speed.

The motor is ball bearing equipped. It is mounted on a sliding base and is moved backward and forward by means of a screw to secure proper belt tension and accurate alinement of the motor. The motor starter is incased in a steel cabinet inside of the column, as a protection against dirt and grit, and is accessible through the large front door. Special attention has been paid to mounting the wheel guards, which are made of heavy boiler plate. The guard doors are hinged to facilitate changing wheels and the guards are adjustable to conform to wheel wear. Bearing boxes are keyed to the column and the spindle and bearing housings are assembled as a unit. The spindle is made of heat-treated chrome-nickel steel and runs in oversize ball bearings at each end, Timken bearings being optional. A heavy adjustable steel chip breaker is mounted on each wheel guard.

The machine is rugged and compact, with the spindle mounted forward of the center to give ample foot room for the operator. The single-speed machines are equipped with a 5, 7½ and 10-hp. motor, and weigh 2200, 2325 and 2430 lb. respectively. The weight of the multi-speed grinder is 2525 lb.

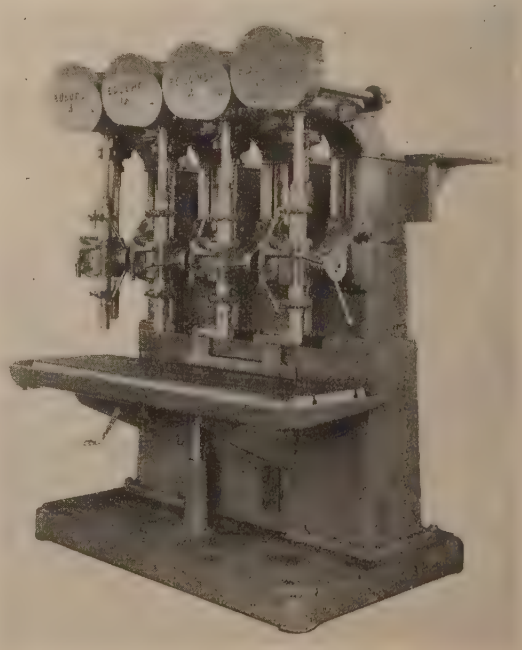
Production Drilling Machine

EDLUND MACHINERY CO., INC., Cortland, N. Y., has announced the manufacture of a 24-in production drilling machine capable of drilling 1½ in. diameter holes in steel. This machine, known as No. 1A in the company's line, may be built up to four spindles and may have riser blocks, if required. Hardened steel change gears, broached with two keys to avoid loose parts, are used. The jackshaft which carries the large change gear also carries a spiral bevel pinion which drives a gear mounted on a four-spline broached sleeve. This in turn drives the spindle. The spindle assembly is similar to that on the company's No. 4B machine.

The motor is mounted on a sliding bracket so that it can easily be removed and another put in its place. The necessary adjustments to line the motor shaft and the drive shaft can be made without the use of shims. The motor is connected to the drive shaft through a flexible coupling which takes care of any slight inaccuracy of alinement.

The power feed is driven through a train of gears with the change gears at the top, so that feeds ranging from 0.006 to 0.028 in. can be obtained. The sliding arm and power feed worm gear box assemblies are the same as on the company's No. 4B machine. The machine is open in the back to permit the use of extra counterweights for multiple head drilling. These weights can be taken off or put on as required. When a coolant system is desired, a bracket carrying an independent motor-driven pump is mounted on the side of the base. The machine is furnished with either hand or power feed, but not with tapping attachments. Spindles may have either No. 3 or No. 4 Morse tapers and may be flange quilled, if required.

Insulated Top Co., 1035 Fulton Building, Pittsburgh, has sold to the Jones & Laughlin Steel Corporation the right to use its patents for the manufacture of hot tops at its three plants. The Jones & Laughlin company has been manufacturing and using these tops on a royalty basis at its South Side Works and has recently completed a new plant at Aliquippa to supply its steel making department there.



EACH Spindle Has Its Own Motor Which Is Mounted on a Sliding Bracket. Motors may be removed and replaced conveniently and alinement of motor and drive shafts made without the use of shims. A flexible coupling takes care of any slight misalinement

Bethlehem Buys Pacific Coast Plants

Acquires Control of Pacific Coast Steel Co. and Southern California Iron & Steel Co.

THE Bethlehem Steel Corporation has announced the purchase of the Pacific Coast Steel Co. and the Southern California Iron & Steel Co., and thereby follows the lead of the United States Steel Corporation in extending its operations to the Pacific Coast. Purchase of the Columbia Steel Corporation of California by the United States Steel Corporation was announced a few weeks ago.

President Eugene G. Grace of the Bethlehem company made the following announcement at San Francisco, where he is completing arrangements for the transfer of properties to Bethlehem control:

"Through one of its subsidiaries, Bethlehem has entered into agreements covering the acquisition of all the properties and assets of Pacific Coast Steel Co. and Southern California Iron & Steel Co. The properties to be acquired include steel manufacturing plants located at South San Francisco and Los Angeles, Cal., and Seattle, Wash. The plants have a steel ingot capacity of 380,000 gross tons per year and produce billets, merchant and reinforcing bars, light structural shapes, transmission towers, universal plates, light rails, tie plates, splice bars, forgings, bolts, nuts and rivets, and other miscellaneous steel products.

"The Bethlehem officials for some years past have studied the steel situation on the Pacific Coast with a view to establishing manufacturing plants in that rapidly growing section of the country. The properties to be acquired will be operated through a separate subsidiary company having an active management with headquarters on the Pacific Coast. It will be Bethlehem's policy to develop the properties to the fullest extent for local and economic production, supplementing this production with products shipped by water from Bethlehem's eastern steel plants. With this combination of resources and opportunities, Bethlehem will be able more advantageously and effectively to serve the Pacific Coast territory with a full line of steel products."

The Pacific Coast Steel Co., which owned the entire capital stock of the Southern California Iron & Steel Co., was formed in 1909. It recently completed a new bolt, nut and rivet plant. Its capital stock consists of $3,000,000 in preferred stock and $3,000,000 in common stock.

The Southern California Iron & Steel Co. has its plant at Huntington Park, Cal. It produces alloy steel and bolts, nuts and rivets, capacity for the latter being 4000 tons.

Industrial Conference at Washington

Meeting Called by Chamber of Commerce to Consider Ways of Keeping Business on Even Keel

WASHINGTON, DEC. 3.—Prominent men in the iron and steel, machinery, mining and metallurgical and construction industries will attend the conference here on Thursday of the present week called by the Chamber of Commerce of the United States at the request of President Hoover, to cooperate in mobilizing the industrial and commercial agencies of the country in the interests of sustained business activity and employment. The meeting will be held at the Chamber headquarters, and, according to responses received, will be attended by approximately 250 business men of 32 groups, among them many trade association executives.

President Hoover will open the conference. From it may grow some plan for a continuing organization as the means of contact between Government and business and as the central agency to help each line of industry keep in step with others, according the notice sent out by Julius Barnes, chairman of the board of directors, and William Butterworth, president of the National Chamber. The conference will be asked to select an executive committee or council which may be made permanent.

Representatives of the different groups will be asked to review existing conditions and prospects and appraise the possibilities for wider cooperation on the side of business itself and between business and Government "in advancing the national economic welfare and keeping business on an even keel." The conference will receive the cooperation of official agencies, particularly the Department of Commerce, which will be represented by Secretary R. P. Lamont and Assistant Secretary Julius Klein.

Among those who have accepted invitations to attend the conference are:

James A. Campbell, president, Youngstown Sheet & Tube Co., Youngstown, Ohio; L. E. Block, chairman, Inland Steel Co., Chicago; W. W. Coleman, president and chairman, Bucyrus-Erie Co., South Milwaukee, Wis.; H. G. Dalton, Pickands, Mather & Co., Cleveland; H. B. Hirsch, Belmont Iron Works, Philadelphia; Carl A. Johnson, president, National Machine Tool Builders' Association; Lloyd Kimbrough, president, Indiana Bridge Co., Muncie, Ind.; A. E. McKinstry, president, National Association of Farm Equipment Manufacturers, Chicago; Charles Piez, chairman, Link-Belt Co., Chicago; George E. J. Pistor, Hay Foundry & Iron Works, New York; H. T. Richardson, president, National Boiler and Radiator Manufacturers' Association; Ralph M. Roosevelt, president, American Zinc Institute, New York; Harold G. Smith, president, National Metal Trades Association, Chicago; H. G. Smith, president, National Council of American Shipbuilders, New York; George M. Verity, president, American Rolling Mill Co., Middletown, Ohio.

E. A. S. Clarke, New York, secretary, American Iron and Steel Institute; Owen D. Young, New York, chairman, General Electric Co.; Charles M. Schwab, New York, president, American Iron and Steel Institute; Charles F. Abbott, New York, executive director, American Institute of Steel Construction, Inc.; A. J. Lockwood, Philadelphia, president, American Steel and Heavy Hardware Association; G. H. Weiler, New York, manager, Forging Manufacturers' Association; W. W. Nichols, New York, president, Machinery Builders' Society; J. A. Farrell, New York, president, United States Steel Corporation; E. G. Grace, New York, president, Bethlehem Steel Corporation; Leonard S. Horner, New Haven, Conn., president, Niles-Bement-Pond Co.; V. G. Iden, New York, statistician, American Institute of Steel Construction, Inc.; F. J. Kulas, Cleveland, president, Otis Steel Co.; George M. Laughlin, Pittsburgh, vice-president, J nes & Laughlin Steel Corporation; A. W. Robertson, East Pittsburgh, Pa., chairman, Westinghouse Electric & Mfg. Co.; W. D. Sayle, Cleveland, president, Cleveland Crane & Engineering Co.; Henry D. Sharpe, Providence, R. I., president, Brown & Sharpe Mfg. Co.; Gerard Swope, New York, president, General Electric Co.; Myron C. Taylor, New York, chairman, finance committee, United States Steel Corporation; John A. Topping, New York, chairman, Republic Iron & Steel Co.

Chicago Employment Down Only Slightly to Oct. 15

Manufacturing industries of the Seventh Federal Reserve District report to the Federal Reserve Bank of Chicago an aggregate loss of 1.1 per cent in the volume of employment for the period of Sept. 15 to Oct. 15. This is virtually the first decline in industrial employment of the district since January, when a drop of 0.7 per cent was shown.

With the exception of June and July, when the recessions were very slight, the trend in employment has been uniformly upward during the past year, and on Oct. 15 the volume was about 5 per cent higher than on the corresponding date in 1928.

Metals and metal products lead in the gain, with employment 10 per cent above a year ago and about the same increase in payrolls. Number of wage earners on Oct. 15, as compared with Sept. 15, was 0.5 per cent less for the metals and metal products industrial group, 0.5 per cent in vehicle manufacturing plants and 2.2 per cent less in the chemical products group.

Metal Inventories Well Below 1920 Level

Illinois Manufacturers' Association Finds that Stocks of All Goods on Nov. 1 Were Comparatively Low

DATA compiled from answers to a questionnaire sent out by the Illinois Manufacturers' Association to its members show that the percentage of raw materials on hand, based on annual sales, on Nov. 1, 1929, was approximately one-half of the average on Oct. 1, 1920.

Companies stocking iron, steel and foundry products report percentage of raw materials on hand to annual sales on Nov. 1, 1929, at 3.35 compared with 7.07 per cent on Oct. 1, 1920. Corresponding figures for metal products are 5.37 per cent and 11.09 per cent, and for machinery 9.51 per cent and 19.90 per cent.

Percentage of total inventory on hand to sales for iron, steel and foundry products on Nov. 1, 1929, was 11.56 per cent and on Oct. 1, 1920, 12.63 per cent. The corresponding figures for metal products are 15.01 per cent and 27.60 per cent, and for machinery 19.67 per cent and 26.54 per cent.

	Percentage of Raw Materials on Hand to Annual Sales		Percentage of Total Inventory on Hand to Sales	
	1920 (Oct. 1)	1929 (Nov. 1)	1920 (Oct. 1)	1929 (Nov. 1)
Iron, steel and foundry products	7.07	3.35	12.63	11.56
Food products	7.76	4.33	9.40	7.13
Metal products	11.09	5.37	27.60	15.01
Machinery	19.90	9.51	26.54	19.67
Lumber and wood products	24.87	14.37	27.87	17.81
Printing	7.49	4.37	13.76	13.49
Clothing and textiles	12.20	3.20	19.94	13.71
Electrical specialties	8.23	3.08	26.86	14.60
Chemicals	4.31	0.56	15.51	5.45
Miscellaneous	11.09	6.43	21.91	13.85
Averages	11.40	5.46	20.20	13.23

The principal reasons advanced for reduction in inventory by those answering the questionnaire were improved transportation conditions and better coordination among purchasing, production and distribution departments.

The complete table prepared by the association is given herewith.

Will Buy Equipment for South African Plant

Further particulars have been learned about the iron and steel plant to be built at Pretoria, South Africa, for the South African Iron & Steel Industrial Corporation, Ltd. The site is 4500 ft. above sea level. The plant will consist of by-product coke ovens, two blast furnaces, an open-hearth steel plant and rolling mills, all complete with power house and accessory departments. Ore and coal are available within easy reach of the site. The initial production is to be about 200,000 tons a year but the plant will be laid out for easy expansion.

The International Construction Co., Ltd., 56 Kingsway, W.C.2, London, England, is heading up the committee of consulting engineers for the work, and S. L. Bengtson, managing director of that company, is at present in the United States. He will sail for Europe on Dec. 14, but will be at the offices of Barclays Bank (Dominion Colonial and Overseas Bank), 44 Beaver Street, New York, on Dec. 12 and 13, where specifications for the blast furnaces, open-hearth plant and rolling mills may be obtained.

Three sets of the complete specification for each department will be issued against a deposit of £500, to be refunded to bonafide tenderers for at least one of the sections. Bids must be made by April 12, 1930.

The rolling mill equipment will include besides the blooming mill, a rail and structural mill, a medium structural mill, plate mill and merchant and rod mill, together with soaking pits and furnaces, gas producers, etc.

Blast Furnace Merger To Be Completed Dec. 9

Details of plans for the merger of the blast furnace and coke oven properties of the By-Products Coke Corporation, Chicago; Toledo Furnace Co., Toledo, Ohio; Perry Furnace Co., Erie, Pa., and Zenith Furnace Co., Duluth, Minn., will be worked out at a special meeting of the stockholders of the By-Products Coke Corporation that has been called for Dec. 9 to consider changing the company's name and to approve contracts for the acquisition of the properties of the other furnace companies.

No new financing will be required. Stock of the Perry Furnace Co. is to be acquired in exchange for 588,419 shares of By-Products common stock; assets of the Toledo Furnace Co. for 549,161 shares and assumption of that company's obligations, and property and assets of the Zenith Furnace Co. for 102,375 shares and assumption of that company's obligations.

With common stock now outstanding, there will be 2,000,000 shares issued of the 2,500,000 shares authorized. Stockholders will also consider fixing the amount which the capital stock shall represent on the balance sheet and giving directors authority to sell unissued stock and fix the price therefor.

Some Exhibits at New York Power Show

Included among the many exhibits shown at the eighth annual exposition of power and mechanical engineering at the Grand Central Palace, New York, Dec. 2 to 7, were a number of chain transmission devices. One of these, by the Morse Chain Co., Ithaca, N. Y., featured a silent chain drive with flexible coupling, single, double and triple-reduction speed reducers and both ring and disk oiling devices.

Through the medium of a Neon lamp synchronized with the pitch travel of a chain drive in operation, a novel stroboscope effect permitted observers to see the rocker action of the joint. Another unit in operation under glass is a drive featuring a ring oiler. This delivers clean oil to the moving chain without the splash system.

The Diamond Chain & Mfg. Co., Indianapolis, showed a high-speed drive in operation in a glass inclosure. Running at 3600 r.p.m., this quadruple-strand unit demonstrated its smoothness and quietness in operation. Another exhibit consists of 11 drives using chain from ¾ in. pitch up to 2½ in. pitch at a speed of 65 r.p.m.

Carnegie to Add 10-In. Bar Mill at McDonald

The Carnegie Steel Co. has completed engineering plans for a 10-in. bar mill at its McDonald works in Trumbull County, Ohio, which will give it a total of 11 bar and hoop mills at this property. Work is to start at an early date and the mill is scheduled to be completed in 1931. The company also plans changes to its 12-in. bar mill at the Upper Union mills to enlarge the capacity.

Finding FeO in Steel

Dr. C. H. Herty, Jr., has called attention to two errors in our issue of Nov. 21 in connection with the Open-Hearth Committee report. On page 1383 the method of obtaining FeO from Al_2O_3 should read, "If we multiply the amount of Al_2O_3 from analysis by 2.11 we obtain the FeO content of the steel."

On page 1384, regarding soda ash used in the Aston process, this should read, "This is put into the cupola metal ladle before carrying it to the converter."

Harnischfeger Corporation, Milwaukee, has declared an initial quarterly dividend of 45c. on its common stock, payable Jan. 1 to stock of record Dec. 15. The regular $1.75 quarterly dividend on the preferred stock was also declared. Earnings of the company are expected to equal $4 a share, as compared with $2.81 in 1928.

This Issue in Brief

Eliminates hand labor in quenching small parts by using containers having a lug which is gripped by tongs of overhead hoist. Containers need no longer be hooked and unhooked.—Page 1506.

* * *

Non-rusting steel discovered by German scientists, says German metallurgist. Strauss and Maurer found it in investigation of heat-resisting alloys, he says, and Krupp Works developed the proper heat treatment to make the metal workable.—Page 1512.
